Technology Licenses

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

U.S. Government Rights

The Software is “commercial computer software,” as defined by Federal Acquisition Regulation (“FAR”) 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement (“DFARS”) 227.7202, the US government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to US government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at http://www.keysight.com/find/sweula. The license set forth in the EULA represents the exclusive authority by which the US government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the US government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

Warranty

THE MATERIAL CONTAINED IN THIS DOCUMENT IS PROVIDED “AS IS,” AND IS SUBJECT TO BEING CHANGED, WITHOUT NOTICE, IN FUTURE EDITIONS. FURTHER, TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, KEYSIGHT DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED, WITH REGARD TO THIS MANUAL AND ANY INFORMATION CONTAINED HEREIN, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. KEYSIGHT SHALL NOT BE LIABLE FOR ERRORS OR FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH THE FURNISHING, USE, OR PERFORMANCE OF THIS DOCUMENT OR OF ANY INFORMATION CONTAINED HEREIN. SHOULD KEYSIGHT AND THE USER HAVE A SEPARATE WRITTEN AGREEMENT WITH WARRANTY TERMS COVERING THE MATERIAL IN THIS DOCUMENT THAT CONFLICT WITH THESE TERMS, THE WARRANTY TERMS IN THE SEPARATE AGREEMENT SHALL CONTROL.

Safety Information

CAUTION

A CAUTION notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

WARNING

A WARNING notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.

1 Documentation Roadmap

This section describes the Keysight products covered by this document, and provides links to related documentation.

– "Products Covered by this Document" on page 81

– "Additional Documentation" on page 82

1.1 Products Covered by this Document

For the full list of instrument models covered by this documentation, see the title page: "Spectrum Analyzer ModeUser's & Programmer's Reference" on page 1.

1.2 Additional Documentation

If your instrument or computer has an internet connection, then you can access the latest editions of all relevant X-Series documentation via the links below.

This document is available in 3 formats:

- **Embedded Help**, in the instrument
- **Online Help**, at Keysight's web site

  For information on this Mode, browse to:

  http://rfmw.em.keysight.com/wireless/helpfiles/SAMode/FlexUI.htm
- **Users & Programmers Reference**, in downloadable PDF format

  For information on this Mode, download from:

  http://literature.cdn.keysight.com/litweb/pdf/N9060-90041.pdf

The following documents are available online at keysight.com:

X-Series Messages Guide

The following documents are in downloadable PDF format:

Getting Started Guides, Instrument Messages & Security

- N90x0B Getting Started & Troubleshooting Guide
- N9041B Getting Started & Troubleshooting Guide
- X-Series Status Register System Diagram
- Security Features & Statement of Volatility

Specifications Guides

- N9000B CXA Specifications Guide

- N9040B UXA Service Guide

2 User Interface

Here are the basic elements of the Multitouch User Interface. For more information, tap a topic.

Included in this section are also topics for several front panel keys not described in other topics. Tap one of these topics for more information.

"Cancel key" on page 130

"Onscreen Keyboard key" on page 131

"Touch On/Off Key" on page 132

"Tab key" on page 133

2.1 Screen Tabs

In the X-Series Multitouch User Interface (or Multitouch UI), you can run many different Measurement Applications, or “Modes”. Examples are Spectrum Analyzer Mode, LTE-A FDD Mode, IQ Analyzer Mode, and Real Time Spectrum Analyzer Mode. Each Mode has its own set of controls, windows and SCPI commands.

Each Mode runs within a “Screen”. The Multitouch UI supports multiple “Screens” (see "Multiscreen" on page 174 for more information). Each screen displays one Measurement in one Mode. The set of configured screens is shown across the top of the display as a set of Screen Tabs, with a + tab at the right for adding new Screens:

You can see up to six tabs at a time on the UXA, and 4 at a time on the CXA, EXA, MXA and PXA. If there are more Screens configured than this, arrows appear to the left and right of the Screen Tabs; pressing the arrows scrolls the Screen Tabs to the left or right. A scroll bar also appears at the bottom of the Screen Tabs, indicating that you can scroll the tabs by dragging them with your finger; you can also scroll them by dragging the scroll bar.

Pressing a Screen Tab selects that screen for operation. Pressing the blue (selected) Screen Tab is the same as pressing the Mode/Meas front panel key.

Both actions open the "Mode/Meas/View Dialog" on page 86. In addition, if you have a PC keyboard plugged in, the sequence CTL-SHIFT-M will open up this dialog.

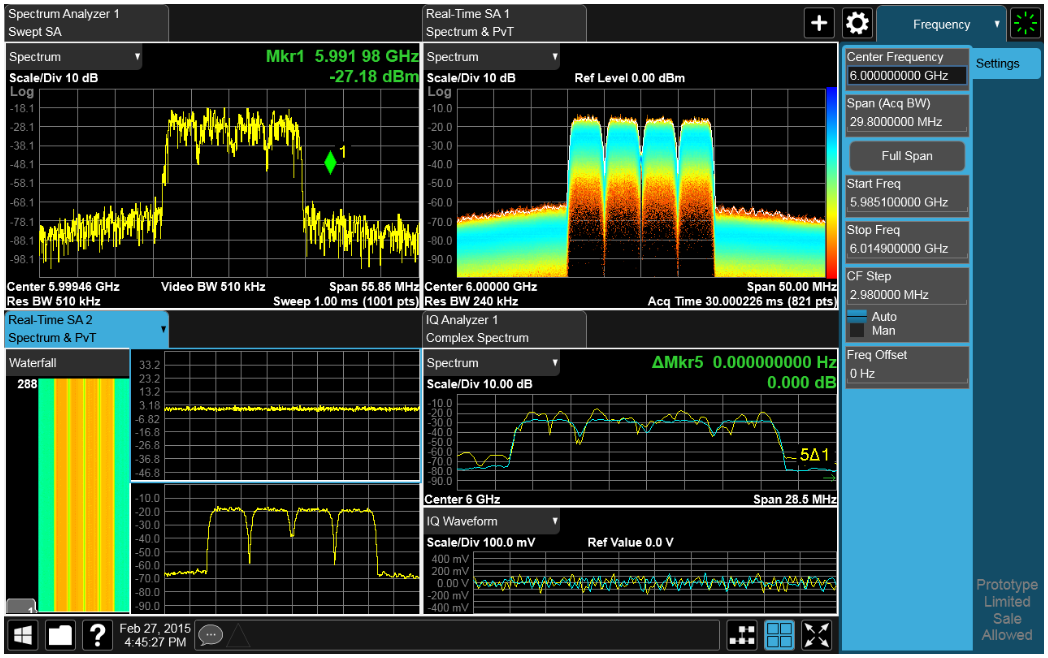
The + tab at the right of the Screen Tabs bar adds a new Screen by cloning the current screen. The new Screen has the identical setup and settings as the current Screen. You can then change the Mode, Measurement and/or settings of the new Screen.

You can define up to 16 screens at once.

Example Multiscreen View

The example below shows a four-screen display in Multiscreen view.

The Screen called “Real-Time SA 2” is selected, as indicated by its blue tab. Touching any other screen or tab selects the screen for that tab and brings it to the foreground.



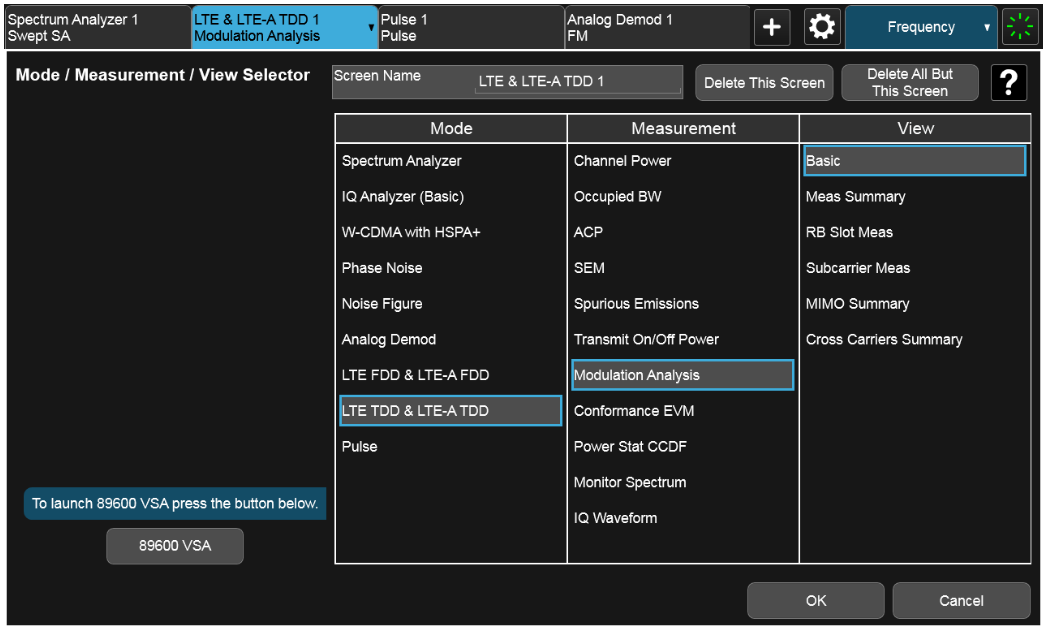
The following topics provide more information:

- "Mode/Meas/View Dialog" on page 86
- "Add Screen" on page 103
- "Multiscreen" on page 174

2.1.1 Mode/Meas/View Dialog

The Mode/Meas/View dialog opens when you press the selected (blue) Screen tab (see "Screen Tabs" on page 85) or the **Mode/Meas** front panel key.

This dialog displays lists of available Modes, Measurements and Views, as well as the "Sequencer" on page 97 control for configuring Screens.



2.1.1.1 Mode

The first column in the Mode/Meas/View dialog allows you to select the desired Mode from those currently licensed in your instrument.

Modes, also known as “measurement applications”, are collections of measurement capabilities packaged together to provide you with an instrument personality specific to your measurement needs. Each Mode is ordered separately by Model Number and must be licensed in order for it to be available in the instrument.

You select the Mode you want to run using the Mode/Meas/View dialog. Once a Mode is selected, only the commands that are valid for that mode can be executed

For more information on Modes, preloading Modes, and memory requirements for Modes, see "More Information" on page 90

The `:INSTrument[:SELect]` command is used to remotely select a Mode by sending the instrument a parameter which represents the name of the desired Mode. The Mode Names may be found in the table under "Index to Modes" on page 89.

The `:INSTrument:NSELect` command is used to remotely select a Mode by sending the Mode Number of the desired Mode. See "Instrument Number Select" on page 88. The Mode Numbers may be found in the table under "Index to Modes" on page 89.

The `:INSTrument:CONFigure` command causes a Mode and Measurement switch at the same time. This generally results in faster overall switching than sending the

:INSTrument:SELect and CONFigure commands separately. See "Mode and Measurement Select" on page 88.

Remote Command	:INSTrument[:SELect] <mode_id> where <mode_id> is one of the values listed in "Index to Modes" on page 89 below :INSTrument[:SELect]?
Example	:INST SA
Notes	A list of the valid mode choices is returned by the :INST:CAT? query
Preset	The default Mode is set to SA on **Restore System Defaults->All**, unless noted below: For N8973B, N8974B, N8975B, or N8976B: NFIG
State Saved	Saved in instrument state
Annunciation	Application Title is in the Screen Tab

Instrument Number Select

Remote Command	:INSTrument:NSELect <integer> :INSTrument:NSELect?
Example	:INST:NSEL 1
Notes	The Mode Numbers may be found in the table under "Index to Modes" on page 89 SA mode is number 1 The command is sequential: that is, continued parsing of commands cannot proceed until the instrument select is complete and the resultant SCPI trees are available
Preset	The default Mode is set to 1 by **Restore System Defaults->All**, unless noted in the table above
State Saved	Saved in instrument state

Mode and Measurement Select

Remote Command	:INSTrument:CONFigure:<mode_id>:<meas> where <mode_id> is a valid parameter for the :INST:SEL command and <meas> is a valid parameter for the :CONF command in the Mode specified by <mode>
Example	:INST:CONF:SA:SAN selects the Spectrum Analyzer mode and the Swept SA measurement :INST:CONF:WCDMA:RHO selects the WCDMA mode and the Mod Accuracy measurement
Notes	The available parameters for <mode_id> are dependent upon installed and licensed applications resident in the instrument. The available parameters for <meas> are dependent on the <mode_id> parameter and the valid measurements available for that mode, which can depend on model numbers and installed options In general this command will execute more quickly than sending the equivalent separate :INST:SEL

and :CONF commands

Index to Modes

The Mode Number in the table below is the parameter for use with the :INSTrument:NSELect command. The Mode Parameter is the parameter for use with the :INSTrument[:SELect] command. Your actual choices will depend upon which applications are installed in your instrument.

Mode	Mode Number	Mode Parameter <mode_id>
5G NR	109	NR5G
89601 VSA	101	VSA89601
Analog Demod	234	ADEMOD
Avionics	232	AVIONIC
Bluetooth	228	BTooth
Channel Quality / Group Delay	161	CQM
EMI Receiver	141	EMI
GSM/EDGE/EDGE Evo	13	EDGEGSM
I/Q Analyzer (Basic)	8	BASIC
LTE FDD & LTE-A FDD	107	LTEAFDD
LTE TDD & LTE-A TDD	108	LTEATDD
Measuring Receiver	233	MRECEIVE
MSR	106	MSR
Noise Figure	219	NFIGure
Phase Noise	14	PNOISE
Power Amplifier	81	PA
Pulse	151	PULSEX
Radio Test	300	RTS
Real Time Spectrum Analyzer	2	RTSA
Remote Language Compatibility	266	RLC
SCPI Language Compatibility	270	SCPILC
Sequence Analyzer	123	SEQAN
Short Range Comms	218	SRCOMMS
Spectrum Analyzer	1	SA
Vector Modulation Analyzer	200	VMA
WCDMA with HSPA+	9	WCDMA
WLAN	217	WLAN

More Information

The Mode name appears on the Screen Tab, followed by a number identifying which instance of the Mode appears on that screen. Each Screen contains one Mode. For example, in the image below, there is one Real-Time Spectrum Analyzer screen, and two Spectrum Analyzer screens. The current Screen contains **Real-Time SA 1**.

It is possible to specify the order in which the Modes appear in the Mode menu, using the **Configure Applications** utility on the Desktop. Using the same utility, it is also possible to specify a subset of the available applications to load into memory at startup time, which can decrease the startup time of the instrument and the amount of memory consumed.

Each application (Mode) that runs in an X-Series instrument consumes virtual memory. The various applications consume varying amounts of virtual memory, and as more applications run, the memory consumption increases. Keysight characterizes each Mode and assigns a memory usage quantity based on a conservative estimate. The **Configure Applications** utility shows an estimate for how much memory each Mode will consume.

You can still run a Mode even if it is not preloaded into memory – during runtime, the first time an application that is not loaded into memory is selected (either by pressing that application's **Mode** key or by sending that application's `:INST:SEL` command), the Application will be loaded, but this takes a few seconds. The instrument will pause while loading the application while displaying a message box that says "Loading application, please wait..." Preloading the application eliminates this wait time *but* consumes additional memory.

2.1.1.2 Application Mode Remote Commands

This section contains a number of remote commands that are provided for programming convenience and remote compatibility.

Application Mode Catalog Query (Remote Command Only)

Returns a string containing a comma-separated list of names of all the installed and licensed measurement modes (applications). These names can only be used with `:INSTrument[:SELect]`.

Remote Command	`:INSTrument:CATalog?`

Example	`:INST:CAT?`
Notes	Query returns a quoted string of the installed and licensed modes separated with a comma. Example: `"SA,PNOISE,WCDMA"`
Backwards Compatibility Notes	VSA (E4406A): `:INSTrument:CATalog?` returned a list of installed `INSTrument:SELECT` items as a comma separated list of string values, for example: `"BASIC","GSM","EDGEGSM","CDMA","SERVICE"` X-Series uses the ESA/PSA compatible query of a string contain comma separated values: `"SA,PNOISE,NFIG,BASIC"`

Current Application Model (Remote Command Only)

Returns a string that is the Model Number of the currently selected application (mode). This information is also displayed in the **Show System** screen.

Remote Command	`:SYSTem:APPLication[:CURRent][:NAME]?`
Example	`:SYST:APPL?`
Notes	Query returns a quoted string that is the Model Number of the currently selected application (Mode). Example: "N9060A" String length between 6 to 9 characters.
Preset	Not affected by Preset
State Saved	Not saved in state, the value will be the selected application when a Save is done.

Current Application Revision (Remote Command Only)

Returns a string that is the Revision of the currently selected application (mode). This information is also displayed in the Show System screen

Remote Command	`:SYSTem:APPLication[:CURRent]:REVision?`
Example	`:SYST:APPL:REV?`
Notes	Query returns a quoted string that is the Revision of the currently selected application (Mode). Example: "1.0.0.0" String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points) The format is Major.Minor.Build.Compile, where Major must correspond to the Integer portion of the Version in the license file for the application.
Preset	Not affected by a Preset
State Saved	Not saved in state, the value will be the selected application when a Save is done.

Current Application Options (Remote Command Only)

Returns a string that is the Options list of the currently selected application (Mode). This information is also displayed in the Show System screen

Remote Command	`:SYSTem:APPLication[:CURRent]:OPTion?`
Example	`:SYST:APPL:OPT?`
Notes	Query returns a quoted string that is the Option list of the currently selected application (Mode). The format is the name as the *OPT? or SYSTem:OPTion command: a comma separated list of option identifiers. Example: "1FP,2FP" String length is a maximum of 255 characters.
Preset	Not affected by a Preset
State Saved	Not saved in state per se, the value will be the selected application when a Save is invoked.

Application Catalog Number of Entries (Remote Command Only)

Returns the number of installed and licensed applications (Modes).

Remote Command	`:SYSTem:APPLication:CATalog[:NAME]:COUNt?`
Example	`:SYST:APPL:CAT:COUN?`
Preset	Not affected by Preset
State Saved	Not saved in instrument state.

Application Catalog Model Numbers (Remote Command Only)

Returns a list of Model Numbers for the installed and licensed applications (Modes).

Remote Command	`:SYSTem:APPLication:CATalog[:NAME]?`
Example	`:SYST:APPL:CAT?`
Notes	Returned value is a quoted string of a comma separated list of Model Numbers. Example, if SAMS and Phase Noise are installed and licensed: "N9060A,N9068A" String length varies based on licenses. Licenses are between 6 and 9 characters. So the string length will be between COUNt * 7 – 1 and COUNt * 10 – 1. (7 & 10 = Model Number length + 1 for comma. -1 = no comma for the 1st entry.)
Preset	Not affected by a Preset
State Saved	Not saved in instrument state.

Application Catalog Revision (Remote Command Only)

Returns the Revision of the provided Model Number.

Remote Command	`:SYSTem:APPLication:CATalog:REVision? <model>`
Example	`:SYST:APPL:CAT:REV? 'N9060A'`
Notes	Returned value is a quoted string of revision for the provided Model Number. The revision will be a null-string ("") if the provided Model Number is not installed, licensed, and loaded. Example, if SAMS is installed and licensed: "1.0.0.0" String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points)
Preset	Not affected by a Preset.
State Saved	Not saved in instrument state.

Application Catalog Options (Remote Command Only)

Returns a list of Options for the provided Model Number

Remote Command	`:SYSTem:APPLication:CATalog:OPTion? <model>`
Example	`:SYST:APPL:CAT:OPT? 'N9060A'`
Notes	Returned value is a quoted string of a comma separated list of Options, in the same format as *OPT? or :SYSTem:OPTion?. If the provided Model Number is not installed and licensed a null-string ("") will be returned. Example, if SAMS is installed and licensed: "2FP" String length is a maximum of 255 characters.
Preset	Not affected by a Preset
State Saved	Not saved in instrument state.

ESA SA compatibility command (Remote Command only)

Provided for backwards compatibility with ESA. When this command is received, the analyzer aliases it to the appropriate Mode.

Remote Command	`:INSTrument[:SELect] 'SA' | 'PNOISE' | 'EDGE' | 'GSM' | 'BASIC'`
Example	`:INST 'SA'`
Notes	The query is not a quoted string. It is an enumeration as indicated in the Instrument Select table above

GSM Mode compatibility command (Remote Command only)

Provided for backwards compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EDGEGSM`

Remote Command	`:INSTrument[:SELect] GSM`
Example	`:INST GSM`

SA compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL SCPILC`

This results in the analyzer being placed in SCPI Language Compatibility Mode, in order to emulate the ESU Spectrum Analyzer Mode.

Remote Command	`:INSTrument[:SELect] SANalyzer`
Example	`:INST SAN`

Receiver compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the instrument aliases it to the following:

`:INST:SEL EMI`

`:CONF FSC`

This results in the instrument being placed in the EMI Receiver Mode, running the Frequency Scan measurement, in order to emulate the ESU Receiver Mode.

Remote Command	`:INSTrument[:SELect] RECeiver`
Example	`:INST REC`

APD compatibility command for EMC(Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EMI`

`:CONF APD`

This results in the analyzer being placed in the EMI Receiver Mode, running the APD measurement, in order to emulate the ESU APD Mode.

Remote Command	`:INSTrument[:SELect] APDistribution`
Example	`:INST APD`

IF Mode compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EMI`

`:CONF MON`

This results in the analyzer being placed in the EMI Receiver Mode, running the Monitor Spectrum measurement, in order to emulate the ESU IF Mode.

Remote Command	`:INSTrument[:SELect] IFANalyzer`
Example	`:INST IFAN`

2.1.1.3 Measurement

The Measurement column of the Mode/Meas/View dialog shows all the Measurements available for the Mode which is selected in the first column. Select a Measurement in the second column and the View column will show all the Views available for that measurement. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

2.1.1.4 View

A View is a collection of Result Windows. The View column of the "Mode/Meas/View Dialog" on page 86 shows all the Views available for the Measurement which is selected in the second column. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

The View may also be set by using the View tab on the Display menu. The View tab is the last tab on the Display menu for every measurement. The Views are the same as those listed in the "Mode/Meas/View Dialog" on page 86.

Spectrogram
Trace Zoom
Zone Span
Restore Layout To Default
Save Layout as New View
Re-Save User View
Rename User View
Delete User View
Meas Display
Annotation
View

2.1.1.5 Sequencer

Allows multiple Screens to update sequentially while in "Multiscreen" on page 174 display mode. Each Screen updates in sequence, and when all have updated, the sequence will start again.

To start the Sequencer, you must have more than one Screen defined, and you must have Multiscreen selected (see "Screen Tabs" on page 85).

If you want each Screen to use a different input, you must turn off **All Screens Use Same Input** under **Input/Output**, **Input**.

CAUTION Differences in hardware settings between the Screens may cause switches and/or attenuators to cycle as you go from one Screen to another. This could potentially reduce the life of these components. To avoid this, make sure **Attenuation**, **µW Path Control** and other switch settings are the same in each Screen.

NOTE When the Sequencer is running, the destination of remote commands is unpredictable, so you should stop the Sequencer before sending any measurement-related commands. Once the Sequencer has stopped, select a specific Screen using `:INSTrument:SCReen:SELect`, before sending any further commands. See "Select Screen" on page 176

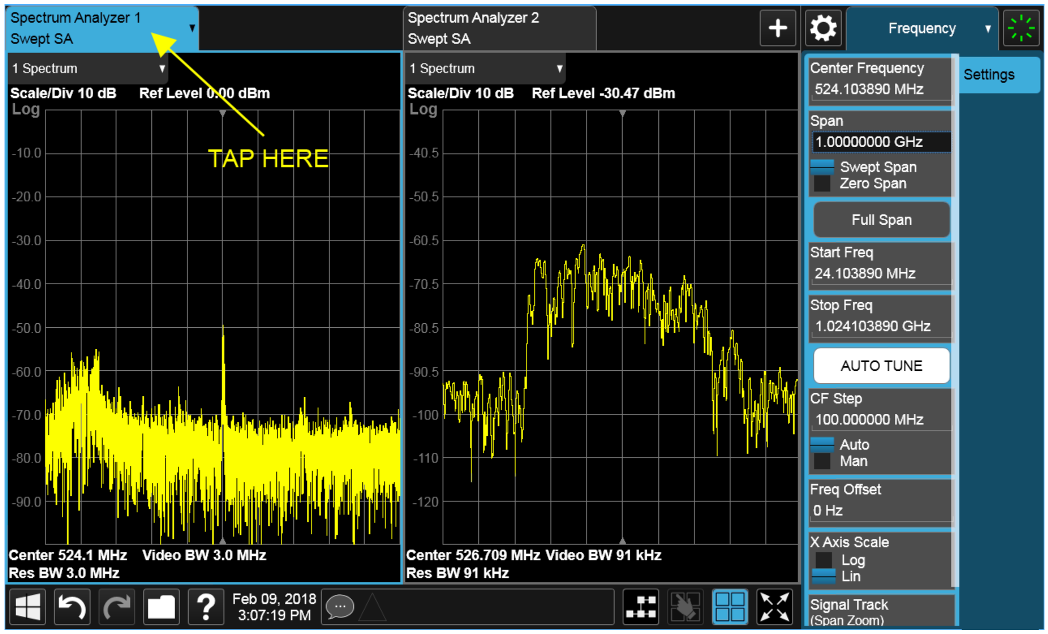
NOTE When the Sequencer is running, Auto alignment is temporarily disabled. A pending auto alignment might be executed when the sequencer is stopped.

See "More Information" on page 97

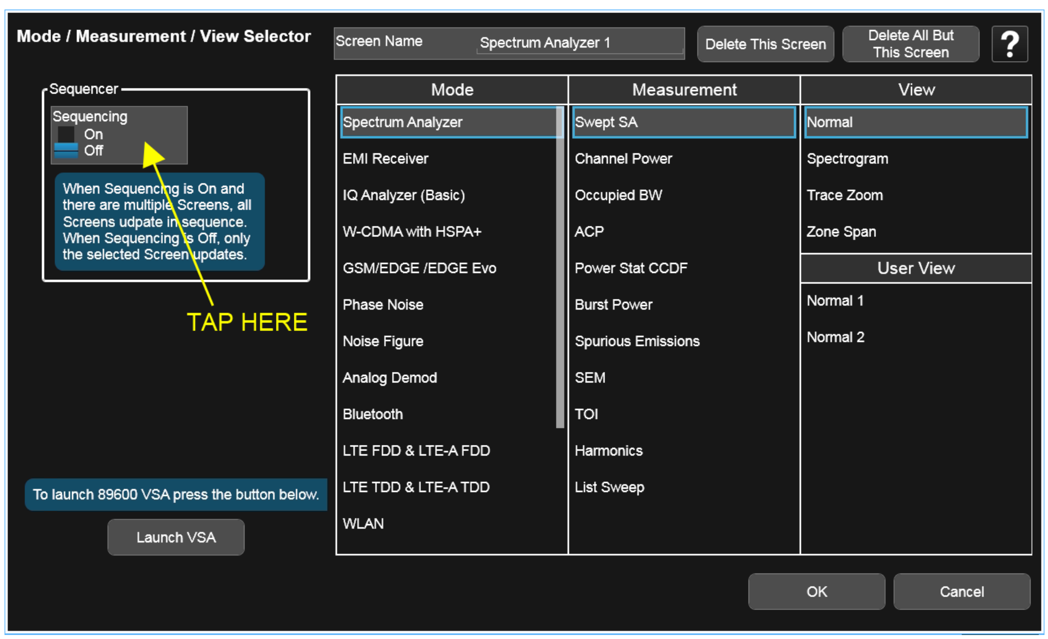
Remote Command	`:SYSTem:SEQuencer ON | OFF | 1 | 0` `:SYSTem:SEQuencer?`
Example	`:SYST:SEQ ON`
Notes	If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" is generated
Dependencies	To start the Sequencer, you must have more than one Screen defined and you must have Multiscreen selected
Preset	`OFF`

More Information

To start the Sequencer, tap the current (blue) Screen tab to go into the Mode/Meas/View Dialog:

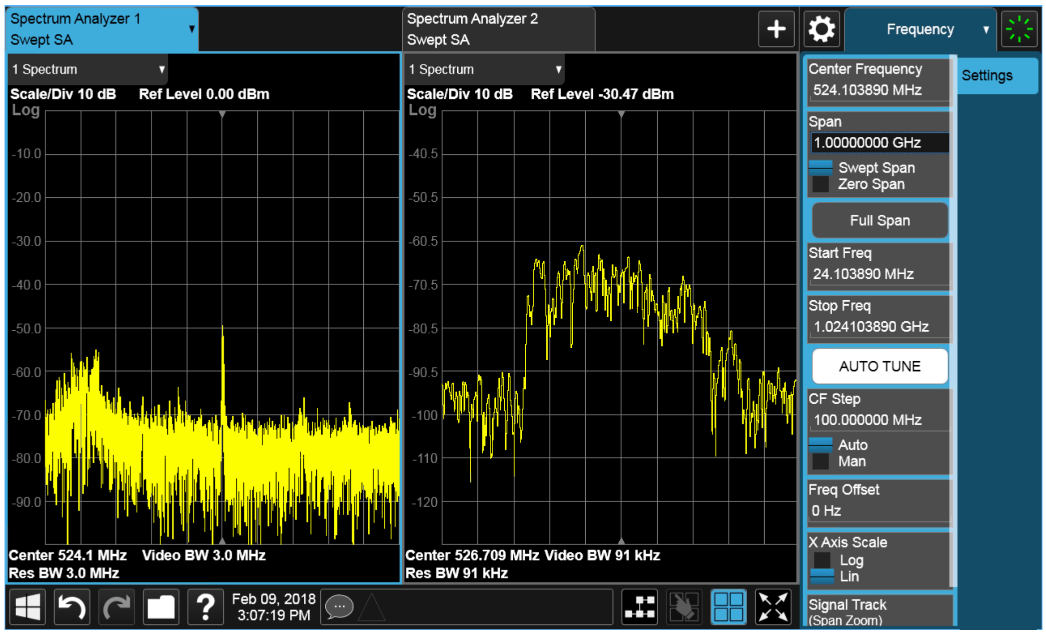


In the Sequencer block in the upper left hand corner, tap the Sequencing switch to turn it On:

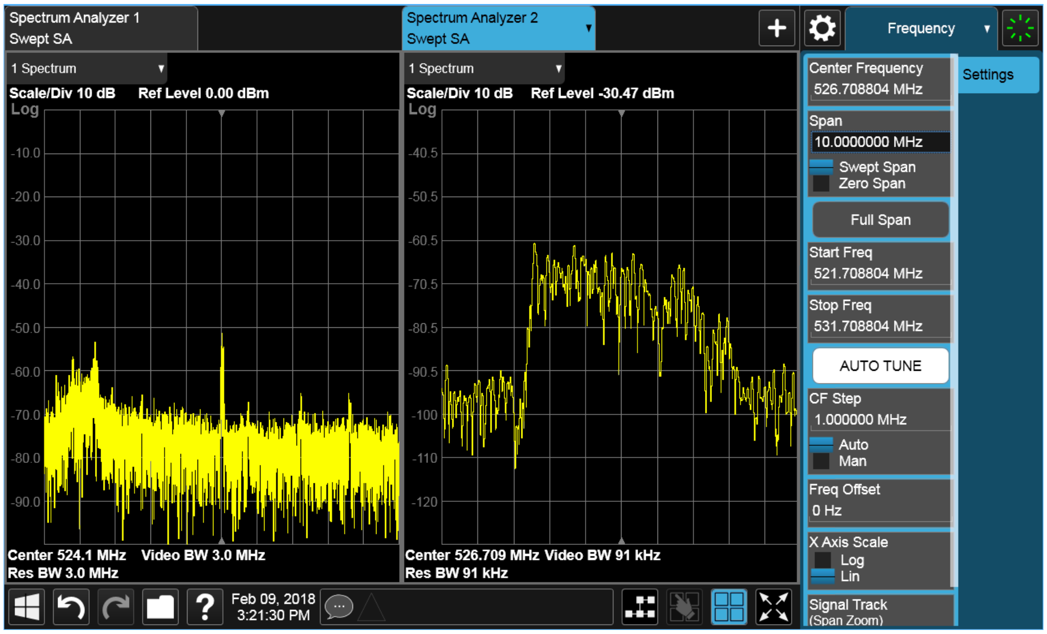


The instrument will immediately exit the Mode/Meas/View Dialog and begin making measurements in each of the screens, one after the other. When a measurement is being made in a particular Screen, that Screen's tab will be blue.

Measurement being made in Screen 1:



Measurement being made in Screen 2:



Touching any key or control on the display will cause the Sequencer to stop, so that you can make desired changes. When this happens, the message “Sequencer stopped” is displayed.

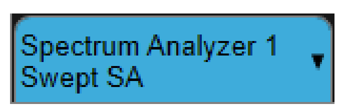
When the Sequencer is running, the screens update in the order in which they were created.

Each Screen takes one measurement then passes control to the next Screen. Each Screen updates as though it were in Single Sweep or Single Measurement mode. Thus, if Averaging is on, a Screen may take multiple sweeps before moving on to the next Screen.

2.1.1.6 Screen Name

By default, the screen name is the Mode (Application) name followed by a number indicating the instance of the application.

You may change the name displayed on the Screen Tab of any screen. The control to do this appears in the "Mode/Meas/View Dialog" on page 86:



When you touch this control an onscreen keyboard appears, allowing you to change the name. Whatever you change it to appears on the Tab, even if you subsequently change the screen to a different Mode.

To reset the name, delete the screen name entirely.

Each Screen Name must be unique; you cannot give the same name to more than one screen.

Remote Command	`:INSTrument:SCReen:REName <alphanumeric>`
Example	`:INST:SCR:REN “Baseband”`
Notes	The currently active screen is renamed. If the `<alphanumeric>` specifying the new name is already present in the list of screen names, the error message “-224, Illegal parameter value; New name <name> already exists” appears If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears

2.1.1.7 Delete This Screen

Pressing this button deletes the current Screen (the one with the blue tab). Deleting a screen removes it from view and selects the next lower screen in the list of screens. If only one screen is configured, it cannot be deleted.

If you press the **Delete This Screen** button, a prompt appears:

“This function will delete the current screen and its settings. This action cannot be undone. Do you want to proceed?”

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or **ESC** does not.

Remote Command	`:INSTrument:SCReen:DELete`
Example	`:INST:SCR:DEL`
Notes	The currently active screen is deleted If the screen you are attempting to delete is the only configured screen, the error message “-221, Settings conflict; Last screen cannot be deleted” is displayed If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated

2.1.1.8 Delete All But This Screen

Pressing this control deletes all the Screens except the current Screen (the one with the blue tab).

If you press the **Delete All But This Screen** button, a prompt appears:

"This function will delete all defined screens and their settings, except for the current screen. This action cannot be undone. Do you want to proceed?"

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or ESC does not.

Remote Command	`:INSTrument:SCReen:DELete:ALL`
Example	`:INST:SCR:DEL:ALL`
Notes	You can reset the instrument to the power-on configuration by invoking `:INST:SCR:DEL:ALL` followed by `:SYSTem:DEFault ALL` If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" appears

2.1.1.9 89600 VSA

Pressing this button launches the 89600 VSA software. The 89600 VSA software is powerful, PC-based software, offering the industry's most sophisticated general purpose and standards specific signal evaluation and troubleshooting tools for R&D engineers. Even for proprietary and non-standard signals in SATCOM or MILCOM applications, you can make signal quality measurements with customized IQ constellation.

The 89600 VSA software offers the following features:

- Over 35 general-purpose analog and digital demodulators ranging from 2FSK to 4096QAM
- Flexible and custom IQ and OFDM signal analysis for single carrier
- Standards specific modulation analysis including:
  - Cellular: GSM/EDGE, cdma2000, W-CDMA, TD-SCDMA, LTE(FDD/TDD),
  - LTE-Advanced and more
  - Wireless networking: 802.11a/b/g, 802.11n, 802.ac, 802.16 WiMAX (fixed/mobile), WiSUN (MR-FSK PHY)
  - RFID
  - Digital satellite video and other satellite signals, radar, LMDS
- Up to 400K bin FFT, for the highest resolution spectrum analysis
- A full suite of time domain analysis tools, including signal capture and playback, time gating, and CCDF measurements
- 20 simultaneous trace displays and the industry's most complete set of marker

functions

– Easy-to-use Microsoft Windows graphical user interface

For more information see the Keysight 89600 Series VSA web site at www.keysight.com/find/89600vsa

To learn more about how to use the 89600 VSA in the instrument, start the 89600 VSA software, then open the 89600 VSA Help and navigate to the topic "About Keysight X-Series Signal Analyzer with 89600 VSA Software".

Example	`:INST:SEL VSA89601` `:INST:NSEL 101`

2.1.2 Add Screen

On X-Series analyzers you can configure up to 16 different Screens at one time. Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows.

You can add screens by pressing the “+” icon in the "Screen Tabs" on page 85 panel. The icon is shown below:

Every time you add a Screen, the instrument “clones” or “copies” the current Screen into the new Screen. If desired, you can then use the "Mode/Meas/View Dialog" on page 86 to change the Mode, Measurement and/or View of the new Screen, or simply operate a second copy of your previous Screen, thus preserving the settings of your previous Screen.

When you have defined the maximum number of Screens (16), the “+” icon disappears.

For more information about operating the instrument with multiple screens configured, see "Multiscreen" on page 174.

Remote Command	`:INSTrument:SCReen:CREate`
Example	`:INST:SCR:CRE`
Notes	The maximum number of screens is 16. If an attempt to add a screen occurs when the maximum have been defined, the error message “-221, Settings conflict; Screen limit reached” appears When you create a new screen the Screen Name is the current Mode name followed by a number indicating the instance of the Mode.

If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears

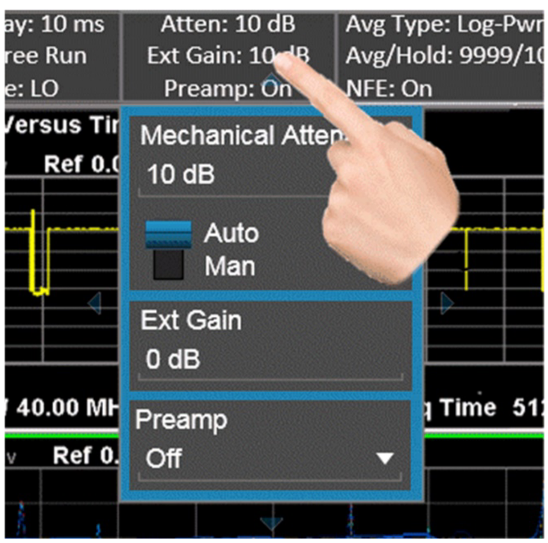
2.2 Meas Bar

The Meas Bar is used to display annotation for the current measurement. There are three primary uses for the Meas Bar:

1. To show annotation for the most important parameters in the measurement so you can see them at a glance
2. To show the annotation that you will most want to have recorded in a screen dump
3. To give you quick access to settings.

The Meas Bar is made up of a number of annotation panels, each of which, when pressed, opens up a dialog below it which contains controls for those settings.

For example, here is what the display looks like when you touch one of the regions of the Meas Bar:



Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function.

Settings that are colored amber are those that you need to be particularly aware of; for example, if Alignments are off, this is shown in amber, so you will know that you may not be meeting spec. Similarly, if DC coupling is on, this is shown amber, to alert you to be careful what voltage you put on the input.

You can turn the Meas Bar on and off with a switch on the Annotation tab of the Display menu.

System Control Panel

The leftmost panel holds the GPIB/Remote annunciators, the Single/Continuous symbol/control, the LXI indicator and the PASS/FAIL indicator. Tapping this panel drops down controls for Single/Continuous, Pause/Resume and restart.

GPIB/Remote annunciators

The GPIB/Remote annunciators are shown as the letters `KRLTS`. Each letter is shown if the state is true and is not shown if the state is false, as follows:

K	Keylock indicator	This is shown when the instrument is in the Keylock state (turned on and off by the `SYST:KLOCk` command)
R	Remote annunciator	Shown when the instrument is in the remote state, as when being controlled via the IEEE-488 bus (GPIB) or TCP/IP connections
L	GPIB Listen annunciator	Shown when addressed to listen via GPIB orTCP/IP
T	GPIB Talk annunciator	Shown when addressed to talk via GPIB or TCP/IP
S	GPIB SRQ annunciator	Shown when the instrument is asserting SRQ on GPIB. This annunciator is an amber color

Single/Continuous symbol/control

This annunciator shows as an arrow on an oval line when in Continuous, or an arrow on a straight line when in Single.

LXI indicator

This indicator displays in green when LAN is connected, in white when LAN is not connected, and in red when LAN is connected but has a connection problem.

PASS/FAIL indicator

This annunciator displays when Limits are turned on. It is green if all Limits are passing, and a red FAIL if any limit is not passing.

The following command queries the status of the current measurement limit testing. It returns a 0 if the measured results pass when compared with the current limits. It returns a 1 if the measured results fail any limit tests.

Remote Command	`:CALCulate:CLIMits:FAIL?`
Example	`:CALC:CLIM:FAIL?` queries the current measurement to see if it fails the defined limits Returns a 0 or 1: 0 it passes, 1 it fails

Trace Detector Settings Panel

In the Swept SA and some other measurements, there is a special panel summarizing the settings for the traces in the measurement:

There is one column for each trace. The rows are as follows:

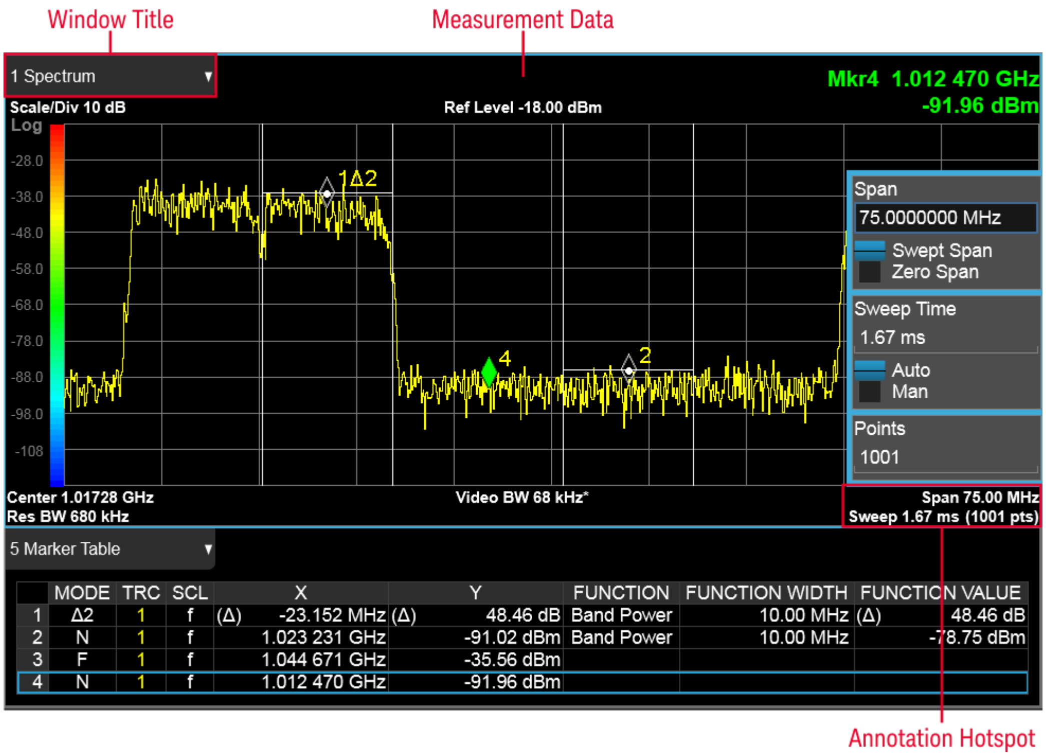
- The top row shows the Trace Number, in the trace color.
- The second row shows the Trace Type for each trace (W=Clear/Write, A=Trace Average, M=Max Hold, m=Min Hold); this letter is in white if the trace is Active, in gray if the trace is inactive; there is a bar through the letter if the trace is not being displayed
- The third row shows the detector for each trace (N=Normal, S=Sample, A=Average, P=peak, p=negative peak, Q=Quasi Peak, E=EMI Average, R=RMS Average, f=math function)

In the example above, trace 1 is active, visible, and in Average using the Sample detector, the other traces are inactive, blanked and in Clear/Write using the Normal detector.

Tapping this panel drops down controls for the Traces.

2.3 Measurement Display

The Measurement Display contains one or more data windows displaying the result of the current measurement. These may be graphical or textual windows.



Each window in the Measurement display contains a "Window Title" on page 109, "Measurement Data" on page 113, and graphical windows also may contain "Annotation Hotspot" on page 116.

The selected window in the Measurement Display is indicated by a blue border. Window-dependent controls in the menu panel always refer to the selected window.

2.3.1 Window Title

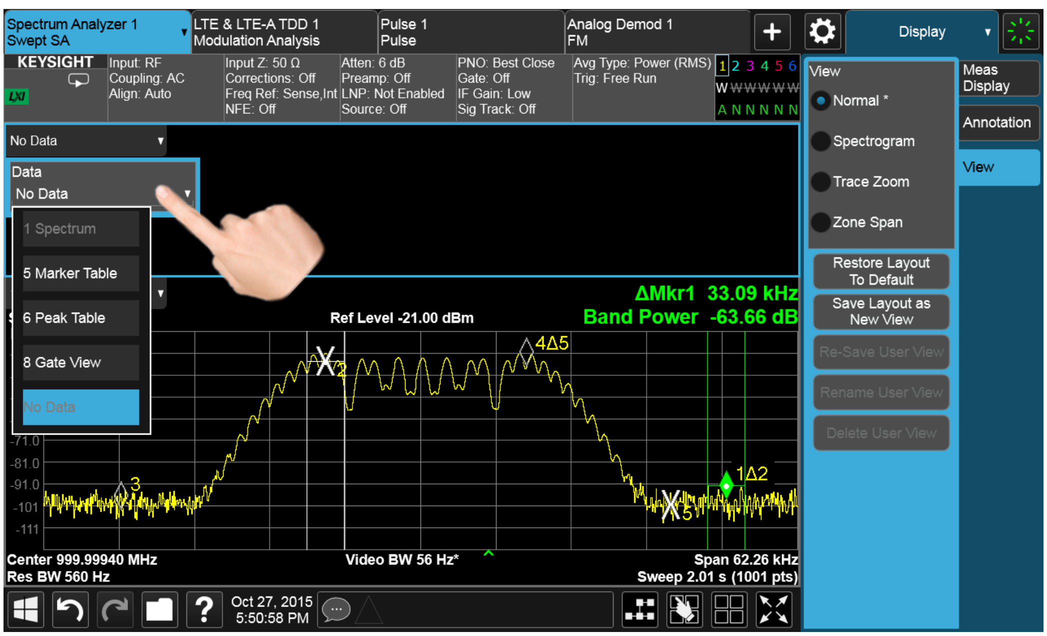
The Window Title appears in the upper left hand corner of the window, and includes a title describing the measurement data currently being displayed in the window. The title may also contain additional information about the data in the window, for example in the LTE measurement supplication, the component carrier being displayed in the window will be indicated (e.g., “CC0”).

Measurements that support User Views (see "View Editor" on page 153) also display the Window Number in the Window Title, to enable window addressing from SCPI. The number is the number that will be used in the SCPI command to address that window, for example, in the WCDMA Mod Accuracy measurement, Code Domain Power is assigned window number 6, so you address it with the following SCPI command:

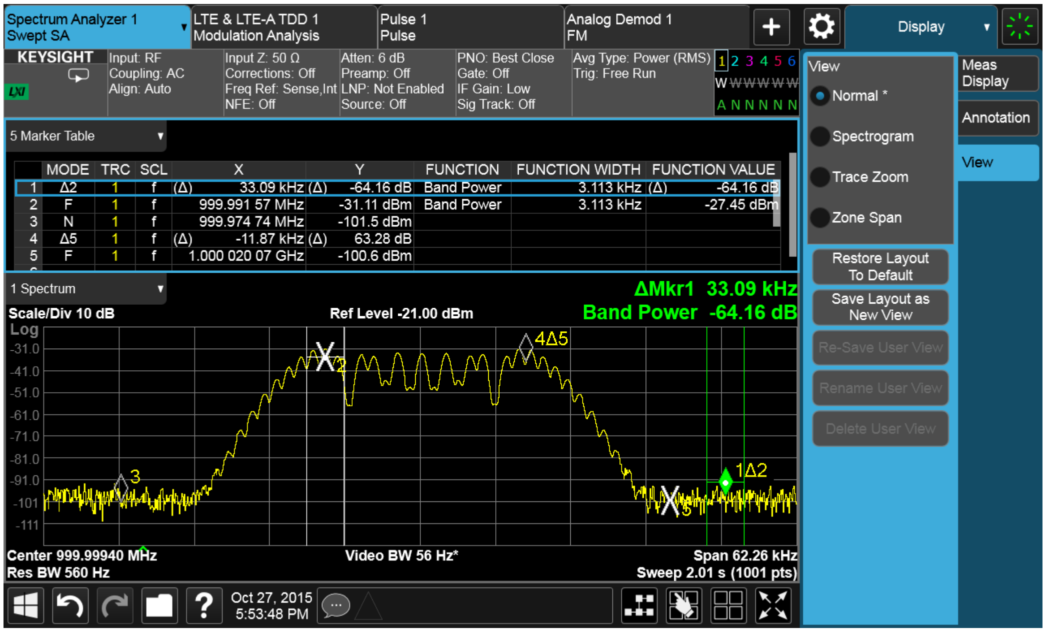
```
:DISP:RHO:WIND6:TRAC:Y:RLEV 0.0
```

Note the arrow pointing down on the right side of the Window Title. This indicates that touching the Window Title will display a dropdown, which enables you to select the Measurement Data to be displayed in the window.

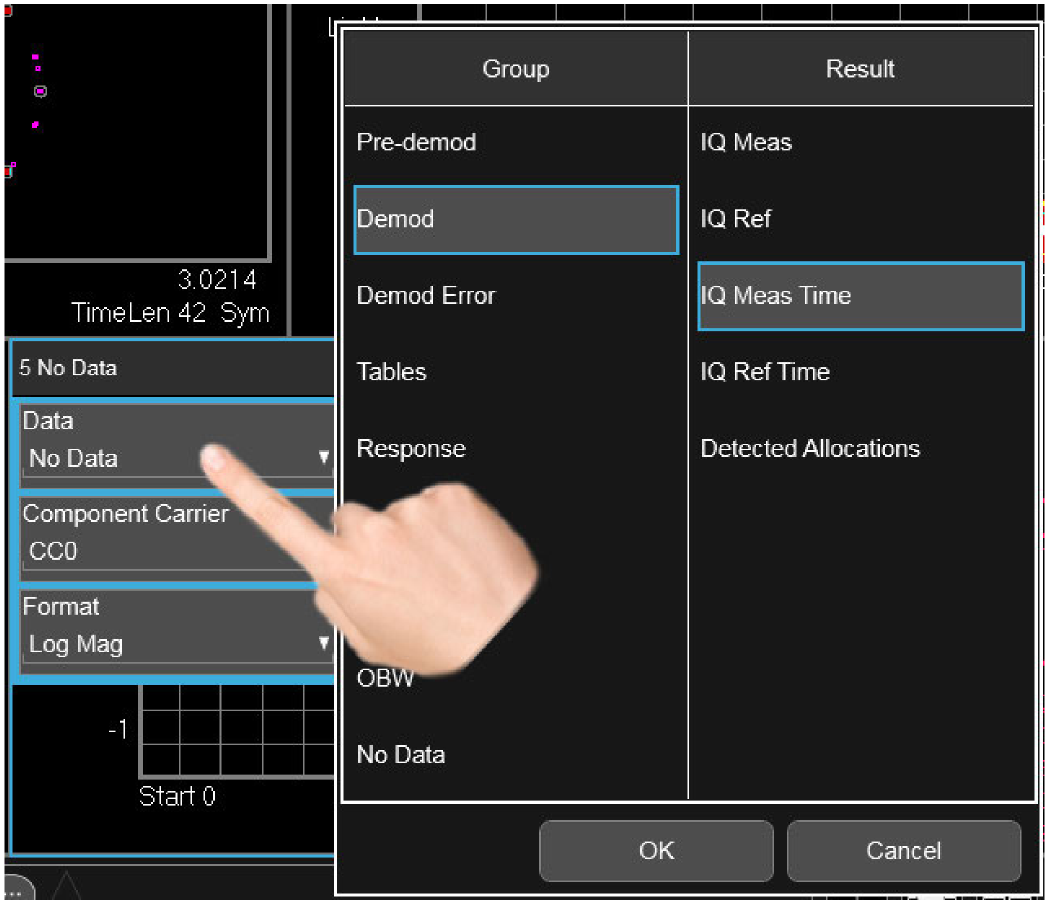
For example, if we wish to assign the results of the upper window in the display below to the Marker Table, we would touch the window title and then the “Data” control that is revealed, as shown:



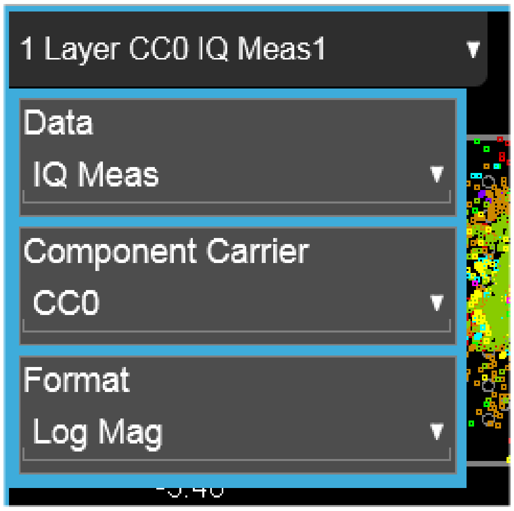
And then select Marker Table, yielding the result below:



Note also that the Window Data dropdown can be a cascaded list, if the number of available results requires categorization to hold them all:



Note also that the Window Data dropdown sometimes includes controls for further configuring the window, for example, in LTE choosing the desired Component Carrier and Data format.



Touching a window's title dropdown also selects the window.

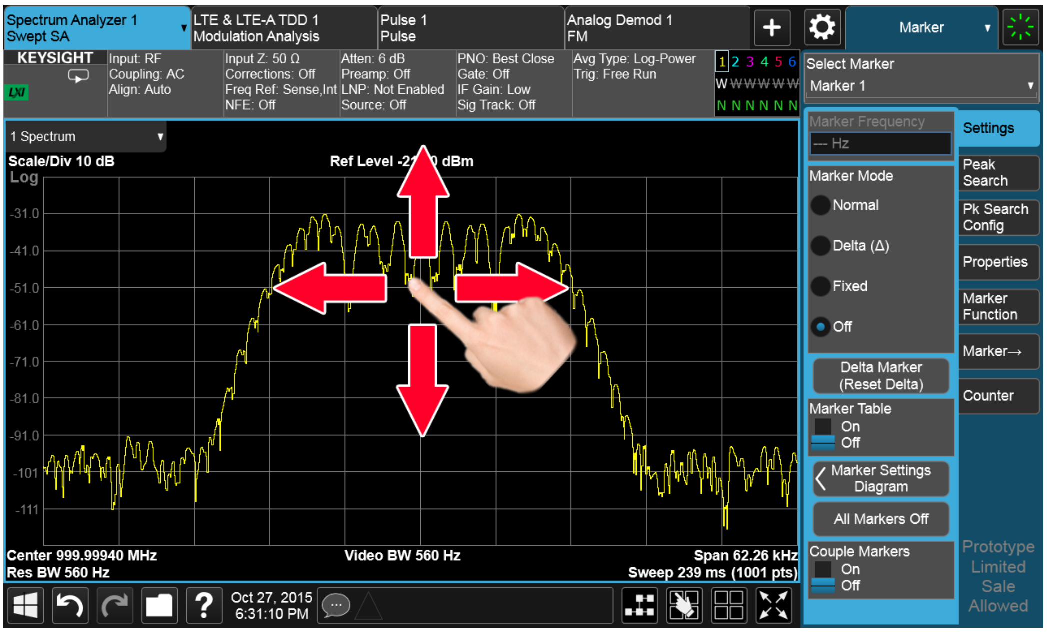
2.3.2 Measurement Data

The Measurement Data region shows graphical or textual data for the Data selected in the Window Title Data control. Below you can see examples of both graphical and textual windows in a four-window display.

There are many gestures which you can use to interact with a measurement display window. They are detailed below.

Swipe

There are several swipe actions, as listed below. One of the most important actions is swiping a spectrum window to the left or right, or up or down, to adjust the frequency and level of the spectrum, as shown below.



Swipe actions are summarized in the table below. Not all of these may be available, depending on the measurement.

Object	Action
Spectrum Trace Left/Right	Drag trace (change Center Frequency)
Spectrum Trace up/down	Drag trace (change Ref Level)
Marker Left/Right	Drag marker along trace
Fixed Marker Left/Right/Up/Down	Drag marker in space
Scrollable area	Scroll vertically or horizontally. Scrollable areas include the Menu Panel (if overfull), tables and lists. A scrollable area is indicated by a vertical or horizontal translucent white bar which can also be dragged by a mouse When scrolling a table: – Row headers remain in place when the table is scrolled horizontally, and scroll with the table when the table is scrolled vertically – Column headers remain in place when the table is scrolled vertically, and scroll with the table when the table is scrolled horizontally

Object	Action
Toggle control	Toggle in that direction

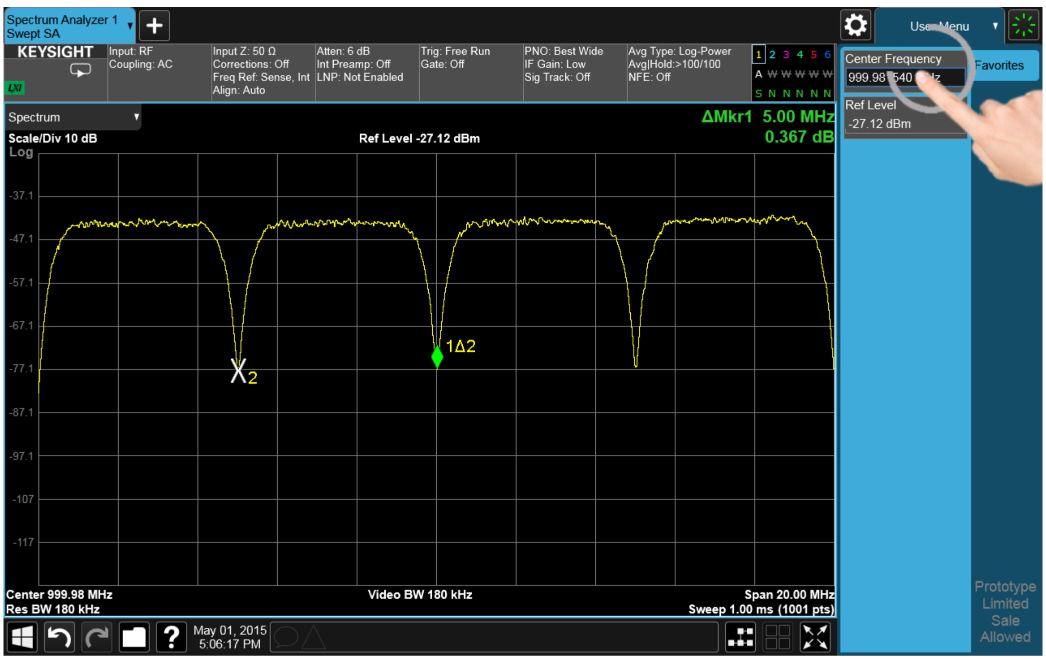
Pinch

You can also pinch in or out either horizontally or vertically to zoom in the x-axis or y-axis dimension. For example, a pinch horizontally lets you adjust the Span of the Spectrum window. Also, pinching on the wings of a Band Power or other Band Function allows you to widen or narrow that Band Function.

Pinching may sometimes be easier if you use the index finger of each hand, rather than pinching with one hand.

Touch-and-Hold

You can also touch-and-hold the display, that is, touch it and hold your finger on the display. A circle is drawn, and when the drawing completes, a right-click gesture is performed that depends on the screen feature touched, as listed in the table below.



Right Click on a Trace	Peak Search, Trace Type (Clear/Write, Trace Average, Max Hold, Min Hold), Trace View/Blank (Active, View, Blank, Background). Not all of these may be available, depending on the measurement
Right Click on a Marker	Marker Mode (Normal. Delta, Fixed, Off), Peak Search, Next Peak, Next Pk Right, Next Pk Left). Not all of these may be available, depending on the measurement

Right Click on the Background	Lets you select Help
Right Click on a Menu Panel control	Lets you add or remove that control from the User Menu or get Help on that control

Tap

Tapping an object causes the actions defined in the table below:

Object	Action
Marker	Select
Marker (repeated taps on stacked)	Cycle through stacked markers
Trace	Select. In addition if Marker is the active function, move the selected marker to the point where you tapped
Trace (repeated taps on stacked)	Cycle through stacked traces
Window	Select if unselected
Screen	Select if unselected

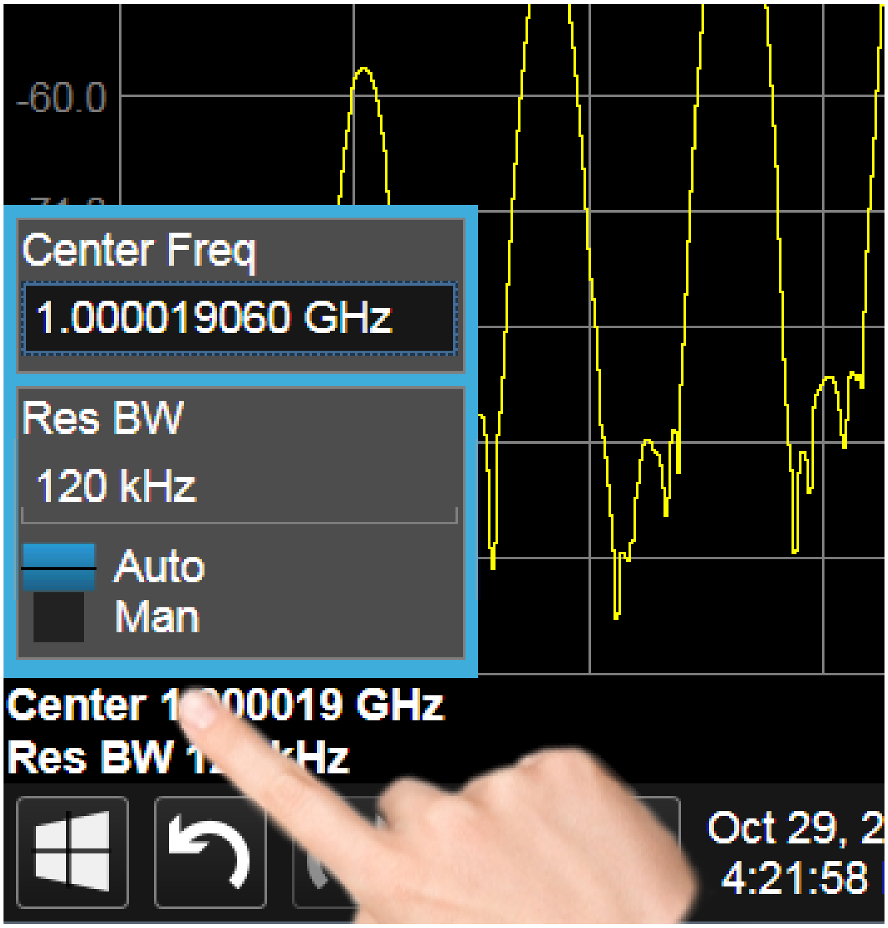
Double Tap

Double-tapping an object causes the actions defined in the table below:

Object	Action
Window	Zoom/Unzoom

2.3.3 Annotation Hotspot

You can tap on a graticule annotation to modify one of the fields in that annotation. For example if you tap on the region with Center Freq and Res BW in it, a menu panel pops up with just those settings on it.



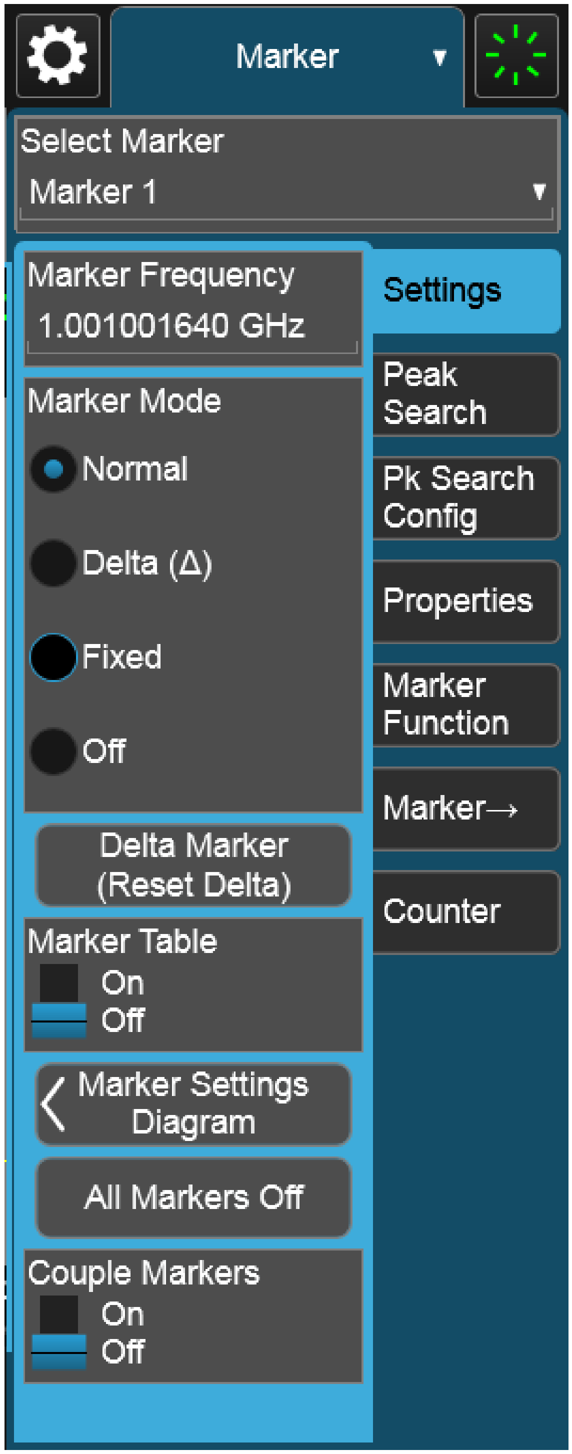
Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

Annotation which is not currently able to be adjusted is not grayed out on the display, but the control in the hotspot that drops down or pops up is grayed out.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function

2.4 Menu Panel

The menu panel is the main focus of the X-Series Multitouch user interface. The controls include active functions, dropdowns, action buttons, radio buttons and toggles.



Marker
Select Marker
Marker 1

Off
Delta Marker (Reset Delta)
Marker Table
On
Off
Marker Settings Diagram
All Markers Off
Couple Markers
On
Off

The menu panel normally appears on the right side of the display and consists of a rectangular panel with multiple “sub-panels” lying on top of each other, each sub-panel being accessed by a tab on the right.

You press a front panel key (or “hardkey”) to access a particular menu. On the front panel there are twelve “measurement hardkeys” (the ones in the shaded region in the figures below) – these are the hardkeys that open up menus in the menu panel.

With a menu open, tap a tab to access the controls on its sub-panel. Whenever you press the front panel key associated with a menu, the default (top) tab is selected.

If the number of controls on a panel exceeds the height of the panel, scrolling is enabled, which is indicated by a white bar on the left that fades away after a few seconds. You swipe up or down with your finger to scroll the panel, or you can grab the white bar with a mouse.

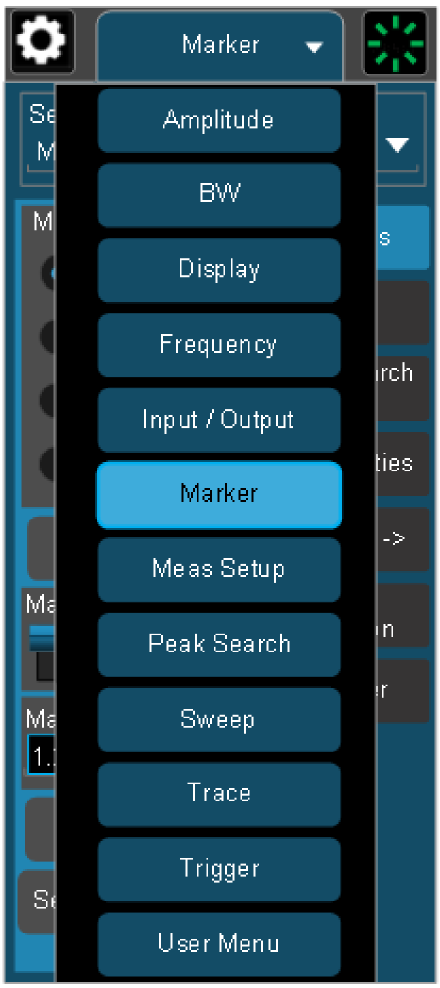
If you move to a different menu panel or sub-panel and then come back to a previous panel, the previous panel is always reset to be scrolled all the way back to the top.

Accessing Menus Without Using Front-Panel Keys

You can access the menu panels without using the front panel keys, as you would need to do if you were operating the instrument using Remote Desktop. Touch or click on the menu title, as shown below. A dropdown containing the twelve measurement hardkeys appears. Selecting a hardkey from the dropdown displays the corresponding menu, and the dropdown disappears.



Entering Numeric Values

Many controls on the menu panel allow you to enter numeric values. These are called “active functions.” An active function control displays a number and a suffix, for example 13.255 GHz, as in the example below:

An active function is “active” if the numeric value is surrounded by a black background with a blue border, as below. In this state, it is ready to receive numeric input from the number pad on the front panel, the knob, or the step keys.

When an active function is in the active state, you can start typing or pressing the number keys on the front panel, which causes the Numeric Entry Panel to appear, as shown below. The Numeric Entry Panel displays the typed value, and the terminators to complete the entry.

Here we see a UXA with an active function control in the active state. Although no Numeric Entry Panel is displayed, you can just touch the “2” key:

This causes the Numeric Entry Panel to pop up to receive the numbers you are typing:

Type in as many digits as required, then touch one of the unit terminator buttons in the Numeric Entry Panel to complete the entry. In this case, 2 GHz was the desired entry, so you just touch the “GHz” terminator:

The Numeric Entry Panel disappears and, in the example, the active function value becomes 2 GHz.

It is important to note that you can always pop up the Numeric Entry Panel by touching an active function control while it is active; for example, if you were to touch it in the figure above, the Numeric Entry Panel would pop up right next to the control:

UXA
Frequency

You can display the Numeric Entry Panel by touching any active function control while it is active, but you don't have to pop up the Numeric Entry Panel first, you can just start typing and it will pop up on its own, thus saving you a keystroke.

You can also adjust a value without displaying the Numeric Entry panel by turning the knob or using the step keys while an active function is active. If you turn the knob or use the step keys while the Numeric Entry Panel is displayed, it disappears, allowing you to see the entire screen while you are making the adjustment.

You can also drag the Numeric Entry Panel to another part of the display if it is covering something that you wish to see while it is on the screen.

2.4.1 Right-Click Menu

If you click with the right mouse button on any of the menus in measurements, a popup menu appears, which includes:

The items in this menu are:

- "Add to User Menu" on page 128
- "Help on this setting" on page 128
- "Show SCPI Command" on page 128
- "Add to SCPI Recorder" on page 129
- "Start/Stop SCPI Recorder" on page 129
- "Show SCPI Recorder" on page 129

2.4.1.1 Add to User Menu

For details, see "User Menu" on page 129.

2.4.1.2 Help on this setting

For details, see "Help" on page 142.

2.4.1.3 Show SCPI Command

Enabled/visible when the currently-active feature has an associated SCPI command or query. Displays a popup dialog that shows the active GUI selection's SCPI command.

To close the popup dialog, click **OK**

2.4.1.4 Add to SCPI Recorder

Adds SCPI to the recorder from User Interface features that have equivalent SCPI.

This is the manual mode for adding SCPI to the recorder when you do not wish to add SCPI continuously. This control is enabled only when the current active feature has an associated SCPI command or query.

Irrespective of the continuous recording state, clicking this control adds the active entry into the recorder, including the active value if it is a setting.

2.4.1.5 Start/Stop SCPI Recorder

Starts or stops continuous recording mode. After starting the recording, any changes to settings will be recorded.

After continuous recording is enabled, the button label changes to **Stop SCPI Recorder**, which is displayed while recording is in progress. Clicking **Stop SCPI Recorder** halts recording and switches the control label back to **Start SCPI Recorder**.

2.4.1.6 Show SCPI Recorder

This shortcut opens the dialog "SCPI Recorder" on page 2172.

2.4.2 User Menu

Lets you create your own menu, to include controls that you frequently use. You can have one **User Menu** for each measurement, and all User Menus survive a power cycle.

You add a control to the User Menu for the current measurement by right-clicking on the control, then selecting "Add to User Menu" on page 128. You can also remove the control from the User Menu using the same right-click menu item.

User Menu appears at the bottom of the menu drop-down panel.

2.5 Cancel key

Local

This front-panel key has the same functions as the Windows **Esc** (Escape) key. It does the following:

- Cancels dialogs
- Cancels active functions (unless there is an entry in progress, in which case it cancels that, and reverts to the previous value)
- Resets input overloads
- Aborts print operations
- Cancels certain other operations (such as alignments)
- Returns you to Local Control (if in Remote)
- If the backlight is off, turns on the backlight, and does nothing else

Most of this functionality is the same as earlier X-Series models and similar to ESA and PSA operation.

When the instrument is in Remote, any hardkey that is pressed on the front panel displays this message:

`Analyzer is in Remote. Press ESC to return to Local`

The exception is the **Cancel (ESC)** key, which takes the instrument out of Remote.

When the instrument is also in the LLO (local lockout state), the **Local** key is locked out as well. When this is the case, and the **Local** key is pressed, this message is displayed:

`Local key is locked out by remote computer. Cancel Local Lockout on computer or release remote control`

When you see this message, you should disconnect the remote computer, or use it to take the instrument out of the Local Lockout state.

2.6 Onscreen Keyboard key

This key turns the onscreen alpha keyboard (OSK) on and off.

There are two onscreen keyboards:

- The Multitouch OSK, which pops up automatically if, while using the analyzer application, a text field becomes the active function
- The Windows OSK, which you must open manually when a text field must be entered while interacting with Windows or other apps

2.7 Touch On/Off Key

This front-panel key turns the display touch functionality on and off. If off, you can turn it back on using the front panel **Touch On/Off** key. When the touch functionality is off, you can still use a mouse as a pointer.

When toggled, a dialog box appears midscreen that confirms “Touchscreen On” or “Touchscreen Off”.

This function remains in effect until it is turned off or until the app shuts down. The app always starts up with Touch enabled.

2.8 Tab key

This key has the same function as the **Tab** key on a PC keyboard.

You can use this key to display the Windows Taskbar, as follows.

– Alt-Tab to the Desktop

– Touch the desktop

– Touch **TAB**

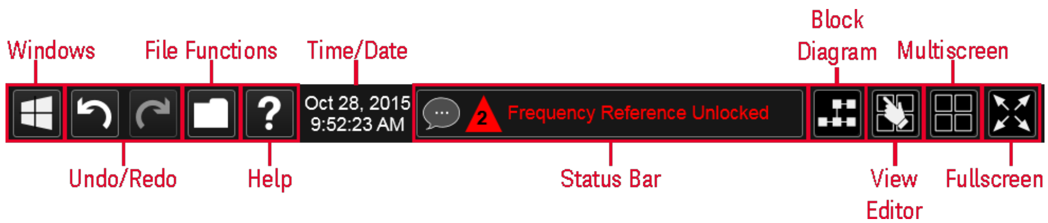
– The Taskbar appears

2.9 Local Button

Appears in the Menu Panel when the instrument is in remote, and can be brought back to local via the **Local (ESC)** Key. See also "Cancel key" on page 130.

2.10 Control Bar

The Control Bar contains controls and readouts that let you control instrument functions independent of the current measurement.



2.11 Windows

Pressing the Windows icon on the "Control Bar" on page 135 has the same effect as pressing the Windows icon on the Windows taskbar. It displays the Windows taskbar and Start Menu, which allows you to launch Windows programs and access features such as the Control Panel.

2.12 Undo/Redo

The Undo button in the "Control Bar" on page 135,

and the Undo front panel key,

are used to undo the most recently executed function.

If you Undo a function, and then decide you should not have done so, you can use the **Redo** button in the "Control Bar" on page 135 to put it back the way it was. The Redo function may also be executed by pressing **Ctrl+Undo** (holding the **Ctrl** key down while pressing the **Undo** font panel key).

Undo allows you to restore a setting, which you had previously set, back to its value before you changed it. When you press the Undo button or front panel key, the last setting you changed is "undone", that is, its previous setting is restored. You are notified of this fact with an advisory pop up message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would show:

```
UNDO: Center Freq 1 GHz -> 300 MHz
```

The instrument can store 5 levels of action for Undo.

To truly understand Undo and Redo, it helps to think of two "stacks", an Undo stack and a Redo stack,

UNDO stack	REDO stack

Whenever you perform an action, it is placed on the Undo stack. So for example, if you set the Center Frequency to 1 GHz, then set the RBW to 1 MHz, then set the Detector to Peak, each of these actions gets "pushed" onto the Undo stack:

UNDO stack	REDO stack
Det = Peak	
RBW = 1MHz	
CF = 1 GHz	

When you press **Undo**, the top item on the Undo stack is removed, the action represented by that item is undone, and the item is placed on the Redo stack. So pressing **Undo** once in the above case would undo the setting of the peak detector, and the stacks would look like this:

UNDO stack	REDO stack
RBW = 1MHz	Det = Peak
CF = 1 GHz	

Now pressing **Undo** again would undo the RBW = 1 MHz action, and the stacks would look like this:

UNDO stack	REDO stack
CF = 1 GHz	RBW = 1MHz
	Det = Peak

Now pressing Redo would Redo the RBW = 1 MHz action, and the stacks would again look like this:

UNDO stack	REDO stack
RBW = 1MHz	Det = Peak
CF = 1 GHz	

Also, whenever you set a value, the Redo stack is cleared; you can't redo an action once you have interrupted the original flow of actions. Think of the Undo stack as the past, and the Redo stack as the future; if you have items in both stacks it means you have gone back to a time in the past; if you then *do* something you have changed the future, so the old future (the Redo stack) gets cleared.

For example, in the example above, if you now were to change another setting, such as VBW = 1 kHz, the Redo stack gets cleared, and the stacks would look like this:

UNDO stack	REDO stack
VBW = 1 kHz	
RBW = 1MHz	
CF = 1 GHz	

Undo can undo changes you make with the knob or step keys, however all contiguous events that affect the same parameter are aggregated into one event for the sake of Undo. For example, if CF is the active function and is 1 GHz, and you turn the knob back and forth, then enter a value, then use the step keys, when you press **Undo**, the instrument returns to CF = 1 GHz.

Actions that Cannot be Undone

There are some actions that cannot be undone, because these clear the Undo/Redo stack:

- Restore Mode Defaults clears the stack for that Mode in that Screen
- Sending SCPI commands clears the stack for that Mode in that Screen
- Loading a state file (including User Preset) clears the stack for that Mode in that Screen
- Deleting a Screen clears all the stacks in that screen
- Changing Views

Undo/Redo works within the context of a Mode. Each Mode in each Screen keeps its own record. Settings in the Control Panel or System Settings menus are not undoable.

There are several actions that may change many parameters. Among these are Auto Tune, and Adjust Atten for Min Clipping. After executing such a function, Undo sets all parameters back to their value before the function was selected. Auto Tune appears to be a single action, even though the instrument executes it in several steps.

Redo reverses the effect of the last Undo action, assuming that no other settings have been changed since the last Undo. Changing a setting after an Undo clears memory of all settings after that Undo, that is, it clears the Redo stack, as explained above.

When you press the **Redo** icon or **Ctl** and the **Undo** hardkey, you are notified with an advisory popup message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would say:

```
UNDO: Center Freq 1 GHz -> 300 MHz
```

If you then press **Redo**, the message will say:

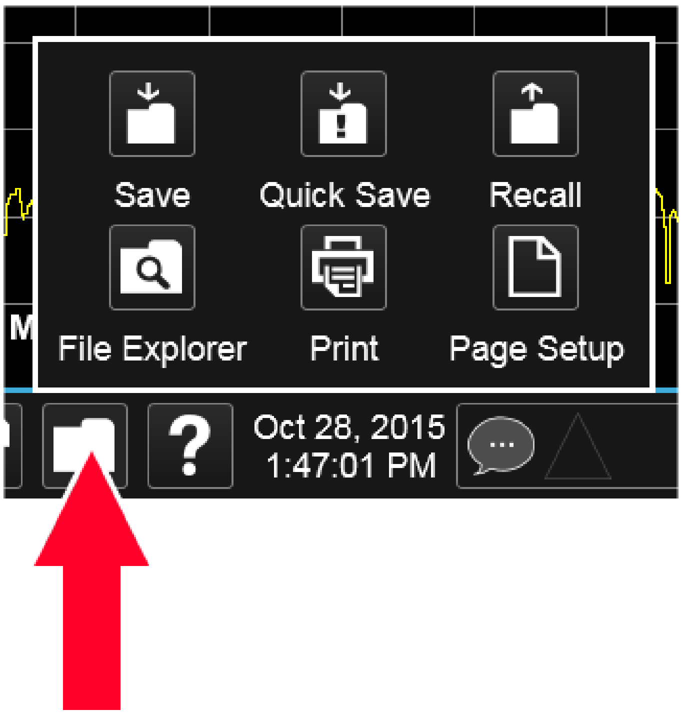
```
REDO: Center Freq 300 MHz -> 1 GHz
```

Neither **Undo** nor **Redo** perform any navigation, and have no effect on which menu panel is displayed nor which function is active.

2.13 File Functions

The File Functions popup contains controls for executing Save, Recall, File and Print operations. You display the File Functions popup by tapping the File Functions icon in the "Control Bar" on page 135.

For more information on a control, tap an icon in the image below.



Tapping this folder icon displays the File Functions popup

2.13.1 File Explorer

Pressing the File Explorer button in the "File Functions" on page 141 dialog opens the Windows File Explorer, which allows you to perform operating system file functions such as Move, Copy and Delete.

File Explorer also allows you to map network drives to drive letters on your PC or intranet, in order to more easily save screen images, states and other data, and load them back into the instrument.

2.14 Help

Pressing the **Help** button in the "Control Bar" on page 135, the **Help** front panel key, or the **F1** key if you have a PC keyboard connected, opens the context-sensitive help system. The **Help** button appears in the "Control Bar" on page 135 and in the banner of full-screen dialogs

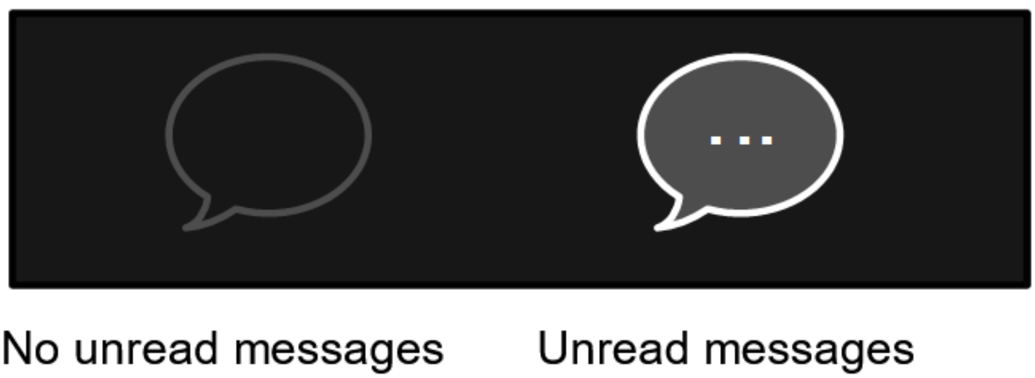
You can also use the Help window's Contents pane to navigate to Help for any function in the instrument

You can also touch-and-hold a specific control to display a "right-click" menu, in which one of the choices is **Help on this setting**

2.15 Status Bar

The Status Panel (or Status Bar) appears at the bottom of the display and contains three fields:

The Message Balloon appears on the left side of the Status Panel and lets you know when there is an unread message in the queue.



The Message Balloon has a gray outline and no fill if there are no unread messages; it has a gray fill and a white outline and displays a white ellipsis in the middle if there are unread messages.

The Condition Indicator appears to the right of the Message Balloon and shows the current number of open conditions. Below are some examples of what the Condition Indicator can look like:

The triangle is unfilled if no there are no open conditions, filled with yellow if all open conditions are warnings, and filled with red if at least one open condition is an error. The number displayed is the total number of open conditions.

Touching the Condition Indicator opens up the Show Status dialog (see below) with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.

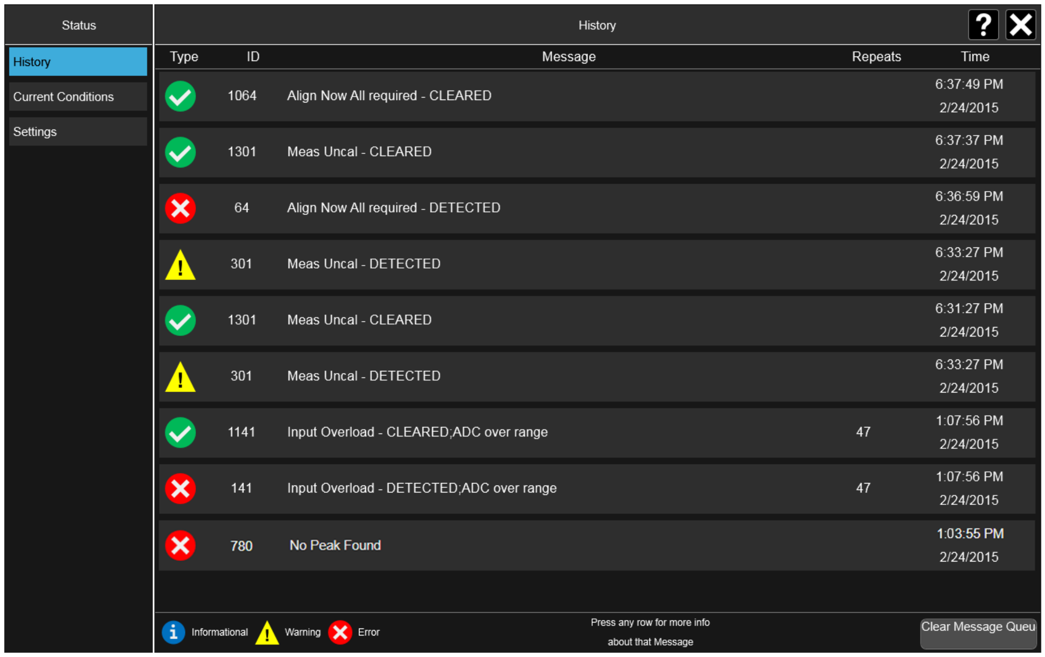
The Condition Message appears to the right of the Condition Indicator. In the example below, the cCondition Message is “Align All, Now required”:

Warning condition messages display in yellow, error condition messages display in red.

If there is more than 1 open condition, the Condition Message cycles through the display of all of the open conditions, one at a time. Each message is displayed for 2 seconds, then the next for 2 seconds, and so on.

Show Status Dialog

The Show Status dialog appears if you tap anywhere in the Status Bar. Touching the Condition Indicator (the triangle in the Status Bar) opens up the Show Status dialog with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.



If the display fills up, scrolling is enabled just as in other X-Series Multi-touch UI displays.

The Status dialog automatically refreshes as new messages and conditions occur.

At the bottom of the screen is a Clear Message Queue button. This button clears all errors in all error queues.

Note the following:

– Clear Message Queue does not affect the current status conditions

– Mode Preset does not clear the message queue

– Restore System Defaults (Super Preset) will clear all message queues

– *CLS only clears the queue if it is sent remotely and *RST does not affect any error queue

– Switching Modes does not affect any error queues

See "More Information" on page 146

Remote Command	`:SYSTem:ERRor[:NEXT]?`
Example	`:SYST:ERR?`
Notes	The return string has the format:

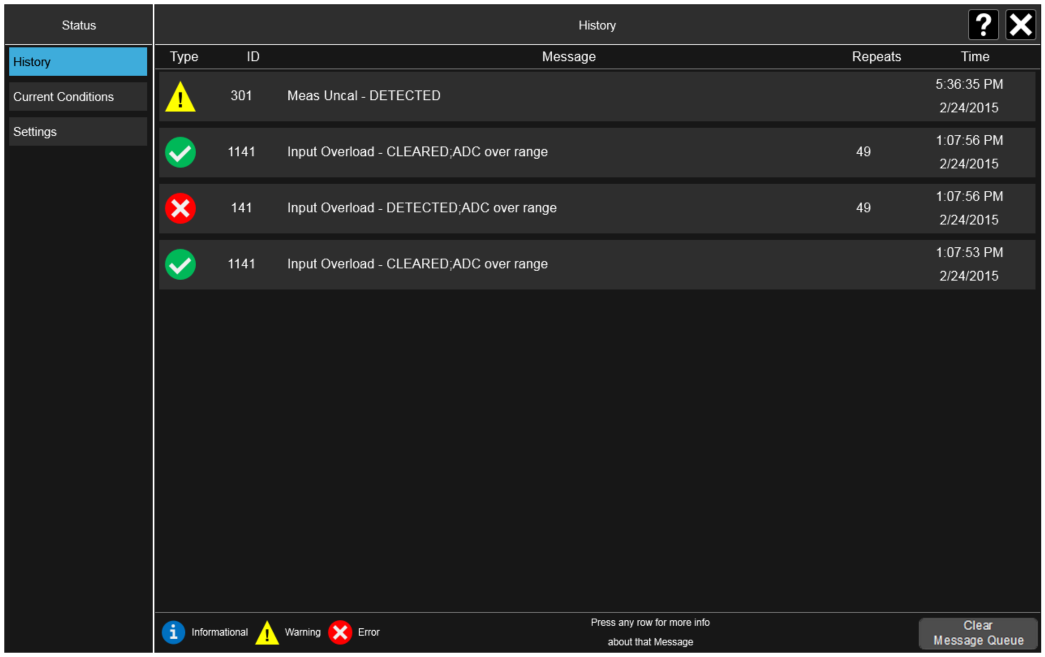
	`<Error Number>,<Error>` Where `<Error Number>` and `<Error>` are those shown on the Show Errors screen
Backwards Compatibility Notes	In some legacy analyzers, the Repeat field shows the number of times the message has repeated since the last time the error queue was cleared. In the X-Series, the Repeat field shows the number of times the error has repeated since the last intervening error. So the count may very well be different than in the past even for identical signal conditions Unlike previous analyzers, in the X-Series all errors are reported through the Message or Status lines and are logged to the event queue. They never appear as text in the graticule area (as they sometimes do in previous analyzers) and they are never displayed in the settings panel at the top of the screen (as they sometimes do, by changing color, in previous analyzers) As a consequence of the above, the user can only see one status condition (the most recently generated) without looking at the queue. In the past, at least in the Spectrum Analyzer, multiple status conditions might display on the right side of the graticule In general, there is no backwards compatibility specified or guaranteed between the error numbers in the X-Series and those of earlier products. Error, event, and status processing code in customers' software will probably need to be rewritten to work with X-Series In the legacy analyzers, some conditions report as errors and others simply turn on status bits. Conditions that report as errors often report over and over as long as the condition exists. In the X-series, all conditions report as start and stop events. Consequently, software that repeatedly queries for a condition error until it stops reporting will have to be rewritten for the X-series

More Information

The Status Dialog has two screens, selectable by the tabs on the right: **History** and **Current Conditions**:

History

History brings up a screen displaying the front panel message queue in chronological order, with the newest event at the top. Remember that the front panel queue contains all of the events generated by front panel actions as well as error events from all of the SCPI queues. A typical History display appears below:



The fields on the History display are:

Type	Displays the icon identifying the event or condition as an error or warning
ID	Displays the error number
Message	Displays the message text
Repeat (RPT)	This field shows the number of consecutive instances of the event, uninterrupted by other events. In other words, if an event occurs 5 times with no other intervening event, the value of repeat will be 5 If the value of Repeat is 1 the field does not display. If the value of Repeat is >1, the time and date shown are those of the most recent occurrence. If the value of repeat reaches 999,999 it stops there. The Repeat field can run into some pretty large numbers when apps (like the GSM app) report things like “GSM sync burst not found” as events rather than conditions, which is actually fairly common Note that the repeat count is unavailable over SCPI
Time	Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second

To understand the History dialog, and to properly program the instrument’s messaging system, remember that there are two types of occurrences, events and conditions:

- An event is an occurrence of zero duration. Events generate messages which are displayed in the center of the display for a period of time and then fade away. These may be of an advisory nature or may represent errors, for example “No peak found”

- A condition is an occurrence of finite duration, that is, it has a start and an end. Conditions are states of the analyzer characterized by some combination of settings or some kind of failure that the user needs to be told about while it is happening, but then can stop being told once it goes away; for example “Input overload; ADC over range”

The error queue contains error events as well as the DETECTED and CLEARED events for condition errors, as seen in the figure above.

DETECTED events have numbers less than 1000 and CLEARED events have the same number plus 1000. For example,

301, Meas Uncal – DETECTED

and later

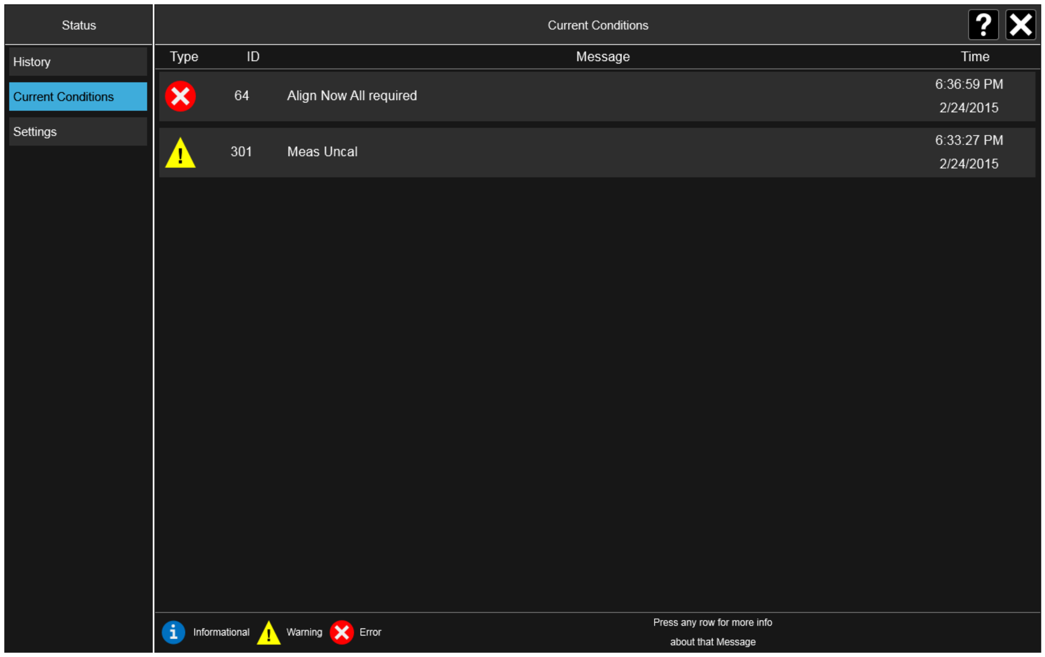
1301, Meas Uncal – CLEARED

To detect a condition error over SCPI, you should read the error queue and note any DETECTED error which is not followed eventually by an associated CLEARED error. This means the condition is still in effect. It is not sufficient to simply read the error queue until you get “No Errors” back. You may still have the condition error; the condition may still be in effect, and if that is the case, all you have done by clearing the error queue is to remove the first event (the DETECTED event) from the queue. For a condition error, you have to read the error queue until you see the CLEARED event for that condition. THEN you know that the condition is gone.

Current Conditions

The **Current Conditions** display shows all of the open conditions in the instrument. An open condition is a condition error or warning for which a start (detected) event has occurred but for which no corresponding stop (cleared) event has occurred.

An example of the Current Conditions screen appears below:



The fields on the Current Conditions display are:

Type	Displays the icon identifying the event or condition as an error or warning or informational
ID	Displays the error number
Message	Displays the message text
Time	Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second

Touching a condition message expands the display of that message. Touching again collapses it. The description is the same as the one that appears on the message dialog. An example of this is shown in the History section, below.

When there are no open conditions, the display is as shown below:

Show Status
Current Conditions
History
Current Conditions
Settings
Type
ID
Message
Time
No Conditions Present
Informational
Warning
Error
Press any row for more info about that message

2.16 Block Diagram

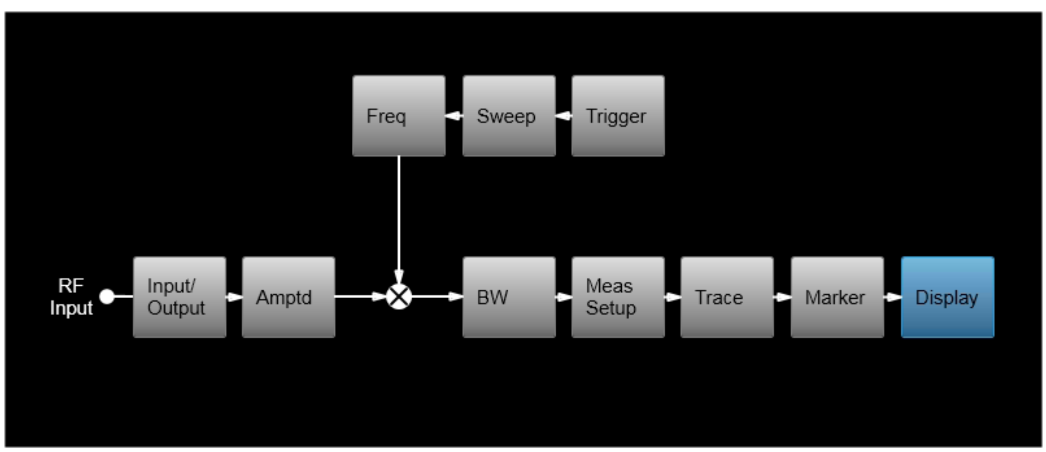
When you press the Block Diagram button in the "Control Bar" on page 135, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

When you press the Block Diagram button, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

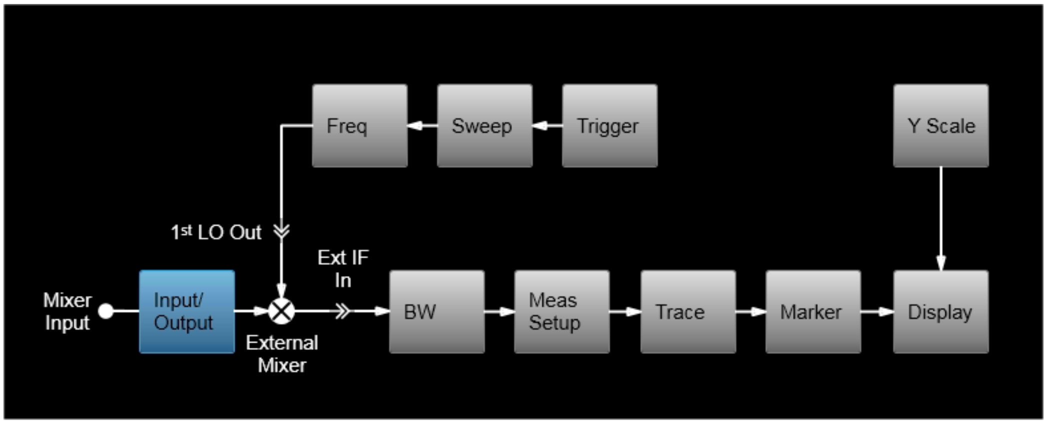
While in the Block Diagram display, the button is blue colored, as:

To exit the Block Diagram display, tap the button again.

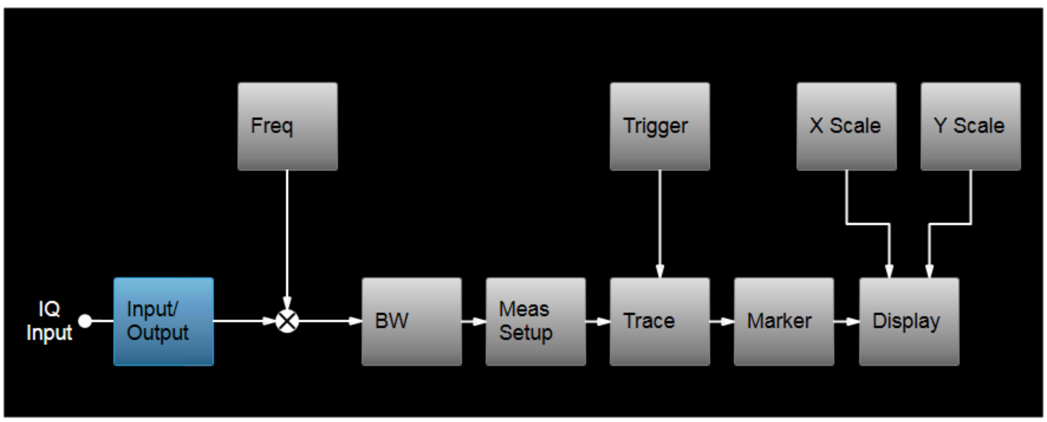
The Block Diagram display is not meant to be a completely accurate representation, but one which can show differences as you change the hardware setup. For example, here is the basic RF Block Diagram:



And here is the Block Diagram when External Mixing is selected:



And here is the Block Diagram when the I/Q inputs are selected:

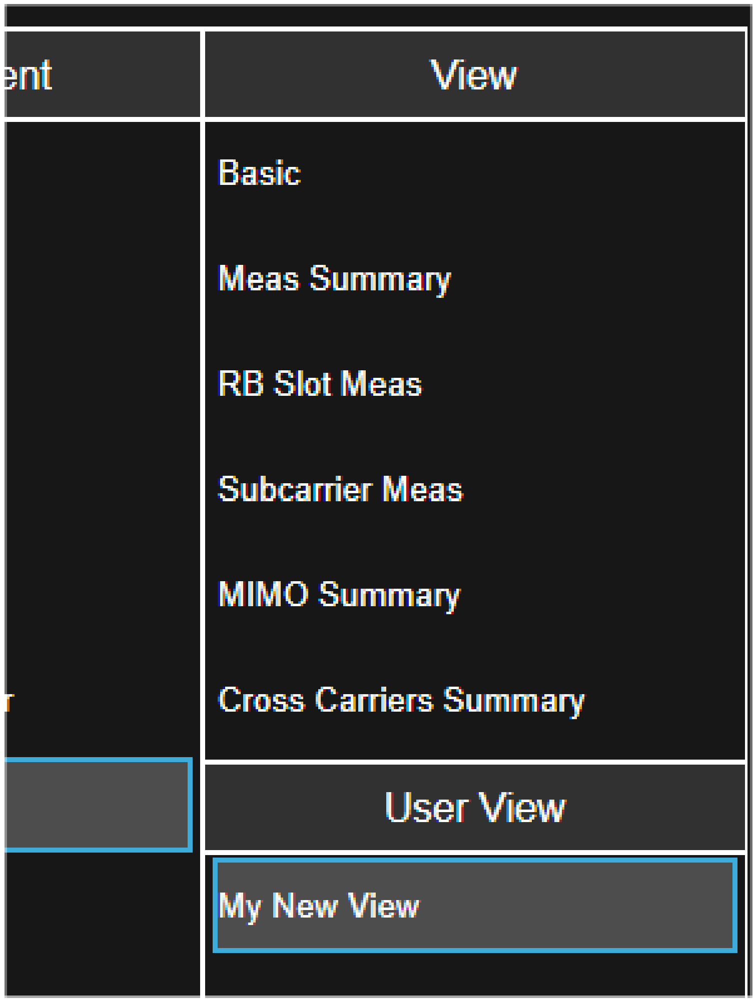


2.17 View Editor

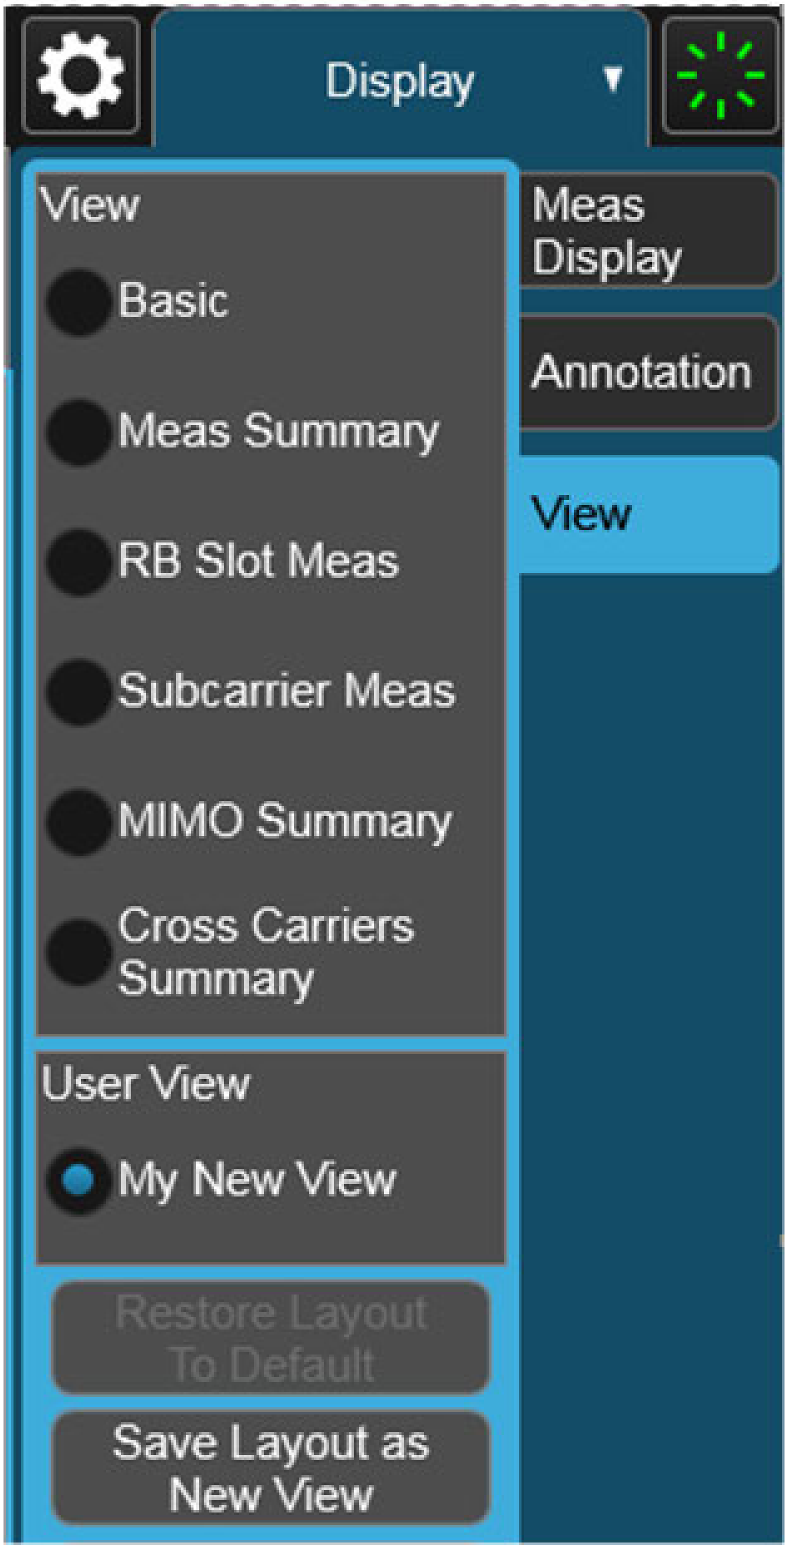
This section describes the use of the View Editor, which allows you to:

- Add windows to and delete windows from the current measurement
- Resize and rearrange windows
- Create User Views

User Views are custom Views that you create by adding, deleting, rearranging, resizing, or changing the contents of the windows in an existing View, and then saving the edited View as a new View. The instrument lists the current User Views for a measurement after the Predefined Views, in the Mode/Meas dialog and on the View menu panel under Display:



View
Basic
Meas Summary
RB Slot Meas
Subcarrier Meas
MIMO Summary
Cross Carriers Summary
User View
My New View



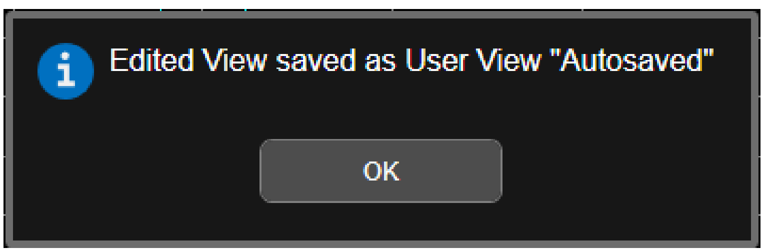
Display
View
Basic
Meas Summary
RB Slot Meas
Subcarrier Meas
MIMO Summary
Cross Carriers Summary
User View
My New View
Restore Layout To Default
Save Layout as New View
Meas Display
Annotation
View

You can save an edited View using the **Save Layout as New View** control in the View menu (see "To Save a User View" on page 166).

On occasion, the instrument may automatically save an edited View for you. If you have edited a View, so that the * is displaying next to the View name, you must save that View as a User View before you save State or switch measurements. If you forget that you have made changes to a View, then to keep from losing your edited View when you switch measurements, the instrument will save it for you. If you have an edited View that has not been saved and you try to do any of the following:

- Enter the “Save” menu
- Switch Measurements
- Switch Modes
- Switch Screens

the edited view will be saved for you with the name “Autosaved”. When this happens, you will receive the following message:



If an Autosaved User View already exists, the User View called “Autosaved” will be overwritten with the currently edited view. If you have multiple edited views, the selected edited view will be Autosaved. If there is not an edited view selected the last selected edited view will be Autosaved.

To Open the View Editor

Pressing the View Editor button (shown above) in the "Control Bar" on page 135, at the bottom right of the screen, opens the View Editor.

While in the View Editor, the icon is blue colored, as:

Pressing the View Editor button again exits the View Editor.

To Close the View Editor

Tap the View Editor button again.

The user chooses the desired View through the use of the Mode/Meas/View dialog (see "Mode/Meas/View Dialog" on page 86) or the View menu (a tab under the **Display** key). The View menu allows the user to browse the views in the current measurement. The View menu contains a list of Predefined Views for you to use. If you wish to modify a Predefined View or create your own, new View, you use the View Editor.

User Views & Predefined Views

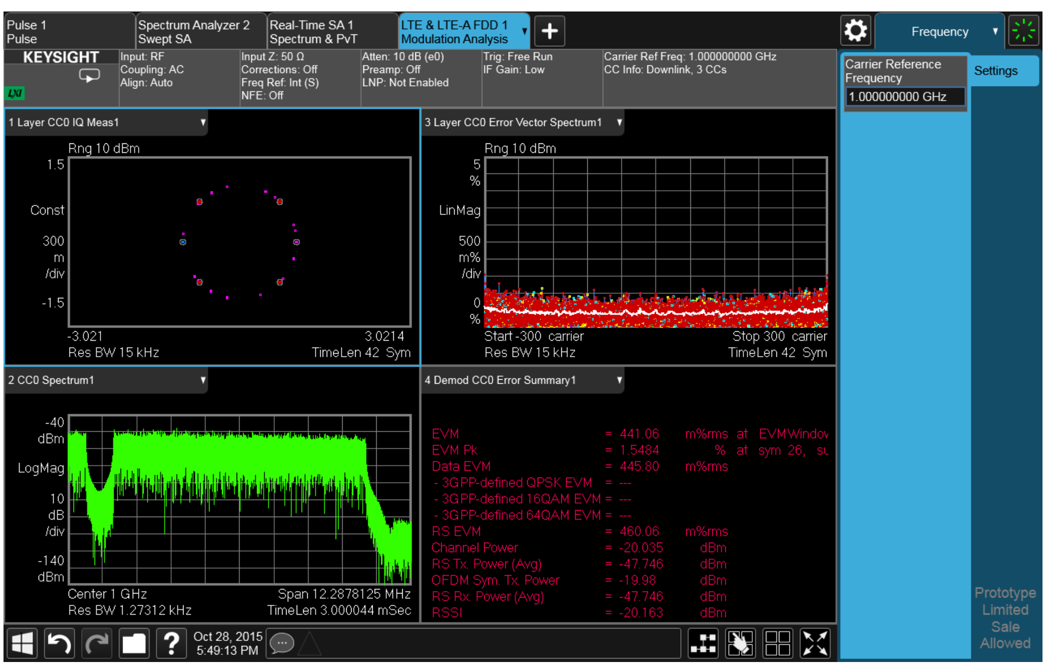
A User View is any View that is not in the list of predefined Views for the current measurement. For example, the Swept SA measurement has four predefined Views: Normal, Spectrogram, Zone Span, and Trace Zoom.

User Views allow you to add, delete, change and rearrange the windows of a predefined View, creating a new custom view.

2.17.1 To Create a User View

Whenever you add or delete a window to/from a predefined View, or change what is being displayed in a Predefined View's window, the Predefined View is marked with an asterisk (*), to show that it has been modified.

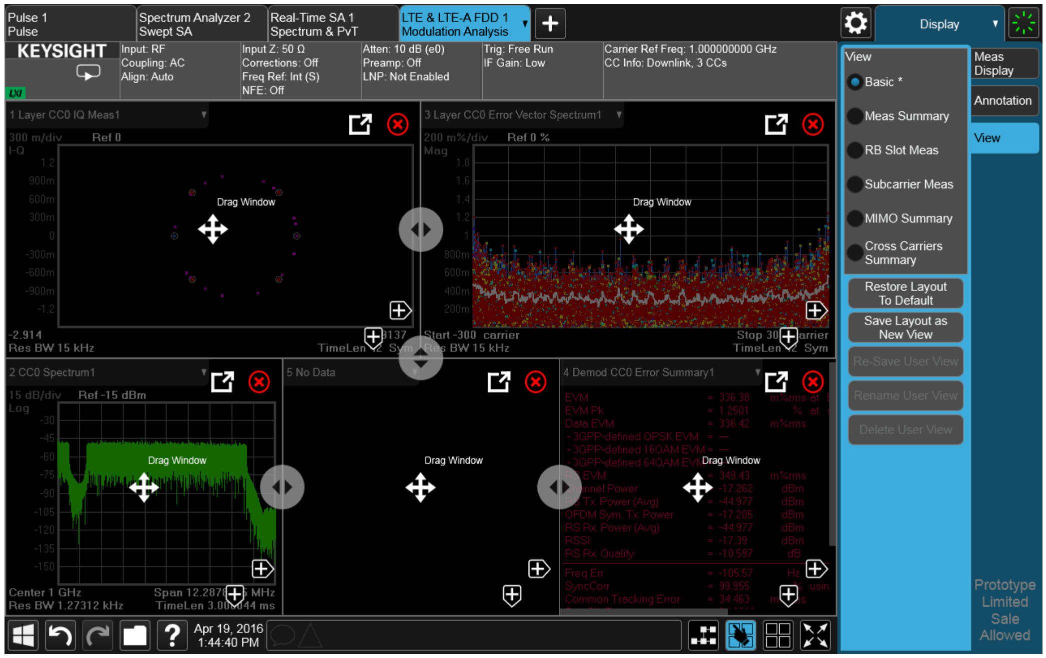
For example, to edit the View shown below, you press the Edit View icon.



When you do this, you get the View Editor screen, which appears as below. The menu panel switches to the View menu. Here we see that we are in the Predefined View called “Basic”.

Each window has two arrows containing + signs. Pressing either of the “+” symbols adds a new window on that side. For example, let’s say you press the + symbol on the right of the lower left window:

You would then see this:



A fifth window has been added, and is automatically assigned the number 5. (The window number, which is displayed in the Window Title region, is used when sending SCPI commands to that window).

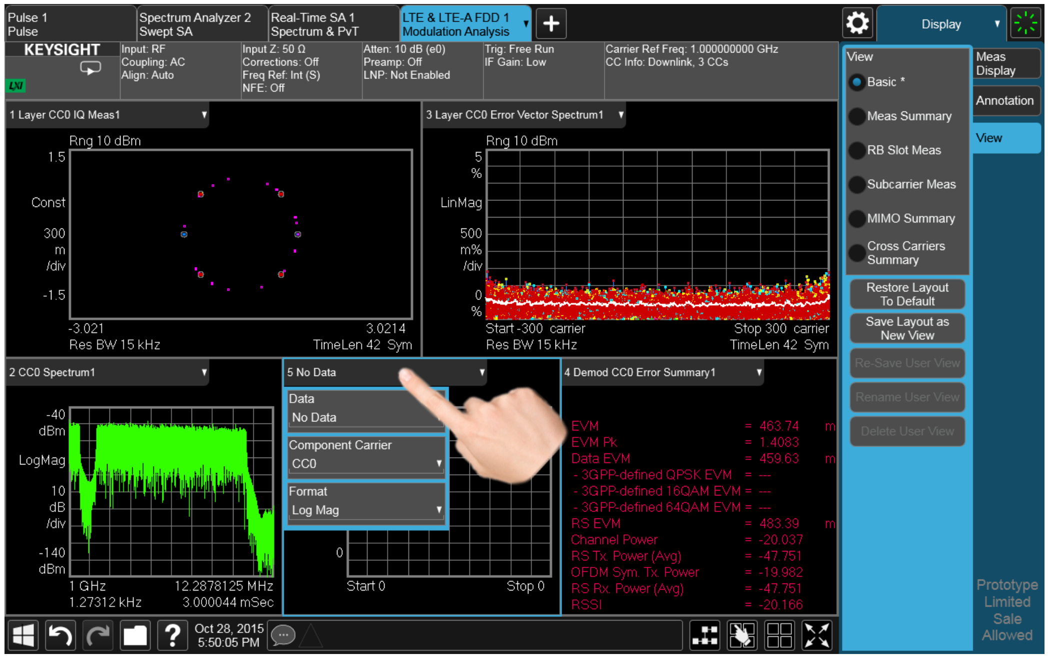
Note the * that now appears next to Basic in the View menu, indicating that you are now in the **modified** Basic View. You see the * if you add, delete or rearrange windows, but simply resizing windows does not display the *. The * means you are in a modified View, which must be saved as a User View before you leave the measurement (if you don't save it, the instrument will save it for you).

Note also that the Restore Layout to Default control is no longer grayed out. If you press this control it restores the Basic View to its default state. Restore Layout to Default becomes available when you add, delete or rearrange windows **and** when you resize them; otherwise it is grayed out.

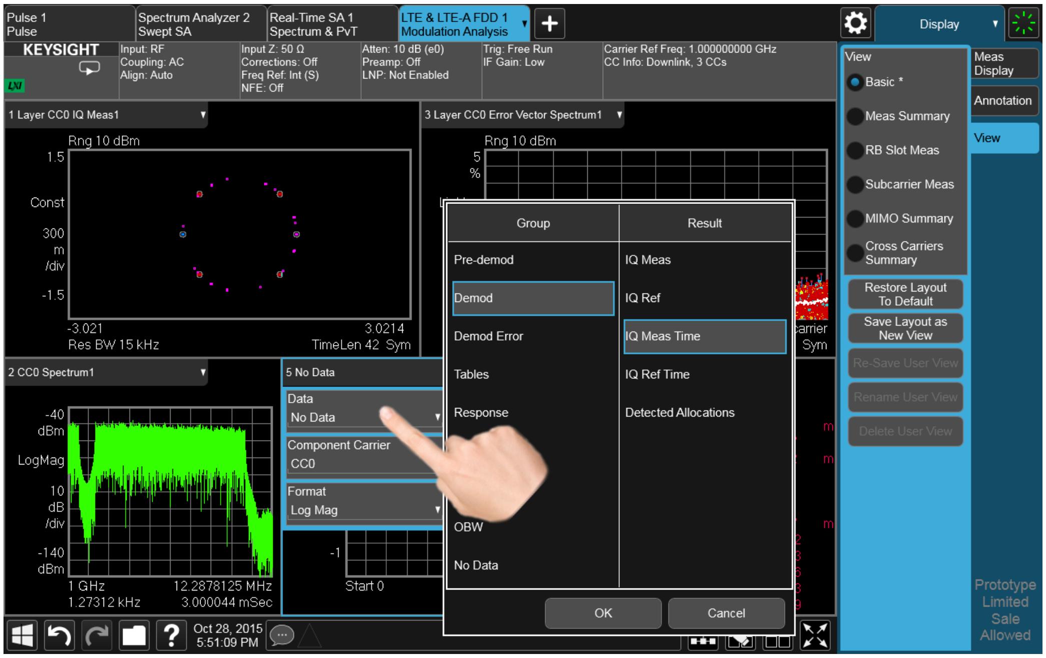
You can add more windows with the "+" arrow symbols. Note that the "+" arrow symbols only appear if the current measurement has more windows available to display. If you are already displaying all the measurement's windows, the "+" symbols disappear.

You can exit the View Editor by again tapping the Edit View icon.

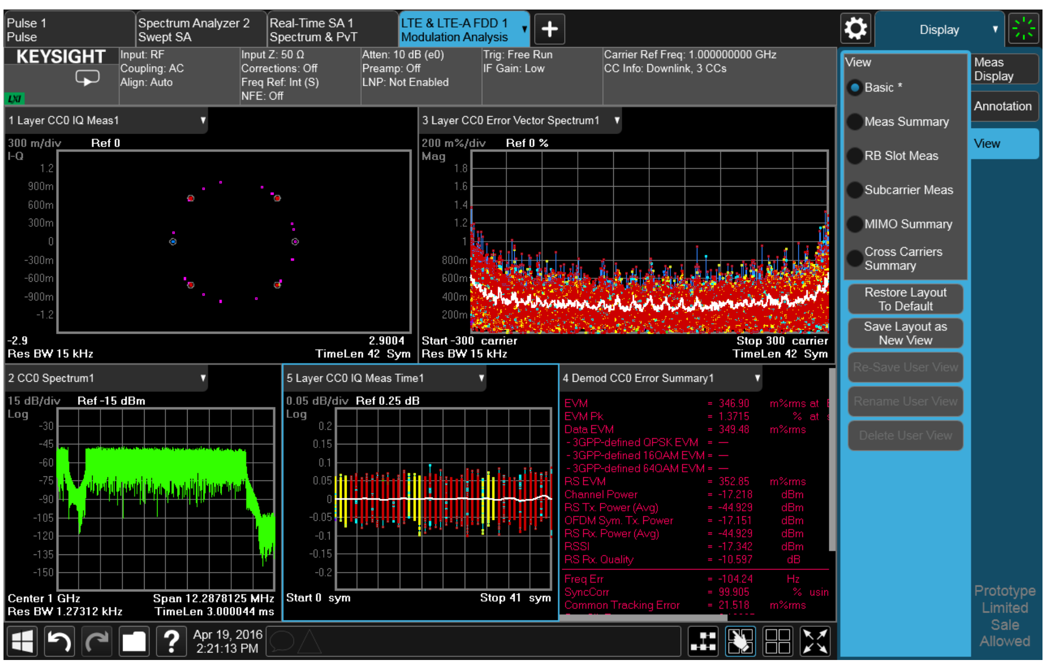
You can specify which result you want to see in the new window by tapping its title region.



A panel drops down, containing a Data control for specifying window results. Some measurements, such as LTE-A in this example, also provide controls on this dropdown for specifying other window parameters, such as the Component Carrier and Data Format, Tap the Data control and you will see a list of available results for the window. In some cases, as in LTE-A, this will be a cascading list, due to the number of results available:



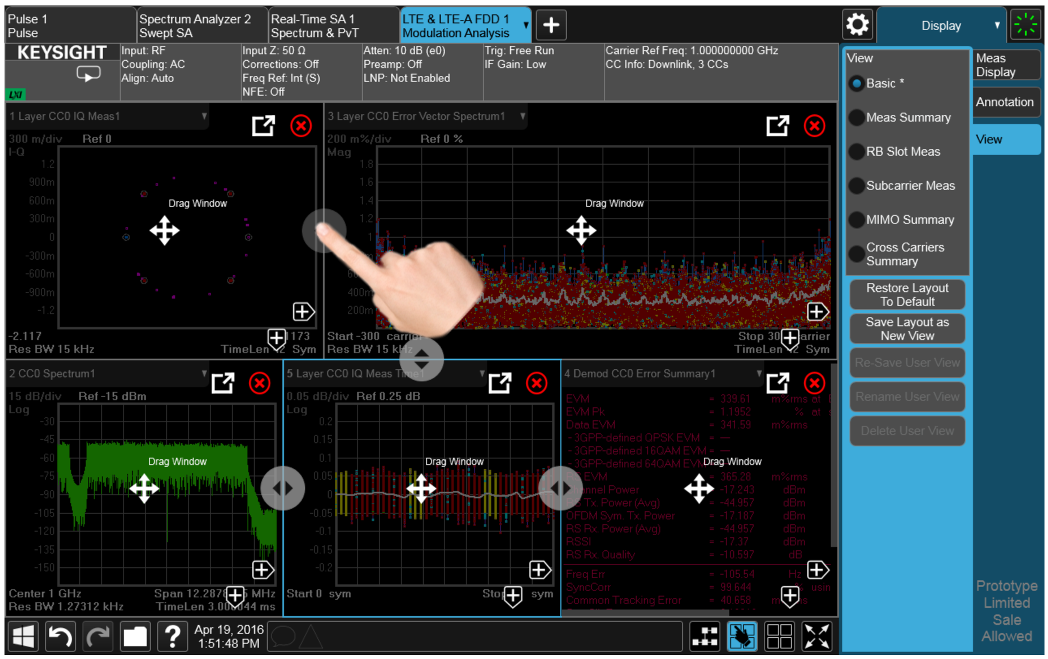
Choose the result you want and tap OK. Here we have chosen IQ Meas Time from the Demod group:



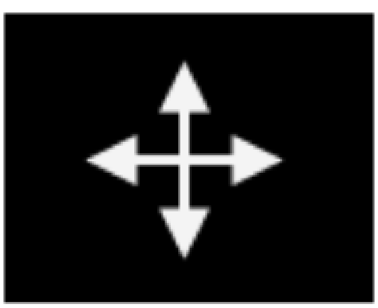
Your new, edited User View is now ready to use.

2.17.2 To Resize or Rearrange Windows in a View

Sometimes you may wish to resize a window. To do this go back into the View Editor and note the large, translucent white circles along the edges of the draggable borders. These are the “resize handles”. You can resize the windows by dragging these handles. Note that in their quiescent state they are slightly translucent; when you touch one it turns solid white, indicating that it is draggable. If you touch and drag one of them it moves the axis to which it is attached.

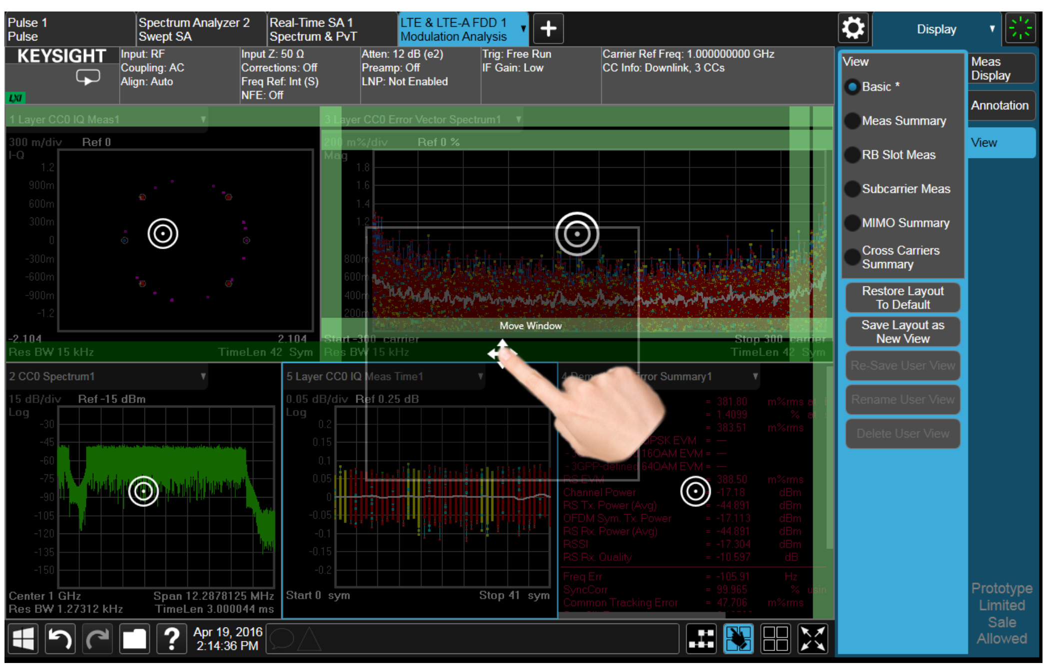


Another feature that comes with the View Editor is the ability to move windows around. You do this by dragging the four-arrow objects in the center of the window; the whole window goes along. Actually you can touch and drag anywhere in the window (except on one of the arrows or the delete circle) and it will drag, but the four-arrow objects give you an indication and a convenient finger target.

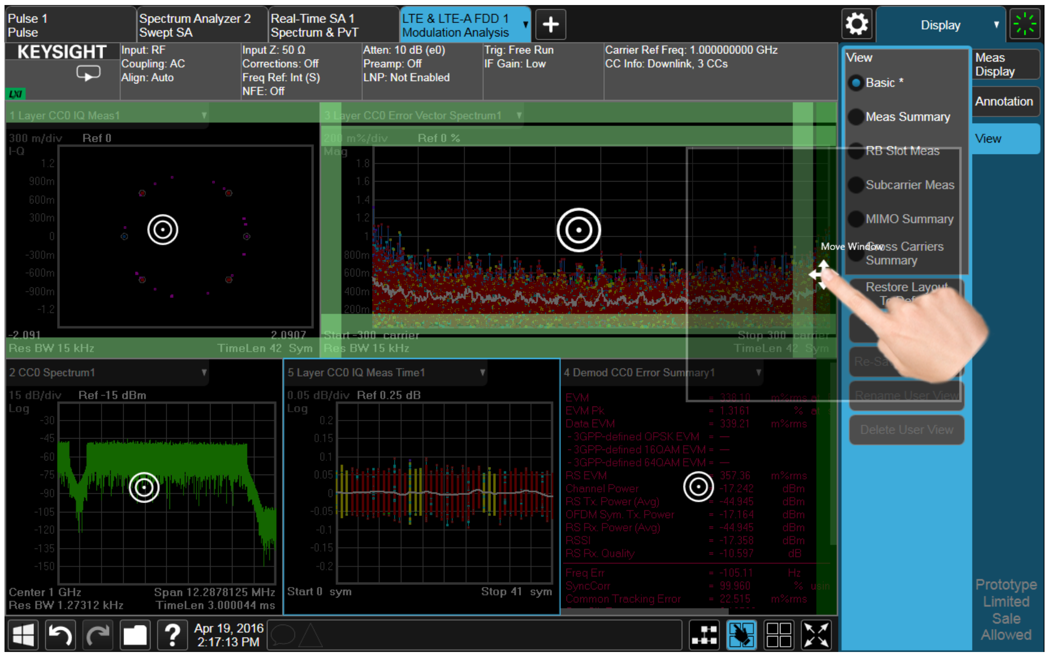


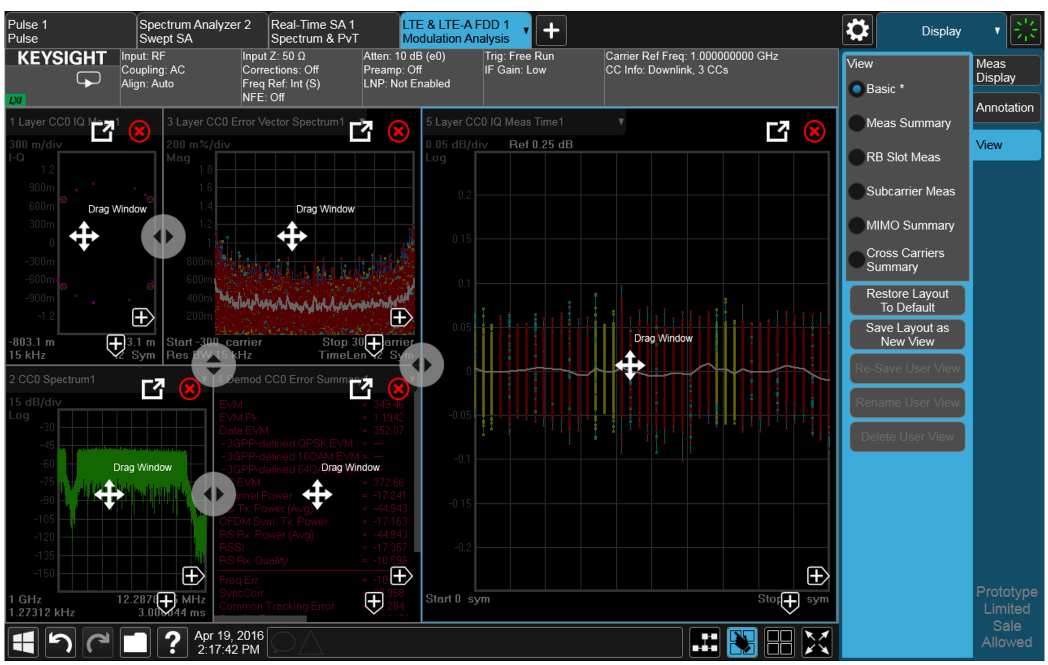
The outline of the window appears as it is being dragged. When you start to drag a window, target symbols appear in the other windows:

If you drop a window on one of the targets, it swaps positions with the target window. If you drag a window's center into another window, green stripes appear on the edges to show you where the window will go when you release it:



When you hover over one of the stripes it gets dimmer, to show the position the window being dragged will take on. If you release a window over an inner stripe, the window you are dragging and the window over which you were hovering resize to share the space the target window originally occupied. If you release a window over an outer stripe, as shown below, the window you are dragging takes on a new position outside the array of other windows:



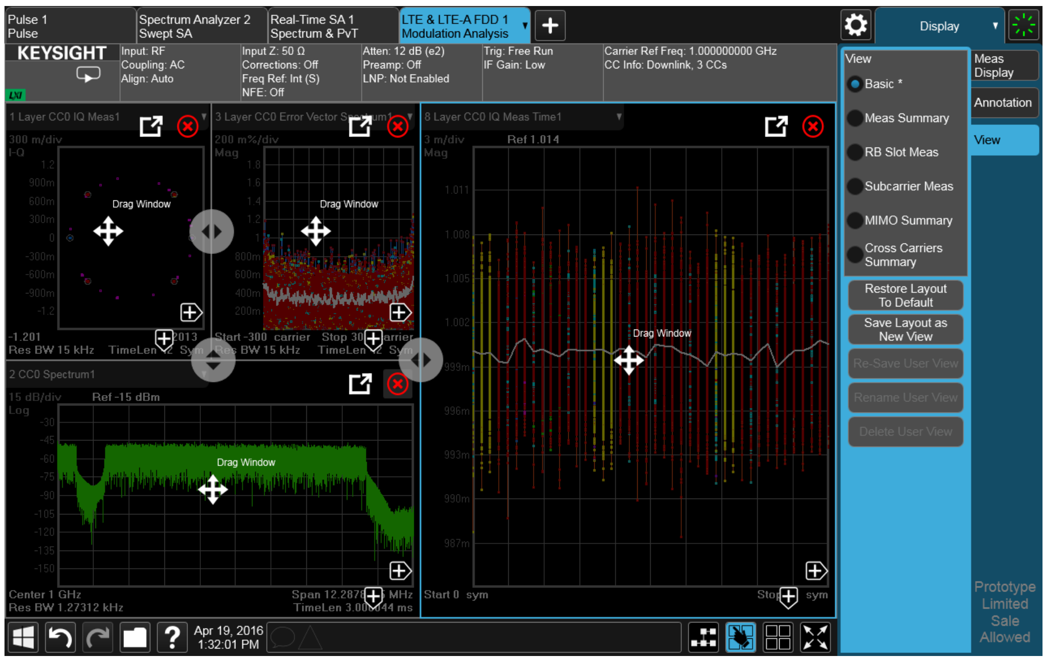


In either case, one or more of the remaining windows resize to occupy the space formerly occupied by the window you were dragging.

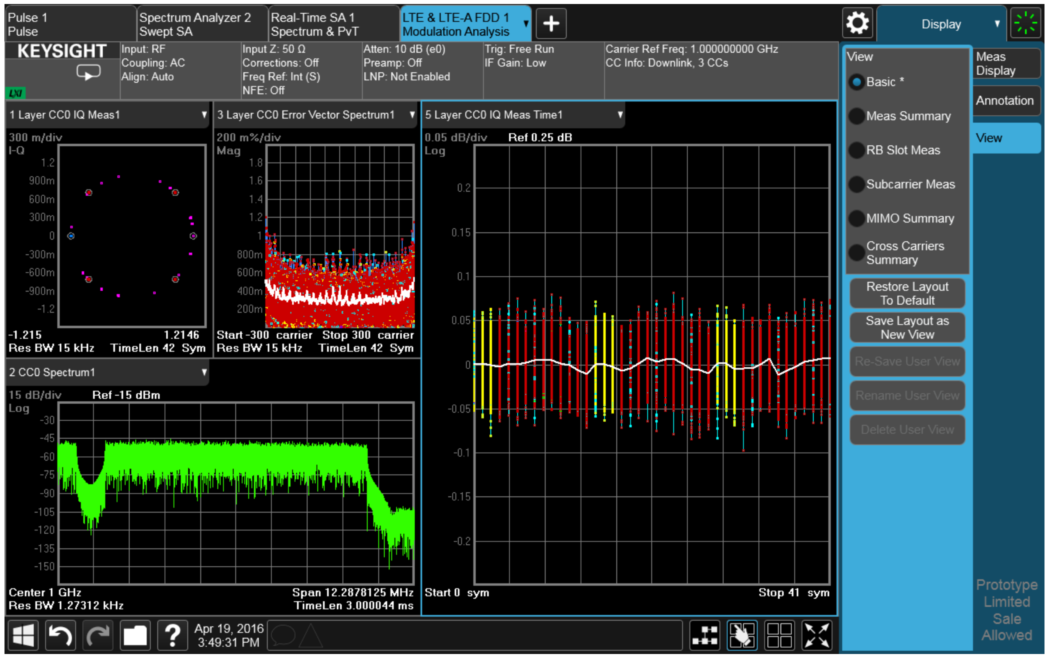
2.17.3 To Delete a Window from a View

The View Editor also lets you delete a window. To do this, tap one of the circled red X's, as shown below.

There has to be more than one window for you to see the circled red Xs.



Now press the View Editor button (the blue hand) to exit the View Editor. At this point, you have an edited Predefined View, as shown by the * next to Basic:



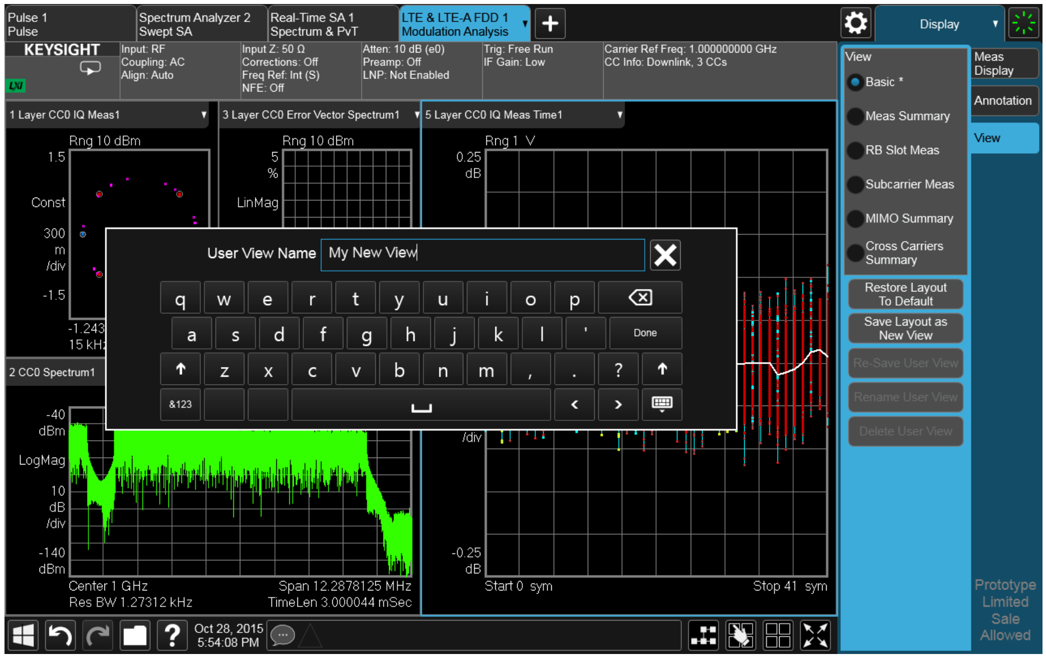
When you are finished with it, you can restore the Layout to the default for Basic by pressing “Restore Layout to Default”. Or you can save your edited View as a “User View” (if you exit the measurement without saving the edited View, the instrument will save it for you as a User View called “Autosaved”).

If you clone the current Screen by pressing the “+” tab, the modified Predefined View will be saved as a User View called “Autosaved”, and it will be available in the new Screen.

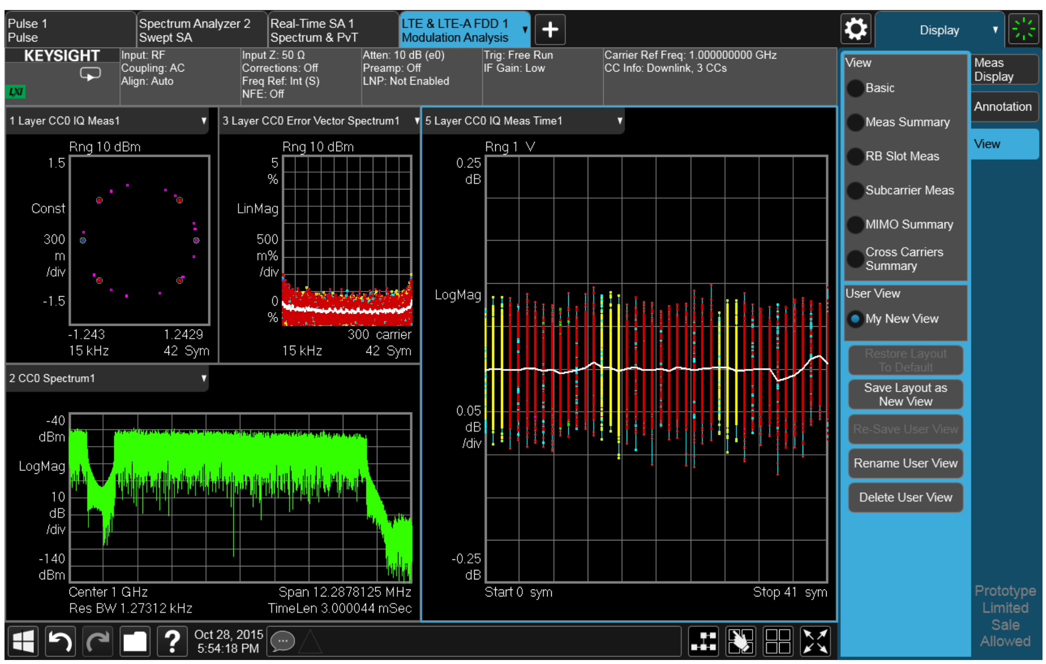
2.17.4 To Save a User View

See also "Transferring User Views Between Instruments" on page 168

To save your new View as a User View, tap the “Save Layout as New View” control. You will get an alpha keyboard that lets you name your new View; the default is the old View name with a number. Below, we have typed in “My New View”:

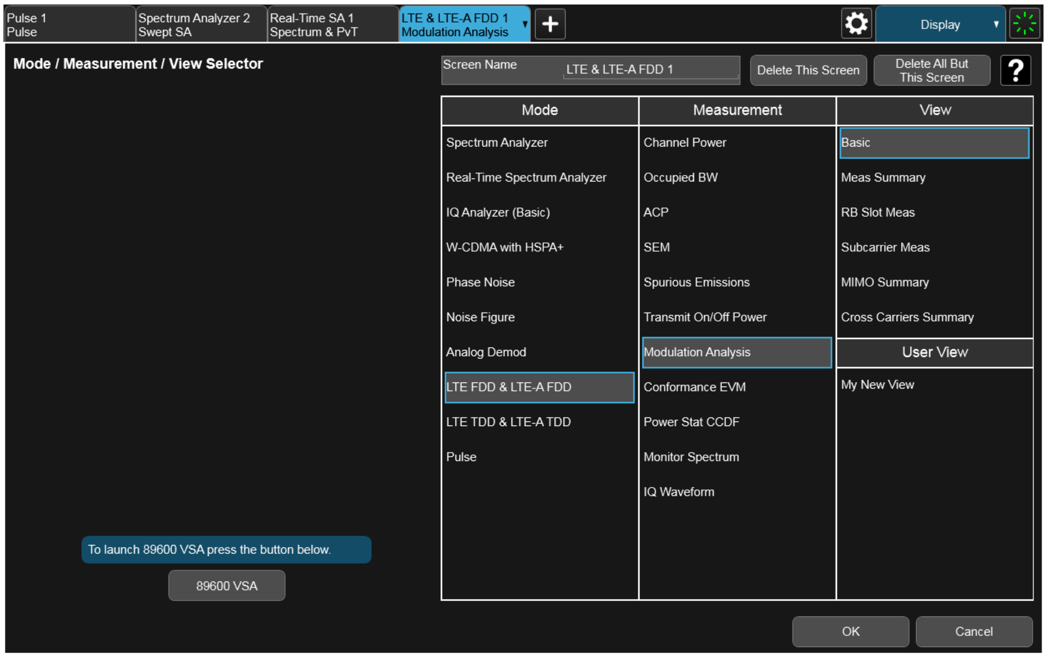


When you tap “Done”, the View is saved:



Notice the User View region which has appeared on the menu panel above, with the new User View called “My New View. Notice also that “Basic” has returned to its original, unedited state and the * is gone from its name. Note also that “Restore

Layout to Default" is grayed out. Note also that if you go to the Mode/Meas dialog, you will see the User View there as well:



When naming a new View, you must choose a name that is not already in use for any User View in any measurement; this is because User Views get written to permanent memory and are available to all instances of the Measurement in any screen. They survive a Mode Preset and also survive shutdown and restart of the application.

Transferring User Views Between Instruments

To transfer a User View to another instrument, you must copy the desired file to a portable drive or to your network and then copy it to the target instrument.

When you save a User View, a file is created (or updated if it already exists) containing all the User Views for the current measurement. All of these files are saved on the D: drive in the instrument, in the folder:

`D:\Users\Instrument\My Documents\UserViews`

(assuming you are logged in as Instrument, which is the default).

Look for the file for your measurement. The file naming convention is:

`ModeName.MeasName.layout`

Where `ModeName` is the long-form SCPI parameter for the `:INST:SEL` command for your Mode, and `MeasName` is the long-form SCPI parameter for the `:CONF` command for your Measurement.

For a full list of all `ModeName` parameters, see **Index to Modes** in "Mode" on page 87.

The following is a full list of all `MeasName` parameters.

Measurement Name	SCPI ID
ACP, Adjacent Channel Power	`ACPower`
AM	`AM`
AM Depth	`AMD`
Amplitude Probability Distribution	`APD`
Audio Distortion	`AUDDist`
Audio Frequency	`AUDFreq`
Audio Level	`AUDLevel`
Audio SINAD	`AUDSinad`
Automatic Direction Finder	`ADF`
Channel Power	`CHPower`
Code Domain	`CDPower`
Combined GSM	`CGSM`
Combined WCDMA	`CWCDma`
Complex Spectrum	`SPECtrum`
Conformance EVM	`CEVM`
Custom OFDM	`OFDM`
Digital Demod	`DDEMod`
Disturbance Analyzer	`DANalyzer`
EDR In-band Spurious Emissions	`IBSPurious`
EVM	`EEVM`
Fast Capture	`FCAPture`
Fast Spectrum	`FSPectrum`
FM	`FM`
FM Deviation	`FMDeviation`
FM Stereo	`FMStereo`
Frequency Counter	`FCOunter`
Frequency Scan	`FSCan`
GMSK Phase & Freq Error	`PFERror`
Group Delay	`GDELay`
Harmonics	`HARMonics`
HRP UWB Demodulation	`HUWB`
Instrument Landing System	`ILS`
IQ Waveform	`WAVeform`
LE In-band Emissions	`IBEMissions`
List Power Step	`LPSTep`

Measurement Name	SCPI ID
List Sequencer	LSEQuencer
List Sweep	LIST
Log Plot	LPLot
LoRa (CSS) Demodulation	LORA
Marker Beacon	MBE
Mod Accuracy	RHO
Modulation Analysis	EVM
Modulation Distortion	MODDist
Modulation Rate	MODRate
Modulation SINAD	MODSinad
Monitor Spectrum	MONitor
Noise Figure	NFIGure
Occupied BW / Output Spectrum BW	OBWidth
Output RF Spectrum	EORFspectr
Phase and Amplitude vs Time	PAVTime
PM	PM
PM Deviation	PMDeviation
Power Amplifier	PAMPlifier
Power Control	PCONtrol
Power Stat CCDF	PSTatistic
Power vs Time	EPVTime
Pulse	PULSe
QPSK EVM	EVMQpsk
Real Time Scan	RTSC
RF Power	RFPower
SEM	SEMask
Spectral Flatness	FLATness
Spectrum & PvT	RTSA
Spot Frequency	SFRequency
Spurious Emissions	SPURious
Streaming	STReaming
Strip Chart	SCHart
Swept SA	SANalyzer
TOI	TOI

Measurement Name	SCPI ID
Transmit Analysis	TX
Transmit On/Off Power	PVTime
Transmit Power (Burst Power)	TXPower
Tuned RF Level	TRFLevel
Tuned RF Level with Tracking	TTRF
Tx Band Spur	ETSPur
VHF Omni-Directional Range	VOR

Examples:

- The User View file for the Swept SA measurement is `SA.SANalyzer.layout`
- The User View file for the ACP measurement in the WCDMA mode is `WCDMA.ACPower.layout`

Copy the desired file to a thumb drive or to your network. Then go to the target instrument and copy the file into the `D:\Users\Instrument\My Documents\UserViews` directory on that instrument (again, assuming you are logged in as Instrument).

Note that copying this file to another instrument will overwrite the file already in that instrument, if any, and will destroy any User Views that might have been created on that instrument.

Note that when you delete the last User View for a measurement, the file is removed.

2.17.5 To Rename a User View

You can rename a User View by selecting that View and tapping “Rename User View.” You can also re-edit a User View; if you do this, an asterisk will appear next to the User View’s name. You can then tap “Re-Save User View to save it back to its existing name, or “Save Layout as New View” to add another, new User View.

2.17.6 To Delete a User View

You can delete a User View by doing the following:

1. From the "Mode/Meas/View Dialog" on page 86, *or* from the **View** menu, select the User View that you want to delete
2. Switch to the **Display** menu

3. Select the **View** tab

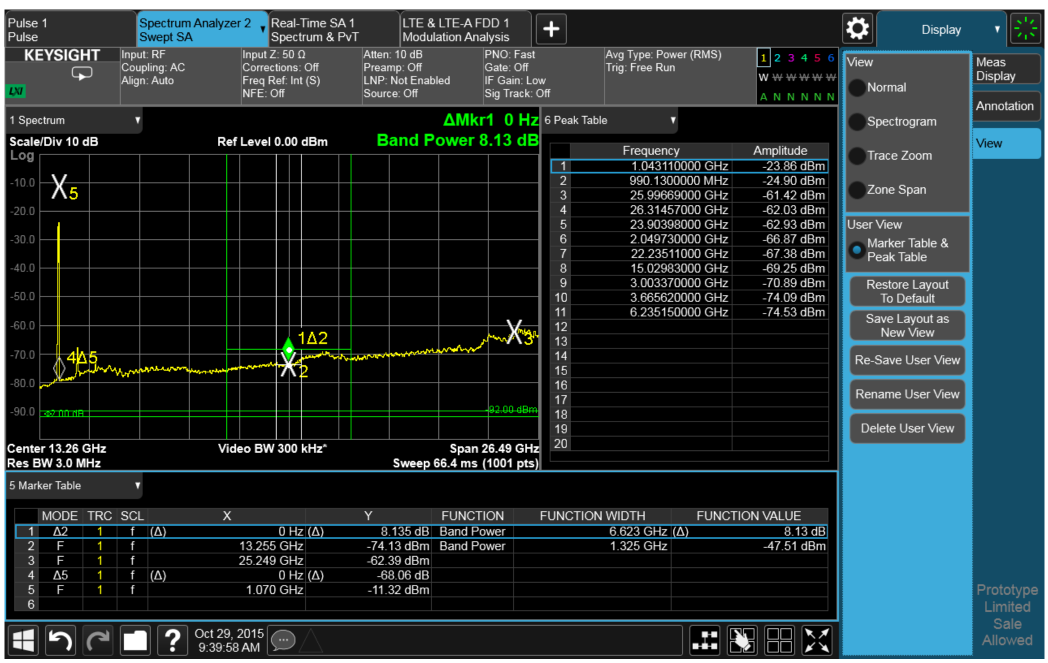
4. Tap **Delete User View**

2.17.7 To Delete All User Views

You can delete all User Views by tapping “Delete All User Views.” The default view becomes the current view for the Measurement if a User View was the current view when this control was pressed.

2.17.8 Use Case: Displaying Marker and Peak Tables

One common application for User Views is to create a View that allows the Spectrum Analyzer to display both a Marker Table and a Peak Table at the same time. To do this, simply add a Marker Table Window and a Peak Table window to the Spectrum window of the Swept SA measurement. The result is shown below; note that the new View has been named “Marker Table & Peak Table”:



NOTE: There are legacy displays like Marker Table, Peak Table, Measure at Marker and Gate View, which are not Views but special display modes. These are retained for backwards compatibility, however they are turned on and off with switches and do not use the View system. Turning on one of these switches does not create a modified View, it merely adds the specified window to the current View; turning the switch back off removes the window. While the switch is on, NO View shows as selected in the View menu. These switches are grayed out if you are in a modified View or a User View. Since only one of these switches can be on at a time, and because these switches turn off on a Preset, User Views offer a superior way of adding windows than using the switches.

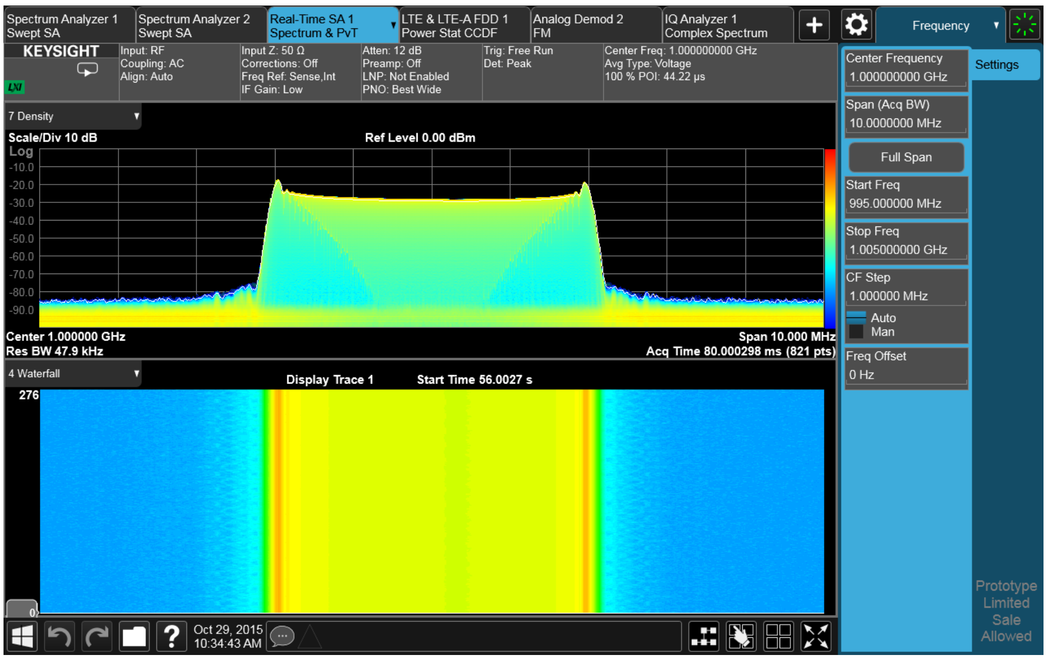
Some measurements do not support User Views; these do not allow adding, deleting or rearranging windows, however they do allow resizing windows. In these measurements you can get into the View Editor but the Add icons, Delete icons and Move icons will not appear. You can still resize the windows and in some cases (e.g. Noise Figure) you can still change window contents.

2.17.9 View Editor Remote Commands

Remote Commands for User Views can be found in the documentation for the **Display, View** tab.

2.18 Multiscreen

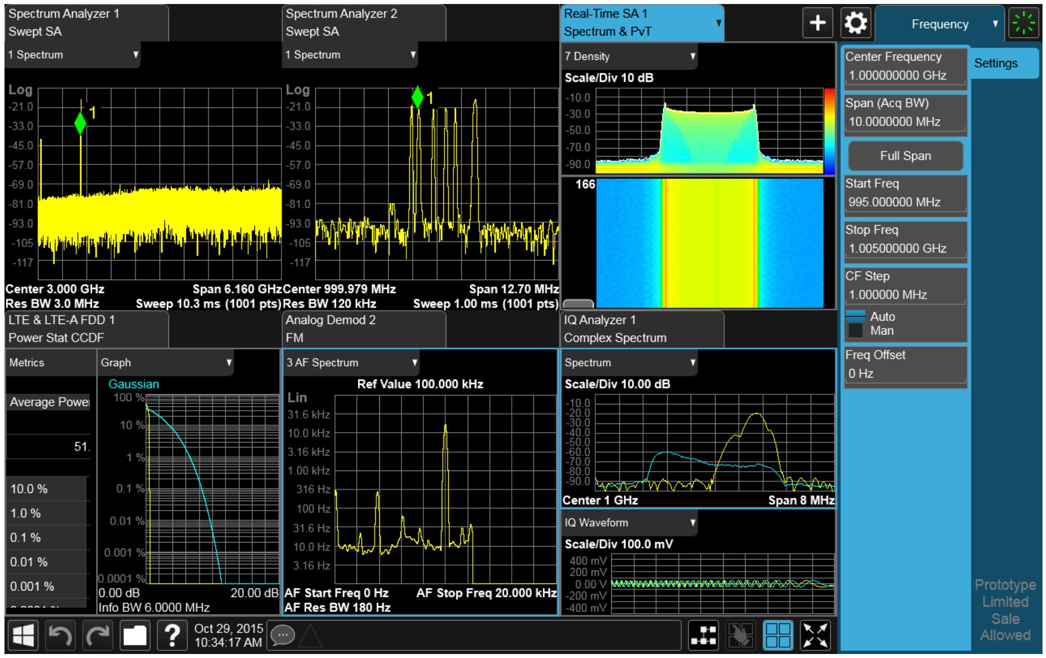
You can configure up to 16 different Screens at a time. Normally, you only see one Screen, and the set of configured screens is shown across the top of the display in a series of "Screen Tabs" on page 85. Touching any screen’s tab brings it to the foreground, makes it the current Screen and starts it updating.



Multiscreen view lets you display all of the configured Screens at once.

You can switch to Multiscreen View by pressing this button in the "Control Bar" on page 135 at the bottom right of the screen:

Multiscreen View looks like this:



While in Multiscreen View, the button changes from a black background to a blue background:

To exit Multiscreen view, tap the button again.

Multiscreen View cannot be activated if only one screen is configured.

Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows arranged in Views. You can configure multiple instances of the same Mode along with any combination of other Modes.

In Multiscreen View, just as in Single Screen View, only one screen is active.

You switch Screens by tapping the Screen Tab you want, or when in Multiscreen View, you can tap the Screen itself. When you switch Screens, the current Screen’s state and measurement results are preserved, the new Screen’s previous state and data are loaded, and the new Screen starts running its Mode.

In Multiscreen View:

- The Meas Bar does not display
- The Screens are presented in an array of equal size boxes, except where the number of Screens means some have to be different sizes (as when you have 3 Screens, 5 Screens, etc.).

- Each Screen has a tab that contains the name of the Mode and Measurement in the box and a number associated with the instance of that Mode. You can enter a custom Screen name that replaces the Mode name, by going into the Mode/Meas dialog
- There is always one and only one selected Screen. It is indicated by a blue tab. Only the selected Screen is actually running a measurement and updating its display
- The selected window in the selected screen is the context for the current menus. It is the only window on the display with a blue border
- As you go from screen to screen, each screen remembers the last menu that was active in that screen and restores it as the active menu

In Multiscreen View, as in Single Screen View, tapping the blue tab or pressing the Mode/Meas front panel key opens the "Mode/Meas/View Dialog" on page 86 which allows you to change the Mode (or Measurement or View) being displayed in that Screen.

Remote Command	`:INSTrument:SCReen:MULTiple[:STATe] OFF | ON | 0 | 1` `:INSTrument:SCReen:MULTiple?`
Example	`:INST:SCR:MULT ON`
Notes	If only one screen is configured, attempting to set Multi-Screen ON generates the error “-221, Settings conflict; Multi-Screen requires >1 screen”
Preset	OFF

For more information, see the following:

- "Select Screen" on page 176
- "Screen List (Remote only command)" on page 177

2.18.1 Select Screen

You can select a screen by touching its tab or, in "Multiscreen" on page 174 mode, touching the screen itself. Selecting the Screen activates the screen and suspends the previously selected screen (if any).

Remote Command	`:INSTrument:SCReen:SELect <screen name>` `:INSTrument:SCReen:SELect?`
Example	`:INST:SCR:SEL “Baseband”`
Notes	If the <screen name> is specified but not found in the list of Screens, the error message “-224, Illegal parameter value; Screen Name not found” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated

Preset	Returns the name of the active screen

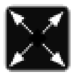
2.18.2 Screen List (Remote only command)

You can obtain a list of currently configured Screens. This permits your remote program to manage screens for selection, renaming, or deletion.

Remote Command	`:INSTrument:SCReen:CATalog?`
Example	`:INST:SCR:CAT?`
Notes	The query response is a comma separated list of Screen Names. If only 1 Screen is configured, there is no trailing comma For R&S compatibility, the following query is also available: `:INSTrument:SCReen:LIST?`
Preset	Returns list of currently configured Screens

2.19 Fullscreen

The Fullscreen button is in the "Control Bar" on page 135, at the lower right corner of the display.



When **Full Screen** is pressed the measurement window expands horizontally over the entire instrument display. The screen graticule area expands to fill the available display area.

It turns off the display of the menu panel, however the controls that drop down from the Meas Bar and on-screen annotation are still available, and you can still drag the trace and markers and perform a pinch zoom, so you can still operate the instrument.

Pressing **Full Screen** again while Full Screen is in effect cancels Full Screen.

You can get even more screen area for your data display by turning off the Meas Bar using the Annotation tab of the Display menu)

Full Screen is canceled by the **Preset** key.

Remote Command	`:DISPlay:FSCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:FSCReen[:STATe]?`
Notes	This was set to Off by :SYST:DEF MISC in MXA1, but not by Preset. It is no longer set Off by :SYST:DEF MISC, since it is now meas global instead of mode global
Preset	Unaffected by Preset but set to Off by Restore Misc Defaults or shutdown and restart
State Saved	Not saved in instrument state
Backwards Compatibility SCPI	`:DISPlay:MENU[:STATe] OFF | ON | 0 | 1` This emulates ESA full screen functionality, which is the same as the FSCReen command in PSA except that the sense of on/off is reversed (that is, OFF means the menus are OFF, so Fullscreen is ON) and the default is ON (meaning Fullscreen is OFF)
Backwards Compatibility Notes	In ESA/PSA, Full Screen was turned on with a softkey, so pressing any other key turned Full Screen off. In the X-Series, because a hardkey is provided to turn this function on and off, pressing any other key no longer turns off Full Screen

3 Spectrum Analyzer Mode

Spectrum Analyzer Mode is used for general purpose measurements. It consists of the Swept SA measurement, plus a set of measurements that are collectively referred to as the *PowerSuite*.

Swept SA Measurement

Measurement	SCPI ID	Notes
Swept SA	SANalyzer	Basic spectrum analysis measurement in swept and zero span (as well as "Swept FFT")

PowerSuite Measurements

Measurement	SCPI ID	Notes
Channel Power	CHPower	Used in this and other modes to make specific power measurements
Occupied Bandwidth	OBWidth	
Adjacent Channel Power	ACPower	
Power Stat CCDF	PStatistic	
Burst Power	BPOWer	
Spurious Emissions	SPURious	
Spectrum Emissions Mask	SEMask	
Phase and Amplitude vs Time	PAVTime	
TOI	TOI	Signal quality measurements
Harmonics	HARMonics	
List Sweep	LIST	Programs a list of frequency points to rapidly move between

To access the built-in help for this Mode, it must be the currently-active Mode. If it is not, exit help (**Esc** key), select this Mode, then reopen help.

Example	`:INST:SEL SA` `:INST:NSEL 1`
Dependencies	The Mode must be installed and licensed in your instrument before it is available for use The Swept SA measurement is available in this Mode if you have licenses N9060EM1E or N9060ES1E installed in your instrument

	Measurements in this Mode other than Swept SA are available only if you have licenses N9060EM1E, or N9060ES1E and N90EMPSMB, installed in your instrument
Status Bits/OPC dependencies	Changing Modes resets all SCPI status registers and mask registers to their power-on defaults. Therefore, event or condition register masks must be re-established after a Mode change

3.1 Measurement Commands

Commands for selecting each measurement are listed below. Commands relating to Views and Windows for each measurement are described in the documentation for that measurement.

Example	Having selected SA Mode, you can select the measurement using the following commands:
	Swept SA: `:CONFigure:SANalyzer`
	Channel Power: `:CONFigure:CHPower`
	Occupied Bandwidth: `:CONFigure:OBWidth`
	Adjacent Channel Power: `:CONFigure:ACPower`
	CCDF: `:CONFigure:PSTatistic`
	Burst Power: `:CONFigure:BPOWer`
	Spurious Emissions: `:CONFigure:SPURious`
	Spectrum Emissions Mask: `:CONFigure:SEMask`
	TOI: `:CONFigure:TOI`
	Harmonics: `:CONFigure:HARMonics`
	List Sweep: `:CONFigure:LIST`
	Phase and Amplitude vs Time: `:CONFigure:PAVTime`
	Query the currently-selected measurement: `:CONFigure?`
Preset	`SANalyzer`
State Saved	Instrument State

3.2 Swept SA Measurement

The Swept SA measurement lets you perform “traditional” Spectrum Analysis, that is, Swept and Zero Span measurements, as well as “Swept FFT” analysis (FFT analysis presented as though it were swept).

Swept Spectrum Analysis (Freq Domain)

The instrument sweeps the LO to generate a heterodyned IF signal that can be detected to analyze the signal content of a range of frequencies. The x-axis of the display is frequency, the Y Axis is amplitude.

Swept FFT Analysis (Freq Domain)

In some cases, there is an advantage to not actually sweeping the LO, but instead analyzing the signal by taking a time record and performing FFT analysis. This is what is done in swept FFT analysis, but the data is still presented as though it were a sweeping spectrum analyzer. The x-axis of the display is frequency, the Y Axis is amplitude.

Zero Span Analysis (Time Domain)

In Zero Span analysis, the instrument stops sweeping the LO, placing it at the center frequency, and then takes time data from the detector while stopped at that frequency. Because the LO is not moving, the frequency span is zero. The time data is presented left to right across the screen just like on an oscilloscope. The x-axis of the display is time, and the Y Axis is amplitude.

All of the tools such as markers, peak tables, limit lines, trace math, N dB points, and marker functions are available in Zero Span measurement analysis, although some work differently in the time and frequency domains. See the Span control description under the Freq front panel key for detail on the user interface differences between Swept analysis and Zero Span analysis.

Swept SA Measurement Commands

The general functionality of "CONFigure" on page 2732, "INITiate" on page 2733, "FETCh" on page 2733, "MEASure" on page 2735, and "READ" on page 2734 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF:<Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

The tables below list measurement commands for this measurement.

Command	Function
`:INITiate:SANalyzer`	Initiates a trigger cycle for the `SAN` measurement, but does not return any data. You must then use `:FETC:SAN[n]?` to retrieve data Does not change any measurement settings
`:CONFigure?`	Returns the long form name of current measurement, in this case, `SANalyzer`
`:CONFigure:SANalyzer`	Selects `SAN` measurement with Meas Setup settings in preset state – same as Meas Preset
`:CONFigure:SANalyzer:NDEFault`	Selects `SAN` measurement *without* affecting settings

The following queries are used to retrieve data. The type of data returned depends on the value of `n`.

Command	Function
`:FETCh:SANalyzer[n]?`	Retrieves the data defined by n
`:MEASure:SANalyzer[n]?`	Switches to `SAN` measurement, restores default values, starts the measurement, then retrieves the data defined by n
`:READ:SANalyzer[n]?`	Starts the measurement, then retrieves the data defined by n

For the measurement data queries `:FETCh`, `:MEASure` and `:READ`, the data returned depends on `n` as follows. Note that the marker values are x, y pairs.

n	Data Returned	
0	Returns the following comma-separated results:	
	1	1 if there is any margin or limit failure, otherwise 0
	2	0 (future)
	3	0 (future)
	4	0 (future)
	5	N dB points result (not a number if off)
	6	Terminal average count (the Average Number as set in the UI)
	7	Number of points in the sweep
	8	0 (future)
	9	0 (future)
	10	0 (future)
	11	Marker 1 value (y)

n	Data Returned	
	12	Marker 2 value (y)
	13	Marker 3 value (y)
	14	Marker 4 value (y)
	15	Marker 5 value (y)
	16	Marker 6 value (y)
	17	Marker 7 value (y)
	18	Marker 8 value (y)
	19	Marker 9 value (y)
	20	Marker 10 value (y)
	21	Marker 11 value (y)
	22	Marker 12 value (y)
Not specified, or 1	Returns Trace 1 data as a list of x,y pairs. The y-values are in the current Y Axis Unit of the instrument. The x-axis values are the values of the trace, in the x-axis scale units of the trace (Hz for frequency domain traces, seconds for time domain traces) When querying trace data, it is best if the instrument is not sweeping during the query. Therefore, select **Single Sweep, or Update**=`OFF` when querying trace data from the instrument	
2	Returns Trace 2 data as a series of x,y pairs	
3	Returns Trace 3 data as a series of x,y pairs	
4	Returns Trace 4 data as a series of x,y pairs	
5	Returns Trace 5 data as a series of x,y pairs	
6	Returns Trace 6 data as a series of x,y pairs	
7	Returns Peak Table data as a series of x,y pairs. If the Delta to Limit column is on it returns it as a series of x,y,delta triplets. If a cell is showing `---` it is returned as NaN. The data is returned in the current sort order as displayed in the Peak Table If a query of Peak Table results is requested and the Peak Table is not on, an error event is generated, “Settings Conflict; Pk Table must be on to query Pk Table results”	
8	Returns Marker Table data as a series of comma separated values. The marker table returns comma separated values in the following form: `<Marker Number>,<Marker Trace>,<X>,<Y>,<Marker Function Width>,<Marker Function Value>` Only markers that are enabled are included. If the Marker function is `OFF`, then Marker Width and Marker Function Value are returned as NaN (“Not a Number”, 9.91e+37). The data is returned in the current sort order as displayed in the Marker Table If a Marker Table results query is requested and the Marker Table is not on, an error event is generated, “Settings Conflict; Mkr Table must be on to query Mkr Table results”	
9	Returns Spectrogram data as a series of comma separated values. The spectrogram table returns comma separated values in the following form: `<Slice 0>,<Time of Slice 0>,<Slice 0 X[0]>,<Slice 0 Y[0]>, <Slice 0 X [1]>,<Slice 0 Y[1]>,…, <Slice 0 X[N]>,<Slice 0 Y[N]>,<Slice 1>,<Time of Slice`	

n	Data Returned
	`1>,…` This matches the data format of a saved Spectrogram Meas Results file If a Spectrogram results query is requested and the Spectrogram is not on, an error event is generated, "Settings Conflict; Spectrogram must be on to query Spectrogram results"
10 & above	Future use

Data Query (Backwards Compatibility)

Notes	Returns the same data as `:FETCh:SANalyzer[n]?`. As with `:FETCh`, if `n` is not sent, assumes `n` = 1, and returns the Trace 1 data Uses the data setting specified by the `:FORMat:BORDer` and `:FORMat:DATA` commands and can return real or ASCII data. (See command descriptions: "Format Data: Numeric Data (Remote Command Only)" on page 2739and "Format Data: Byte Order (Remote Command Only)" on page 2740)
Backwards Compatibility SCPI	`:CALCulate:DATA[1]|2|…|9?`

3.2.1 Views

The Swept SA measurement has four predefined views:

- "Normal" on page 186
- "Spectrogram" on page 186
- "Trace Zoom" on page 186
- "Zone Span" on page 187

Some are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is **Frequency**, unless otherwise specified in the View description.

Remote Command	`:DISPlay:VIEW[:SELect] NORMal | TZOom | SPECtrogram | ZSPan`
Example	Set **Zone Span** view: `:DISP:VIEW ZSP`
Dependencies	All views except `NORMal` require option EDP to be licensed. If the SCPI is sent to select any other View and EDP is not licensed, an error is generated
Preset	`NORMal`
State Saved	Saved in instrument state

3.2.1.1 Normal

Windows: "Spectrum" on page 188

Single window view of the frequency domain or zero span. This is the classic SA view. This is also the view into which the instrument switches whenever you do anything that causes the frequency limits to change, for example:

– If you switch inputs (for example, if you switch from the RF Input to External Mixing)

– If, while in External Mixing, you edit the Harmonic Table

– If, while in External Mixing, the Mixer Preset changes (for example, if you change from A-band to V-band etc.)

Example	`:DISP:VIEW NORM`

3.2.1.2 Spectrogram

Windows: "Spectrum" on page 188, "Waterfall" on page 192

Provides a quick look at a history of 1000 traces. In **Spectrogram** View, the display opens a second window (the **Waterfall** window), in which trace history is displayed, below the main Swept SA display window (the **Spectrum** window). Each horizontal line in the spectrogram display represents one historical trace. The data streams upwards from newest to oldest; the latest trace displays on the bottom and the oldest trace on the top.

Note that whenever you save state while in **Spectrogram**, and then recall the state, **Spectrogram** returns with all the settings just as they were when you saved the state, but not including the Spectrogram data itself. If you want to save the Spectrogram data, you can export it using Meas Results, and import it into a PC, although you cannot load it back into the instrument.

For detailed information about **Spectrogram** View, see the window description for "Waterfall" on page 192.

Example	`:DISP:VIEW SPEC`

3.2.1.3 Trace Zoom

Windows: "Spectrum" on page 188

In this view, the screen is split into two windows. The top window is a normal spectrum instrument window, and the bottom window (**Zoomed Trace**) shows a “zoomed” representation of the traces in the top window.

For more about **Trace Zoom**, see the window description for "Zoomed Trace" on page 190.

Example	`:DISP:VIEW TZO`

3.2.1.4 Zone Span

Windows: "Spectrum" on page 188, "Zone Spectrum" on page 189

In this view, the screen is split into two windows. The top window is a normal spectrum analyzer window, and the bottom window (**Zone Window**) shows a window whose span represents a region (zone) within the top window.

For more about **Zone Span**, see the window description for "Zone Spectrum" on page 189.

Example	`:DISP:VIEW ZSP`
Dependencies	In the **Zone Span** View, **Signal Track** is not allowed and is blanked

3.2.2 Windows

This section describes the windows that are available in Swept SA measurement.

With the addition of User Views to X-Series, Swept SA can now display most of its available windows at the same time. Some of the windows depend on constructs in the **Spectrum** window. Specifically:

- The **Zoomed Trace** window depends on a blue bar in the **Spectrum** window
- The **Waterfall** window depends on a color bar on the left of the **Spectrum** window

For this reason, it is best to *add* a new window and select the result that you want for the new window (for example, **Marker Table**) rather than *replace* the **Spectrum** window with a new result.

Window numbers for this measurement are:

1	"Spectrum" on page 188
2	"Zone Spectrum" on page 189
3	"Zoomed Trace" on page 190
4	"Waterfall" on page 192
5	"Marker Table" on page 198
6	"Peak Table" on page 198
7	"Measure at Marker" on page 199
8	"Gate" on page 199

The **Zone Spectrum** window *cannot* be added using the Result dropdown. To add a **Zone Spectrum** window, select the "Zone Span" on page 187 View.

For more about using the Window Title dropdown to change the window result or the **Edit View** screen to add and rearrange windows, see "View Editor" on page 153.

When using Remote Commands, send `:DISPlay:WINDow` to select a specific window, followed by the window number (for example, to select the **Zoomed Trace** window, you send `:DISP:WIND 3`). You must select a specific window in the following cases:

- Selecting the **Zoomed Trace** window allows you to do a bounded **Peak Search** function

3.2.2.1 Spectrum

Window #1

This is the fundamental window used in the Swept SA measurement and several other measurements. It displays Amplitude versus frequency information (or, in **Zero Span**, amplitude versus time). Unless otherwise noted, behaviors described in the Swept SA measurement description are assumed to be behaviors of the **Spectrum** window.

The **Spectrum** window always displays and cannot be deleted.

It appears in several views, as follows:

View	Size	Position
"Normal" on page 186	Full	--
"Spectrogram" on page 186	Half height, full width	Top
"Trace Zoom" on page 186	Half height, full width	Top
"Zone Span" on page 187	Half height, full width	Top
"Marker Table" on page 316	Half height, full width	Top
"Peak Table On/Off" on page 329	Half height, full width	Top
"Gate View On/Off" on page 2665	Half height, full width	Top

The **Spectrum** window has several special modes:

- When a **Waterfall** window is also displayed, as in the **Spectrogram** View, a color bar appears to the left of the **Spectrum** window and functions as the key to amplitude-color mappings in the **Waterfall** window

- When a **Zoomed Trace** window is also displayed, as in the **Trace Zoom** View, a blue shaded region appears in the **Spectrum** window, representing the region occupied by the **Zoomed Trace** window

– When a **Zone Spectrum** window is also displayed, as in the **Zone Span** View, an orange shaded region appears in the **Spectrum** window, representing the region occupied by the **Zone Spectrum** window

– When a **Marker Table** window is also displayed, as in the **Marker Table** View, the markers in the **Spectrum** window are described in the **Marker Table** window

– When a **Peak Table** window is also displayed, as in the **Peak Table** View, the peaks in the **Spectrum** window are described in the **Peak Table** window

– When a **Gate** window is also displayed, as in the **Gate** View, the **Spectrum** window holds the Spectrum controlled by the gating function

3.2.2.2 Zone Spectrum

Window #2

In the **Zone Span** view, the screen is split into two windows. The top window is a normal spectrum analyzer window, and the bottom window (**Zone Window**) shows a window whose span represents a region (zone) within the top window.

Views in which the **Zone Spectrum** window appears:

View	Size	Position
"Zone Span" on page 187	Half height, full width	Bottom

The data in the two windows represents two completely separate sweeps; each window sweeps *only* when the focus (thick green border) is on that window. It is important to understand that the data in the window without the focus remains unchanged until the focus is moved to that window.

In the top window, the zone region is indicated by a light orange shading and solid orange boundary lines. The **Zone Window** is not shaded orange; this emphasizes the fact that, unlike **Trace Zoom**, the data in the **Zone Window** does not match the top window but is from a separate sweep. You can set the span of the **Zone Window** using "Zone Span" on page 297 (in the **Frequency** menu) and you can set the center frequency of the **Zoom Window** using "Zone Center" on page 296 (in the **Frequency** menu).

Note that in **Zone Span**, the span of the top window cannot go below 10 Hz. The **Zero Span** toggle does not appear in **Zone Span**. If, on entry to **Zone Span**, the **Span** is 0 Hz, **Span** reverts to the last nonzero span. Also, if the span of the top window is between 10 Hz and 100 Hz on transition, **Zone Span** initializes to 10 Hz, not 10% of **Span**.

More Information

In **Zone Span**, the window with the focus (the selected window) is the window that updates. The selected window has a thick green border around it. When you enter the **Zone Span** view, the focus is always in the **Zone Window**, so it is the window that is updating. To change the focus, tap another window. **Single** and **Continuous** settings apply, so if the instrument is in **Single**, no sweep actually happens until it is initiated, or you go to **Continuous**.

NOTE: The selected window is the window to which virtually all key presses and SCPI commands are directed. Most control functions, such as **Center Frequency**, **Reference Level**, etc., apply only to the selected window. Similarly, any traces that are exported or queried while in **Zone Span** return the data from the currently active window. Because of this dependency, it is important to allow the SCPI system to synchronize after switching windows. Therefore, if you have just switched windows via SCPI (using `:DISP:WIND`) you should wait at least one second before sending any window-dependent command, to ensure that SCPI will direct the command to the correct window.

Transition Rules

When you enter the **Zone Span** view, the top window takes on all of the traces, markers and settings that were present in the **Normal** view. **Zone Center** is the same as the instrument **Center Frequency**, and **Zone Span** is 10 % of the instrument **Span**.

When you leave the **Zone Span** View, the current window traces and settings carry over to the next view. The traces from the other window will all now be gone. To mitigate this fact, whenever you save state while in **Zone Span**, and then recall the state, **Zone Span** returns just as it was when you saved the state, including all trace data and settings for both windows (of course, any traces that were updating when you did the save will load in an updating state, so their data will be erased after the first sweep). So, if you want to preserve the data in both windows, make sure you put the traces in View and save the state before you exit.

3.2.2.3 Zoomed Trace

Window #3

In the **Trace Zoom** view, the screen is split into two windows. The top window is a normal spectrum analyzer window, and the bottom window (**Zoomed Trace**) shows a “zoomed” representation of the traces in the top window.

Views in which the **Zoomed Trace** window appears:

View	Size	Position
"Trace Zoom" on page 186	Half height, full width	Bottom

The data in both windows is identical, but the bottom window typically shows fewer data points, spread across the whole display, which allows you to see the data in those points more clearly, particularly when the trace data in the top window is very dense (sweep points much greater than 1000).

The zoom region is indicated by a blue shading. In the top window, this indicates which subset of the data is zoomed in the bottom window. In **Swept Span**, you set the span of the bottom window using "Zoom Span" on page 295 and you set the center frequency of the bottom window using "Zoom Center" on page 294 (both in the **Frequency** menu). In **Zero Span**, you set the width of the bottom window using "Zoom Sweep Time" on page 486 and the center using "Zoom Center" on page 487 (both in the **Sweep** menu). You can also drag and pinch either trace or the blue region to set these values.

It is important to emphasize that the data and state in the two windows is *identical*. The **Zoom Window** is simply a close-up view of a region of the top windows' traces. Therefore, all traces and markers are the same in both windows; and any state changes you make affect both windows.

You set the number of sweep points shown in the **Zoom Window** separately from the top window. Changing the number of points in the top window does not change **Zoom Span**; hence the number of points in the bottom window changes by the same proportion as the change in the top window. Conversely, changing the number of points in the bottom window *does* change **Zoom Span** and does *not* change the number of points in the top window, because the more points you show in the bottom window, the greater is the percentage of the top window which you are showing in the bottom.

Two functions in **Trace Zoom** depend on which window is selected (the selected window has a thick green border around it). When the **Zoom Window** (bottom window) is selected, the "Points" on page 499 control in the **Sweep** menu changes to **Zoom Points**, and adjusts the number of points in the bottom window. Also, for all **Peak Search** functions, if the bottom window is selected, the search function operates *only* within that window. This allows you to perform a **Peak Search** over a specified, limited frequency range, while still viewing the larger frequency range in the top window.

NOTE: If you have just switched to the **Zoom Window** via SCPI (using `:DISP:WIND`) you should wait at least one second before performing a **Peak Search**, to ensure that SCPI will direct the **Peak Search** command to the correct window.

When you are in **Zero Span** in **Trace Zoom**, both the top and bottom window are in **Zero Span**, but the bottom window has a different sweep time reflecting how much it is zoomed. When you switch between **Swept Span** and **Zero Span** (either direction), the blue bar in the top window remains fixed in position and size, and the number of points in the top window does not change. So, on the **Swept Span** to **Zero Span** transition, this determines the number of points in the bottom window.

Transition Rules

When you enter the **Trace Zoom** view, the top window takes on all of the traces, markers and settings that were present in the **Normal** view. **Zoom Center** is the same as the instrument **Center Frequency**, and **Zoom Span** is 10 % of the instrument **Span**. When you leave the **Trace Zoom** View, the top window traces and settings carry over to the next view.

When you enter the **Trace Zoom** view, the focus is always in the zoom window. To change the focus (switch between windows), tap another window. The window that has the focus is distinguished by a blue border.

3.2.2.4 Waterfall

Window #4

This window is an important component of the **Spectrogram** View. The **Waterfall** window shows a history of the last 1000 traces, and the **Spectrum** window shows the trace indicated by "Display Trace" on page 257 in the **Display** menu.

Waterfall is on by default in the **Spectrogram** View. If you add the **Waterfall** window using the Window Data dropdown, the color bar appears in the **Spectrum** window.

Views in which the **Waterfall** window appears:

View	Size	Position
"Spectrogram" on page 186	Half height, full width	Bottom

Note that since the spectrogram is intended to give a view of spectral behavior versus time, the **Periodic** Trigger, which generates triggers at known intervals, provides the most predictable and consistent starting times for the traces. Other triggers, like **Free Run** or **External**, may give non-linear or less predictable times. Similarly, turning **Auto Align** off improves the regularity of the trace starting times.

Display Trace

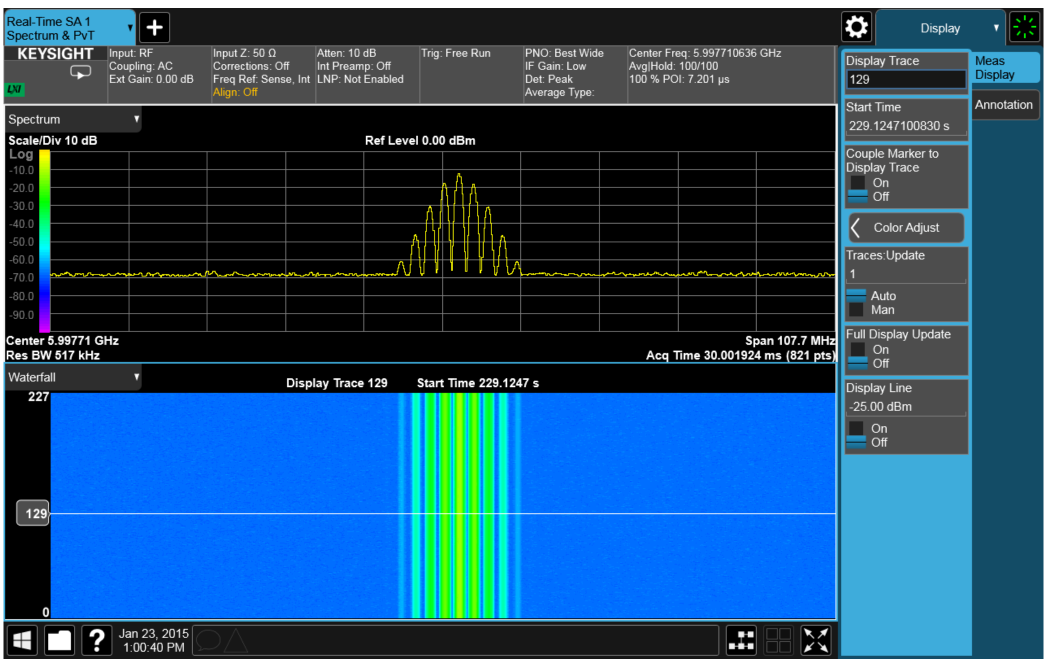
The **Display Trace** control determines which of the traces in the **Waterfall** (usually the lower) window is currently being viewed in the **Spectrum** (usually the top) window. A white line across the **Waterfall** window shows the current position of the **Display Trace**. On entry to the **Spectrogram** View, **Display Trace** has a value of 0; which means it is set to the “live” trace.

The “live” trace does not appear in the **Waterfall** window; **Display Trace 1** is the bottommost trace in the **Waterfall** window. Every time a sweep completes, the data from **Display Trace 0** is moved to **Display Trace 1**, and all the other traces “roll up.” Once the trace data has been written into the spectrogram, it is immutable.

Although all 6 traces can be used in the trace window, it is the data from the “live” Trace 1 that goes into **Display Trace 0** and then into the **Waterfall** window. Thus, the spectrogram represents the history of Trace 1; traces 2-6, although available, are not written into the spectrogram. As you change the value of **Display Trace**, you see the historical data only in Trace 1; Traces 2-6 still represent live data.

The **Waterfall** window itself can only hold 300 traces with the windows sized normally. Since the Spectrogram memory can hold 1000 traces, this means that often, many traces are off-screen above or below the **Waterfall** window. The oldest trace is the topmost trace. The value of **Display Trace** is annunciated at the top of the **Waterfall** window, along with the start time of that trace. You can tap the **Display Trace** annunciator to enter a value for **Display Trace**.

The display trace also has a handle that sticks out on the left and contains the display trace number. You can drag the display trace with this handle. The handle outline is white, like the display trace. The display trace top and bottom is annotated on the left side of the waterfall as in the figure below.



If the display trace is offscreen above, the handle outline is yellow, and the white line becomes a dashed yellow line.

The waterfall can be scrolled up and down with your finger (hint: this works best if you are in **Single**). Markers on the Waterfall can be dragged left, right, up or down to any position on the waterfall.

Any variable change that restarts a sweep clears out the spectrogram and start it over, unless you are in the idle state (**Single** sweep or waiting for a trigger), in which case it is cleared out when you start sweeping again. **Restart** clears out all spectrogram traces and start over. The **Waterfall** display is also cleared on exit from the **Spectrogram** View, so every time you enter the **Spectrogram** View, the **Waterfall** window is empty.

The colors in the Spectrogram represent signal amplitude. The key to these colors is displayed next to the Y Axis in the upper window. By changing the Y Axis parameters, you can change the scaling; that is, by changing the **Reference Level** or **Scale/Div**, the colors remap to new Amplitude values. Note that this does not restart the Spectrogram, unless "Attenuation" on page 1932 changes.

As this is swept spectrum analysis, each horizontal line in the **Waterfall** window represents a single trace, and the vertical axis represents time. You might thus expect each line to slope upwards from left to right to more correctly represent the point in time at which each point in the trace was taken. However, the lines are horizontal, so the display represents each trace as representing a single time, which is in fact its start time. If this distinction is important to you, use FFT sweeps (with an **FFT Width** greater than your span, of course) to ensure that each trace point in a line better represents the same moment in time.

If **Display Trace** = 0, the data for Trace 1 is written into the trace as the data is acquired, just as in **Normal** view. So, you see the data as it is acquired; for a slow sweep, for example, you see the trace fill as the points are taken. For any other value of **Display Trace**, Trace 1 appears static, as it represents an historical trace. As the traces roll up, the value of **Display Trace** does not change, so you see a different trace in Trace 1 every time the live trace finishes. To freeze the spectrogram, put Trace 1 into View, or put the instrument into **Single** sweep (note that unless **Average/Hold Number** = 1, putting the instrument into **Single** does not freeze the Spectrogram until the number of traces specified by **Average/Hold Number** have been taken).

When returning to the **Normal** view from the **Spectrogram** view, Trace 1 holds whatever data was in **Display Trace 0** on exit.

Differences with Spectrum window

While in **Spectrogram** View, all functions and settings work as normal, except as noted below.

- The **Single** key behaves differently than it does in **Normal** view. In the **Spectrogram** View, **Single** causes a specified number of traces to be read into the spectrogram from Trace 1, after which the acquisition stops. The number of traces to be read into the spectrogram is controlled by "Average/Hold Number" on page 379 in the **Meas Setup** menu. For example, if you set **Average/Hold Number** to 5, then every time you press **Single**, it takes 5 sweeps and puts the 5 traces one by one into the Spectrogram; then it stops sweeping. Note that you can set **Average/Hold Number** to 1 to capture a single trace into the

Spectrogram when **Single** is pressed, making the behavior similar to that of the **Normal** view

- In **Spectrogram** View, Sweep **Points** are limited to a maximum of 1001 due to memory concerns. On entry to this view, if the number of points is greater than 1001, it is forced to 1001; therefore, if you had a larger number of points on entry to **Spectrogram**, all the traces from the **Normal** view are cleared out
- In **Spectrogram** View, if Trace 1 is saved, exported or queried, the data that gets saved or returned is the data from the **Display Trace** in the spectrogram. All SCPI trace saves or queries for the other 5 traces return their data normally
- Trace Copy is available in **Spectrogram**. If Trace 1 is the “from” trace, **Copy** Trace copies the **Display Trace** to any other trace. **Display Trace** is one of up to 10000 historical versions of Trace 1, so, if the **Display Trace** is 150, then the 150th version of Trace 1 is copied to the destination trace. Since the historical trace data is immutable, copying a trace to Trace 1 is not possible. The same is true for Trace "Exchange" on page 1733; Trace 1 is not available to exchange
- Selecting or moving a marker that is turned on but not on the current **Display Trace** does *not* move the marker to the current **Display Trace**; it selects it, and/or moves it, but it stays on the Trace it is currently on
- Turning on a marker that is turned off turns it on in the center of the current **Display Trace**
- When a **Peak Search** is performed, if the selected marker is turned on but is not on the current **Display Trace**, it is first moved to the center of the current **Display Trace** before performing the search
- If **Couple Markers** is **On**, then moving a marker to a new **Display Trace** causes all the coupled markers to move by the same number of traces

NOTE

`:INIT` works in a slightly different fashion in the **Spectrogram** view. In the other views, the following two commands perform exactly the same function:

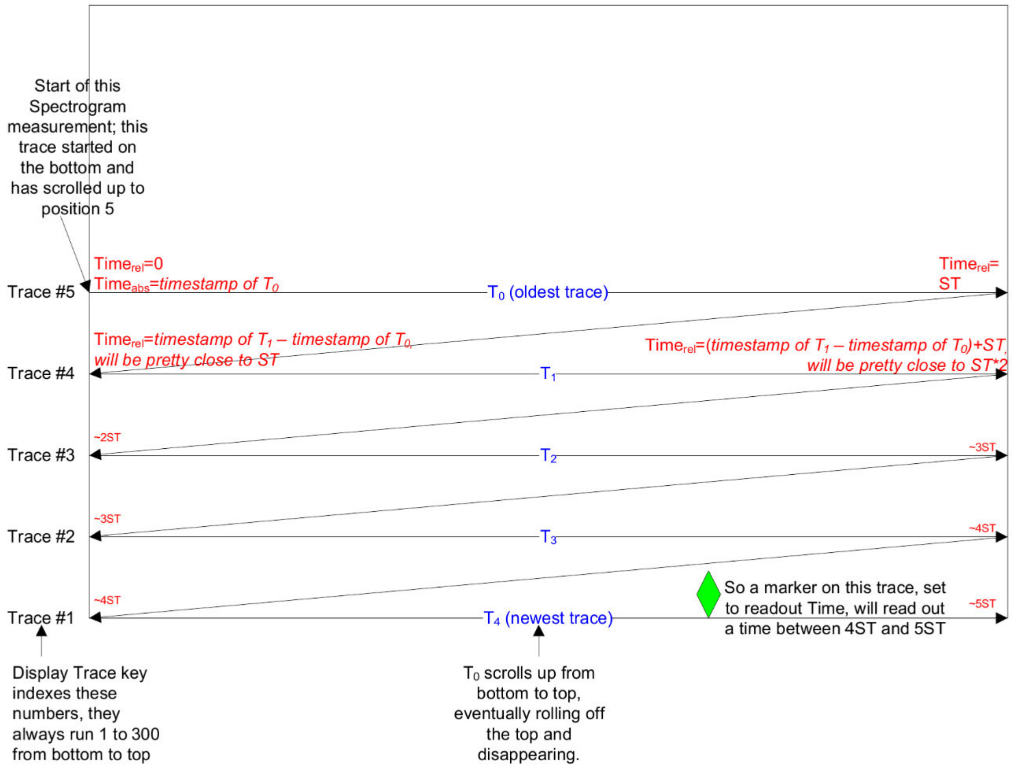
`:INITiate:RESTart`

`:INITiate:IMMediate`

However, in **Spectrogram** View, `:INITiate:RESTart` works like the **Restart** key, and clears out the Spectrogram trace history. `:INITiate:IMMediate` does not clear out the Spectrogram trace history but performs all other functions of performing a restart.

Representation of Time

In **Spectrogram** view, zero time is the point where the first trace started, meaning that each subsequent trace point is at a positive time that represents when that point was gathered, relative to the start point. Each trace is time stamped as it starts, and this time is remembered for each trace. As successive traces appear their start times get successively larger, relative to the start time of the oldest trace. If a marker is placed on the live trace and its readout is set to **Time**, the time of this marker will increment by about the sweep time for every new sweep. See the diagram below for a graphical representation of how this appears:



Each trace point has a time value; the value of the start time of the trace is accurately time stamped, but each point within the trace is the start value plus the proportion of sweep time represented by that position in the trace. This means the time value of the points within a trace is not as accurate as the start point, which is actually the case even in the **Normal** view, when you use a **Time** readout for markers in the frequency domain. This problem is particularly acute with "Sweep Type" on page 490 set to **FFT**, since the calculated nominal FFT sweep time estimate can be off by a large percentage. Therefore, in FFT sweeps, to prevent overlaps of time on traces, and to make **Sweep Type FFT** consistent with **Swept**, the end time for each trace is calculated to yield a continuous functional Z axis time value for each position on the trace. Since any inaccuracies within each trace are therefore reconciled with the start of the next sweep, you can consider the time values along a trace to be accurate enough for the purpose of making delta time measurements between traces.

`:TRACe:DISPlay:VIEW:SPECtrogram:TIME?` can be used to retrieve the time that the current trace in the spectrogram started.

Markers in Spectrogram

In **Spectrogram** View, you can put markers on any trace in the **Waterfall** window. To put a marker on a particular trace in the **Waterfall** window, set **Display Trace** to the trace upon which you want the marker, then position the marker as desired on Trace 1 in the trace window. When you turn a marker on, or do any kind of **Peak Search**, if the marker is a Trace 1 Marker, it appears on the current **Display Trace**. Then when you move the **Display Trace** to other traces in the **Waterfall** window, the marker stays on the **Waterfall** trace it is on.

Markers are displayed in the **Waterfall** window as little crosses, with one bar sitting on the trace in question and the other bar perpendicular to it. The selected marker's cross is green; the others are white.

You can right-click or touch-and-hold on the spectrogram to get a menu of functions including:

- Peak Search
- Peak Search all Traces
- Move Marker n here (n=whichever marker is selected)
- Add Marker Here

There are also two useful functions in the **Marker ->** menu:

- Move Marker -> Display Trace
- Move Display Trace -> Marker

Example

Set **Display Trace** to spectrogram trace number 125. Turn on **Marker 1**. Marker 1 appears on Trace 1, which is spectrogram trace number 125. A green diamond appears on trace 1 in the trace window, and a little cross appears on spectrogram trace number 125 in the **Waterfall** window. Now set **Display Trace** to 200. The trace window now shows spectrogram trace number 200; **Marker 1** disappears from that window because it is still on spectrogram trace number 125. You can still see the little cross sitting on spectrogram trace number 125 in the **Waterfall** window.

The selected marker displays in the upper right corner of the top window display, as always. If a **Delta** marker is referenced to a marker on another Spectrogram Trace, then when the Marker X-Axis Scale is **Time**, you see the delta that represents the Y-axis delta between the two markers, as always; but in this case the X-axis delta now includes the time between the two traces.

When you leave **Spectrogram** View, all Trace 1 Markers that were not on **Display Trace 0** are turned `OFF`.

3.2.2.5 Marker Table

Window #5

Displays a table containing detailed information about all of the markers in the current measurement. There is no specific view in which the **Marker Table** window turns on, it is on by demand.

Marker Table is turned on or off by "Marker Table" on page 316 in the **Marker** menu, or it can be selected from the Data control on the Window Title dropdown. Turning **Marker Table** on with the **Marker Table** switch does not modify the current view the way changing an existing window or adding a window does; it does not create a starred (modified) view, it merely adds the **Marker Table** window and shows *no* view as selected in the **View** menu.

Note that turning on **Marker Table** with the **Marker Table** switch turns off any of the other switched windows (**Peak Table**, **Gate**, **Measure at Marker**). Also note that the **Marker Table** switch is unavailable in all views except **Normal**; in that case you must use the Window Data dropdown to add a **Marker Table** window. (Although grayed-out, the switches display correctly, for example, the **Marker Table** switch shows **On** if a **Marker Table** window is on.)

Note that when you are in one of these “switched” views, you cannot create a **User View**; the **Edit View** icon is grayed-out. Note also that when you exit one of these “switched” views, you are not prompted to save the starred view, because it does not create a starred view; nor are you prompted to save the view when you leave the current measurement; and when you return to that measurement, the switch is on and just adds the window again.

3.2.2.6 Peak Table

Window #6

Provides a displayed list of up to 500 signal peaks from the selected trace. The maximum number of peaks listed in the peak table can be set by "Maximum Number of Peaks" on page 331. There is no specific view in which the **Peak Table** window turns on, it is on by demand.

Peak Table is turned on or off by "Peak Table On/Off" on page 329 in the **Marker** menu, or can be selected from the Data control on the **Window Title** dropdown. Turning **Peak Table** on with the **Peak Table** switch does not modify the current view the way changing an existing window or adding a window does; it does not create a starred (modified) view, it merely adds the **Peak Table** window and shows *no* view as selected in the **View** menu.

Note that turning on **Peak Table** with the **Peak Table** switch turns off any of the other switched windows (**Marker Table**, **Gate**, **Measure at Marker**). Also note that the **Peak Table** switch is unavailable in all views except **Normal**; in that case you have to use the **Window Title** dropdown to add a **Peak Table** window. (Although grayed-out, the switches display correctly, for example, the **Peak Table** switch shows **On** if a **Peak Table** window is on.)

Note that when you are in one of these "switched" views, you cannot create a **User View**; the **Edit View** icon is grayed-out. Note also that when you exit one of these "switched" views, you are not prompted to save the starred view, because it does not create a starred view; nor are you prompted to save the view when you leave the current measurement; and when you return to that measurement, the switch is on and just adds the window again.

3.2.2.7 Measure at Marker

Window #7

Executing "Measure at Marker" on page 360 turns on the **Measure at Marker Window**. It can be turned off by "Measure at Marker Window On/Off" on page 365. There is no specific view in which the **Measure at Marker** window turns on, it is on by demand.

Besides being turned on or off with controls under **Marker Function**, the **Measure at Marker** result can be selected from the Data control on the Window Title dropdown. Turning the **Measure at Marker** window on by executing **Measure at Marker** does not modify the current view the way changing an existing window or adding a window does; it does not create a starred (modified) view, it merely adds the **Measure at Marker** window and shows *no* view as selected in the **View** menu.

Note that **Measure at Marker** turns off any of the other switched windows (**Marker Table**, **Peak Table**, **Gate**). Also note that the **Measure at Marker** switch is unavailable in all views except **Normal**.

Note that when you are in one of these "switched" views, you cannot create a **User View**; the **Edit View** icon is grayed-out. Note also that when you exit one of these "switched" views, you are not prompted to save the starred view, because it does not create a starred view; nor are you prompted to save the view when you leave the current measurement; and when you return to that measurement, the switch is on and just adds the window again.

3.2.2.8 Gate

Window #8

Turning on **Gate** View shows the split-screen **Gate** View, with a **Spectrum** window on the top and a **Gate** window on the bottom.

Views in which the **Gate** window appears:

View	Size	Position
"Gate View On/Off" on page 2665	Half height, full width	Bottom

The **Gate** window is turned on or off by "Gate View On/Off" on page 2665 in the **Trigger** menu, or it can be selected from the Data control on the Window Title dropdown. Turning the **Gate** window on with the **Gate** View switch does not modify the current view the way changing an existing window or adding a window does; it does not create a starred (modified) view, it merely adds the **Gate** window and shows *no* view as selected in the **View** menu.

Note that turning on the **Gate** window with the **Gate** View switch turns off any of the other switched windows (**Marker Table**, **Peak Table**, **Measure at Marker**). Also note that **Gate** View is unavailable in all views except **Normal**.

Note that when you are in one of these "switched" views, you cannot create a **User View**; the **Edit View** icon is grayed-out. Note also that when you exit one of these "switched" views, you are not prompted to save the starred view, because it does not create a starred view; nor are you prompted to save the view when you leave the current measurement; and when you return to that measurement, the switch is on and just adds the window again.

3.2.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.2.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Reference Level

Specifies the amplitude represented by the topmost graticule line.

In this measurement, changing the reference level does not restart a measurement, because it is a display function only. Instead, it vertically 'pans' all displayed traces and markers to the new value. If a change to the reference level changes the attenuation value (for example, via an auto coupling), then the measurement is restarted.

See "Amplitude Representations" on page 201

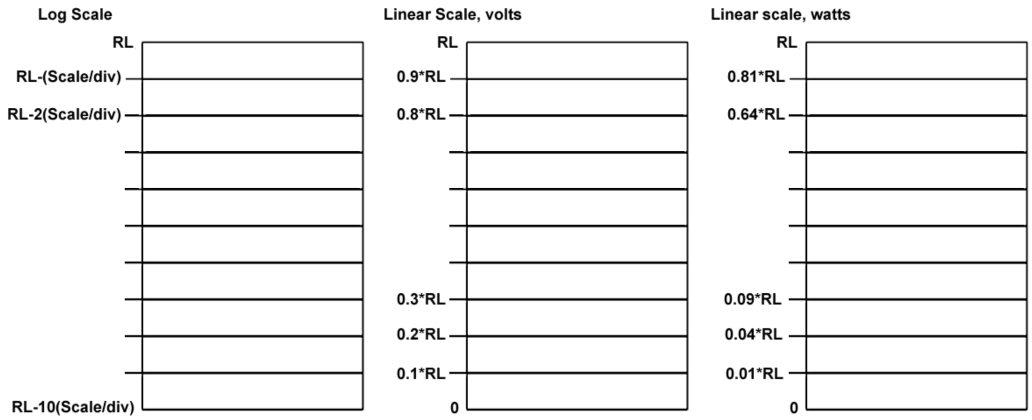
Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	Set the reference level to 20 dBm, which displays in the current Y axis unit. For example, if the Y axis unit is dBmV, then 126.99 dBmV is displayed: `:DISP:WIND:TRAC:Y:RLEV 20 dBm`
Couplings	If you reduce the attenuation, the instrument may have to lower the reference level to keep it below its allowed maximum. This allowed maximum level is specified in the “Max” row, below, along with other variables that affect it When you increase attenuation, the reference level does not change Note that there is *no* coupling in N9042B
Preset	0 dBm
State Saved	Saved in instrument state
Min/Max	The minimum Ref Level is -170 dBm + RefLevelOffset - ExtGain The maximum Ref Level is typically: N9042B: +250, Note this value does not change EXA (except N9010N), CXA and CXA-m: +23 dBm + RL Offset – External Gain VXT model M9421A: +33 dBm + RL Offset – External Gain VXT models M9410A/11A/15A: +30 dBm + RL Offset – External Gain M8920A: Ant Port: +30 dBm + RL Offset – External Gain; T/R Port, Low Power Mode: +33 dBm + RL Offset – External Gain; T/R Port, High Power Mode: +47 dBm + RL Offset – External Gain All other models: +30 dBm + RL Offset – External Gain The maximum may be further limited by the current value of other parameters, including Mech Atten, Int Preamp Gain, Swept IF Gain, FFT IF Gain, Max Mixer Level, and the total attenuation currently available. This maximum value is determined by the maximum power that can be safely applied to the input circuitry Note that the maximum reference level is unaffected by the input choice of external mixing
Annotation	The reference level is displayed above and to the left of the graticule with the title “Ref”

Nested Min/Max table:

N9042B	+250, Note this value does not change
EXA (except N9010N), CXA and CXA-m	+23 dBm + RL Offset – External Gain
VXT model M9421A	+33 dBm + RL Offset – External Gain
VXT models M9410A/11A/15A	+30 dBm + RL Offset – External Gain
M8920A	Ant Port: +30 dBm + RL Offset – External Gain T/R Port, Low Power Mode: +33 dBm + RL Offset – External Gain T/R Port, High Power Mode: +47 dBm + RL Offset – External Gain
All other models	+30 dBm + RL Offset – External Gain

Amplitude Representations

The following is an illustration of the reference level and Y-Axis scales under various conditions:



Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule divisions in the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

In measurements that support both `LOG` and `LIN` settings for "Display Scale" on page 203, this function is only available when **Display Scale (Log)** is selected, and the vertical scale is power. When **Display Scale (Lin)** is selected, **Scale/Div** is grayed-out.

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:WIND:TRAC:Y:PDIV 5 DB` `:DISP:WIND:TRAC:Y:PDIV?`
Dependencies	In measurements that support both `LOG` and `LIN`**Display Scales**, **Scale/Div** is grayed-out in linear Y scale. Sending the equivalent SCPI command does change **Scale/Div**, though it has no affect while in `LIN`
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	All measurements unless noted: <value> dB/ left upper of graph

In log scale, the Scale/Div is shown in the upper left side of the display. In Lin mode, no annotation is displayed

Display Scale

Selects a linear or logarithmic vertical scale for the display and for remote data readout:

`LOGarithmic`	The vertical graticule divisions are scaled in logarithmic units. The top line of the graticule is the Reference Level, and the Scale/Div value is used to assign values to the other locations on the graticule
`LINear`	The vertical graticule divisions are linearly scaled with the reference level value at the top of the display and zero volts at the bottom. Each vertical division of the graticule represents one-tenth of the Reference Level

NOTE The Y Axis Unit used for each type of display is set by pressing **Y Axis Unit**. The instrument retains separate **Y Axis Unit** settings for both Log and Lin.

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:SPACing LINear | LOGarithmic` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:SPACing?`
Example	`:DISP:WIND:TRAC:Y:SPAC LOG` `:DISP:WIND:TRAC:Y:SPAC?`
Dependencies	If "Normalize" on page 537 is ON, **Display Scale** is forced to LOG and is grayed-out
Couplings	Changing **Display Scale** always sets **Y Axis Unit** to the last unit specified for the current amplitude scale
Preset	LOG
State Saved	Saved in instrument state
Annotation	Log or Lin appears to the left of the graticule below the reference level

Y Axis Unit

Displays a dropdown menu that enables you to change the vertical (Y) axis amplitude unit. This setting affects how the data is read over the remote interface. When using the remote interface, only numerical values are returned, so you must know what the Y Axis Unit is to interpret the results. This is described in more detail in "Amplitude Data Query and Y Axis Unit" on page 206 below.

For measurements that support both Log and Lin scales, the instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales. For example, if Display Scale has been set to Log, and you set Y Axis Unit to dBm, pressing **Display Scale (Log)** sets the Y Axis Unit to dBm. If Display Scale has been set to Lin and you set Y Axis Unit to V, pressing **Display Scale (Lin)** sets the Y Axis Unit to V. Pressing **Display Scale (Log)** again sets the Y Axis Unit back to dBm.

If an Amplitude Correction is being applied that has an associated Transducer Unit, all selections but **Xducer Unit** are grayed-out. For more information, see "Transducer Unit" on page 207 below.

Remote Command	`:UNIT:POWer DBM | DBMV | DBMA | V | W | A | DBUV | DBUA | DBPW | DBUVM | DBUAM | DBPT | DBG` `:UNIT:POWer?`

Example	`:UNIT:POW dBmV`
	`:UNIT:POW?`
	See also "Remote Interface Examples" on page 205 below

Notes	The Y axis unit has either logarithmic or linear characteristics. The set of units that is logarithmic consists of dBm, dBmV, dBmA, dBmV, dBmA, dBmV/m, dBmA/m, dBpT, and dBG. The set of units that are linear consists of V, W, and A. The chosen unit will determine how the reference level and all the amplitude-related outputs like trace data, marker data, etc., read out
Dependencies	Appears only in Spectrum Analyzer Mode If an amplitude correction with a Transducer Unit other than None is applied and enabled: – The Transducer Unit selection is forced, and is the only Y Axis Unit available. The specific Transducer Unit is shown in square brackets in the dropdown, and all other Y Axis Unit choices are grayed-out – If you turn off that correction or set Apply Corrections to NO, the Y Axis Unit that existed before the Transducer Unit was applied is restored When Normalize is ON (in the **Trace**, **Normalize** menu), Y Axis Unit is grayed-out, and forced to dBm
Couplings	The instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales
Preset	dBm for log scale, V for linear. The true 'preset' value is dBm, since at preset the Y Display Scale is set to logarithmic
State Saved	Saved in instrument state
Annotation	The Y Axis Unit is shown after Ref Level value at the top of the graticule

Unit	Example	Notes
dBm	`:UNIT:POW DBM`	Y Axis Unit is set to dBm
dBmV	`:UNIT:POW DBMV`	Y Axis Unit is set to dBmV
dBmA	`:UNIT:POW DBMA`	Y Axis Unit is set to dBmA
W	`:UNIT:POW W`	Y Axis Unit is set to W
V	`:UNIT:POW V`	Y Axis Unit is set to V
A	`:UNIT:POW A`	Y Axis Unit is set to A
dBmV	`:UNIT:POW`	Y Axis Unit is set to dBmV

Unit	Example	Notes
	DBUV	
dBmA	:UNIT:POW DBUA	Y Axis Unit is dBmA. The unit dBuA can also appear as a Transducer Unit
dBpW	:UNIT:POW DBPW	Y Axis Unit is set to dBpW

Remote Interface Examples

Command examples and details appear in the table below. Note that each of the commands below sets the amplitude unit only for the *selected* amplitude scale (Log or Lin), the other scale is unaffected.

Unit	Example	Notes
dBm	:UNIT:POW DBM	dB relative to one milliwatt
dBmV	:UNIT:POW DBMV	dB relative to one millivolt
dBmA	:UNIT:POW DBMA	dB relative to one milliamp
W	:UNIT:POW W	Watts
V	:UNIT:POW V	Volts
A	:UNIT:POW A	Amperes
dBmV	:UNIT:POW DBUV	dB relative to one microvolt
dBmA	:UNIT:POW DBUA	dB relative to one microamp The unit dBuA can also appear as a "Transducer Unit" on page 207 When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA transducer unit. If :CORR:CSET:ANT? returns NOC (for No Conversion), you are using a normal Y Axis dBuA. If it returns UA, you are using a Transducer Unit dBuA
dBpW	:UNIT:POW DBPW	dB relative to one picowatt
dBmV/m (Transducer Unit)	:UNIT:POW DBUVM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmV/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 207
dBmA/m (Transducer Unit)	:UNIT:POW DBUAM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 207
dBpT (Transducer Unit)	:UNIT:POW DBPT	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBpT (dB relative to one picotesla). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None

Unit	Example	Notes
		See "Transducer Unit" on page 207
dBG (Transducer Unit)	:UNIT:POW DBG	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBG (dB relative to one Gauss). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 207
dBmA (Transducer Unit)	:UNIT:POW DBUA	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA. This selection is only available as a Transducer Unit if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 207 The unit dBuA can also appear as a normal Y Axis Unit (see above) dBuA as a Transducer Unit is used when using current probes, because current probes are often supplied with conversion tables that provide the transducer factors. When dBuA is used as a Transducer Unit, the normal conversion from power to amps for dBuA (based on the instrument input impedance) is not done, but instead the conversion is based solely on the Correction that contains the transducer factors. This is what distinguishes dBuA as a normal unit from dBuA as a transducer unit When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA Transducer Unit. If :CORR:CSET:ANT? returns NOC (for No Conversion), you are using a normal Y-Axis dBuA. If it returns UA, you are using a Transducer Unit dBuA

Amplitude Data Query and Y Axis Unit

The settings of Y-Axis Unit and Display Scale affect how the data is returned over the remote interface in response to a query. When using the remote interface, no unit is returned, so you must know what the Y-Axis unit is to interpret the results:

Example 1

Set the following:

- Display Scale (Log)
- Y Axis Unit, dBm
- Scale/Div, 1 dB
- Ref Level, 10 dBm

This sets the top line to 10 dBm with each vertical division representing 1 dB. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 5 dBm and will read out remotely as 5.

Example 2

Set the following:

- Display Scale (Lin)
- Y Axis Unit, Volts
- Ref Level, 100 mV (10 mV/div)

This sets the top line to 100 mV and the bottom line to 0 V, so each vertical division represents 10 mV. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 50 mV and will read out remotely as 50.

NOTE **The units of current (A, dBmA, dBuA) are calculated based on 50 Ω input impedance.**

Transducer Unit

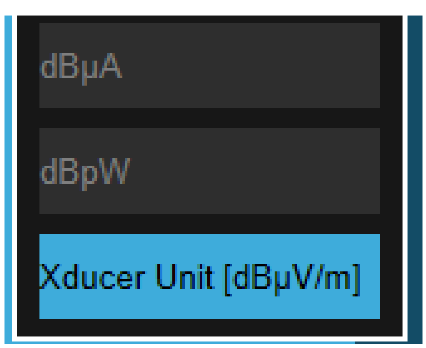
Transducer Units (formerly called Antenna Units) are units of field strength rather than amplitude, and are used when correcting the response of device such as antennas whose amplitude characteristics are measured in units of field strength. All five of the Transducer Units (dBmA/m, dBmV/m, dBG, dBpT, dBmA) are treated by the instrument exactly as though they were dBmV, when uncorrected. You must load an appropriate correction factor using Input/Output, Corrections for accurate and meaningful results.

If a remote command is sent to the instrument that uses one of the Transducer Units as a terminator, the instrument treats it as though DBUV had been sent as the terminator.

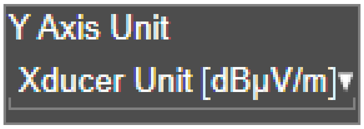
When a Correction is turned on that uses a Transducer Unit, the Y Axis Unit changes to that Transducer Unit. All of the selections in the **Y-Axis Unit** dropdown are then grayed-out, except the Transducer Unit selection. The unit being used is shown on this selection in square brackets, and appears on the control in square brackets preceded by **Xducer Unit**.

Example:

If the Transducer Unit in the Correction is dBmV/m, then the selection in the dropdown looks like this:



And on the control it looks like this:



NOTE

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output**, **Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output**, **Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

The Transducer Units are:

Units	Example
dBmV/m	:UNIT:POW DBUVM
dBmA/m	:UNIT:POW DBUAM
dBpT	:UNIT:POW DBPT
dBG	:UNIT:POW DBG
dBmA	:UNIT:POW DBUA
None	n/a

Reference Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off switch turns this function on and off. Setting a value for **Reference Level Offset** turns the function ON.

See "More Information" on page 209

Remote Command	:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet <rel_ampl> :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet?
Example	Set **Reference Level Offset** to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB is assumed: :DISP:WIND:TRAC:Y:RLEV:OFFS 12.7
Preset	0 dBm

State Saved	Saved in instrument state
Min	Variable Limited to values that keep the reference level within the range of -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as “Ref Offset <value>” to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown

Auto Function

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF | ON | 0 | 1` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?`
Example	Turn **Reference Level Offset** On: `:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON`
Preset	`OFF`

More Information

Offsets are used when gain or loss occurs between a device under test and the instrument input. Thus, the signal level measured by the instrument may be thought of as the level at the input of an external amplitude conversion device. Entering an offset does not affect the trace position or attenuation value, just the value of the top line of the display and the values represented by the trace data. Thus, the values of exported trace data, queried trace data, marker amplitudes, trace data used in calculations such as N dB points, trace math, peak threshold, and so forth, are all affected by Ref Level Offset.

NOTE **Changing the offset causes the instrument to immediately stop the current sweep and prepare to begin a new sweep, but the data will not change until the trace data updates, because the offset is applied to the data as it is taken. If a trace is exported with a nonzero Ref Level Offset, the exported data will contain the trace data with the offset applied.**

The maximum reference level available is dependent on the reference level offset. That is, **Reference Level** – **Reference Level Offset** must be in the range –170 to +30 dBm. For example, the reference level value range can be initially set to values from –170 dBm to 30 dBm with no **Reference Level Offset**. If the reference level is first set to –20 dBm, then **Reference Level Offset** can be set to values of –150 to +50 dB.

If **Reference Level Offset** is first set to –30 dB, then the reference level can be set to values of –200 dBm to 0 dBm. In this case, **Reference Level** is “clamped” at 0 dBm because the maximum limit of +30 dBm is reached with a reference level setting of 0 dBm with an offset of –30 dB. If instead, **Reference Level Offset** is first set to 30 dB, then **Reference Level** can be set to values of –140 to +60 dBm.

Number of Divisions

Lets you set the number of divisions vertically in the graticule. For example, set this to 12 to allow 120 dB of dynamic range with a scale of 10 dB/division.

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:NDIVision 6 | 8 | 10 | 12 | 16 | 20` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:NDIVision?`
Example	`:DISP:WIND:TRAC:Y:NDIV 12`
Preset	10
State Saved	Saved in instrument state

3.2.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 210
- See "Single-Attenuator Configuration" on page 211

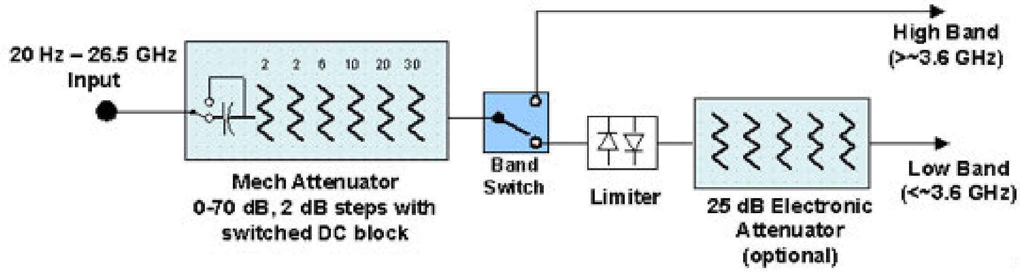
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9421A/10A/11A, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

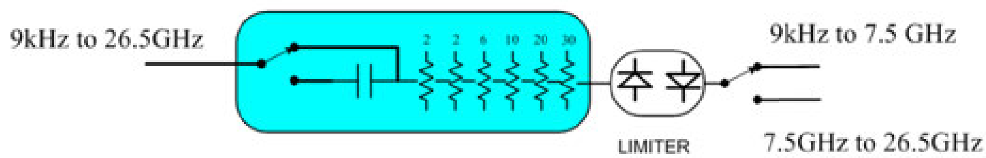
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

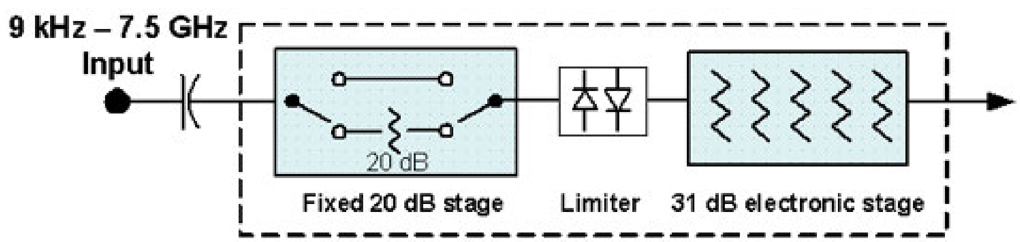


Configuration 2: Mechanical attenuator, no optional electronic attenuator

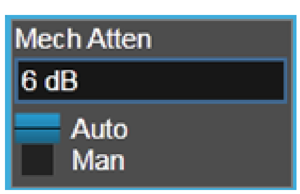


Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the "Dual-Attenuator" configuration.

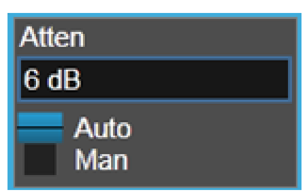
Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Dual Attenuator



Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 1935 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

	In the **Amplitude**, "Y Scale" on page 1929 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows: "Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 215

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

Dependencies	Some measurements do not support Auto setting of "Mech Atten" on page 213. In these measurements, the **Auto/Man** selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1937 See "Attenuator Configurations and Auto/Man" on page 215 for more information on the Auto/Man

	functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 213 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting will be changed to a multiple of 10 dB which will be no smaller than the previous setting. For example, 4 dB attenuation will be changed to 10 dB
Preset	The preset for Mech Attenuation is “Auto” The Auto value of attenuation is 10 dB `ON`
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example:

Dual-Attenuator configuration:

Atten: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB

Single-Attenuator configuration:

A: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)

When in Manual, a # sign appears in front of Atten in the annotation

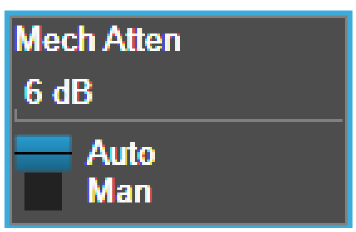
Attenuator Configurations and Auto/Man

As described under "Y Scale" on page 1929, there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 213 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation.

See "Elec Atten" on page 1937 for more about “soft” attenuation.

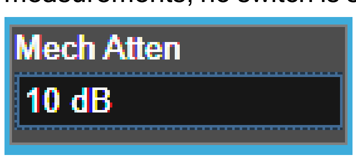
NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:



Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details about the Electronic Attenuator, see "More Information" on page 217

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation's specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 1959 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable

	If "LNA" on page 1960 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 217
Preset	0 dB OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 218 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1937

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-

Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting – (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB` `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "Max Mixer Lvl Rules" on page 1948.

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real>` `[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?`
Example	`:POW:MIX:RANG -15 dBm` `:POW:MIX:RANG?`
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

`NORMal`	The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the Reference Level is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression with be negligible
`TOI`	Allows a range of settings of the "Max Mixer Level" on page 1947, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
`COMPression`	Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive

levels that cause 1 dB or less compression at most carrier frequencies

Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMal	Normal – balance TOI, noise, and compression	–10	–50	0
TOI	TOI-limited dynamic range	–25	–50	–10
COMPression	Compression-limited dynamic range	–3	–10	+30

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal | TOI | COMPression` `[:SENSe]:POWer[:RF]:MIXer:RULEs?`
Example	`:POW:MIX:RULE:COMP`
Dependencies	Only appears in the Swept SA and RTSA measurements
Preset	`NORM`

3.2.3.3 Range (Non-attenuator models)

Only available for Keysight’s modular signal analyzers and certain other Keysight products, such as VXT

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`

Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

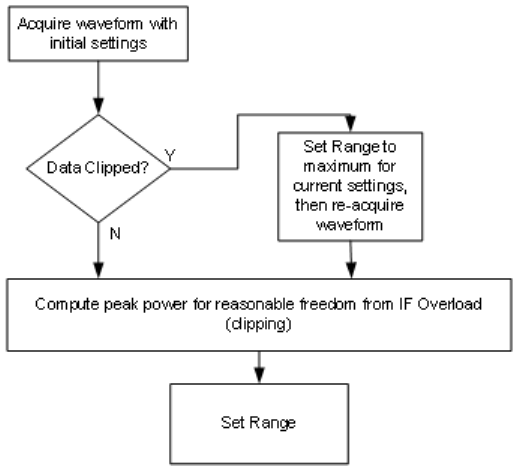
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1953 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	Does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1955. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.2.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9421A, or UXM.

This tab *does* appear in VXT Models M9410A/11A, because "Software Preselection" on page 1971 is under this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1958 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 225.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 1958
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 1956 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1956, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle

Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for Low Band, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, **N/A** is displayed in the square brackets for Low Band.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL`
	`[:SENSe]:POWer[:RF]:GAIN:BAND?`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW` `OFF`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1959. LNA provides lower system noise

figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

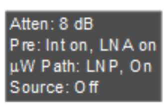
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 1959, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 229

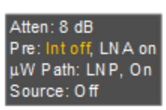
Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9421A/10A/11A May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	`OFF`
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to `ON`). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	`:POW:MW:PATH STD`	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	`:POW:MW:PATH LNP`	See "Low Noise Path Enable" on page 234
µW Preselector Bypass	`:POW:MW:PATH MPB`	See "µW Preselector Bypass" on page 236
Full Bypass Enable	`:POW:MW:PATH FULL`	See "Full Bypass Enable" on page 237

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL` `[:SENSe]:POWer[:RF]:MW:PATH?`

Example	`:POW:MW:PATH LNP`
	Enables the Low Noise path
	`:POW:MW:PATH?`

Notes	If "Presel Center" on page 1956 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A, nor in BBIQ and External Mixing – The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed – The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed – The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”
Preset	**Mode** / **Value** IQ Analyzer, Pulse, Avionics: MPB option present and licensed: `MPB`; MPB option not present and licensed: `STD` All other Modes: `STD`
State Saved	Save in instrument state
Range	Standard Path | Low Noise Path Enable | µW Presel Bypass | Full Bypass Enable
Annotation	In the Meas Bar, if the Standard path is chosen: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch *is* thrown: µW Path: LNP,On If the preselector is bypassed: µW Path: Bypass

If Full Bypass Enable is selected but the LNP switch is not thrown:

µW Path: FByp,Off

If Full Bypass Enable is selected and the LNP switch *is* thrown:

µW Path: FByp,On

µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Always Presel Bypass

Measurement	When µW Path Control is in Auto
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when ‘Enabled Wideband IF for FFT’ is OFF or ‘Sweep Type Rule’ is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass

Measurement	When µW Path Control is in Auto
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See the tables above
Preset	`ON`
Range	`ON|OFF`

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

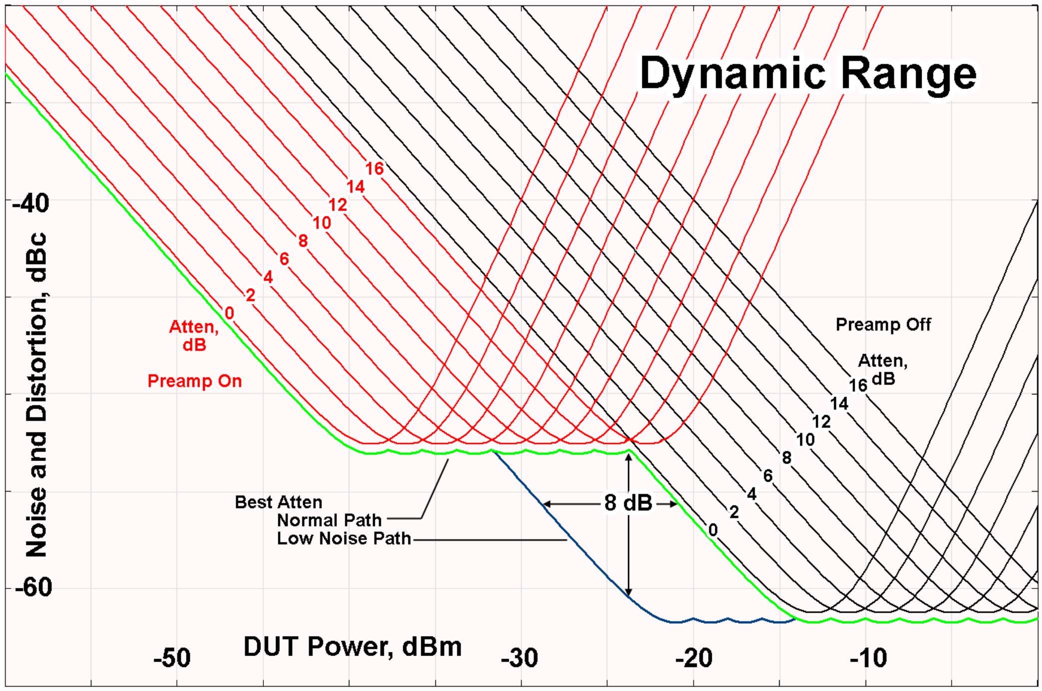
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the "Low Noise Path." However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION **When Full Bypass Enable is selected, and "Y Scale" on page 1929 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,**

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

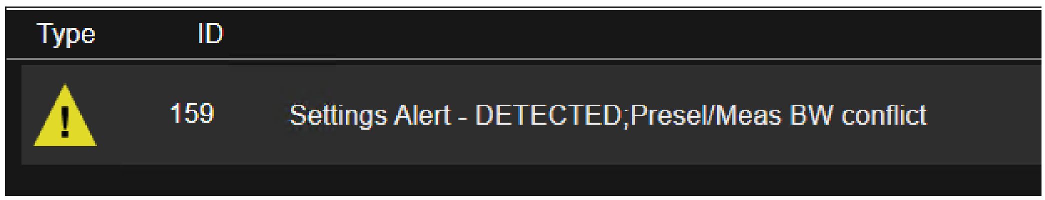
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

– There is some speed cost due to the need to take multiple captures

– Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

– `NORMal` - mathematically removes all image and multiple responses of signals present at the input

– `ADVanced` - any trace processing (such as "max hold" or trace averaging) is performed on the points of both candidate traces before the "select minimum" operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is `OFF`. The grayout message is "Unavailable unless SW Presel enabled"
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

– `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied

bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)

– NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is OFF. The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when **Software Preselection** is enabled
Preset	N9041B: NORMal N9042B+V3050A: NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in SA Mode:

	:SAN:PFIL ON
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See "Prefilter Presets" on page 243 below
State Saved	Saved in instrument state

EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.2.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The **Resolution BW** functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

NOTE The Average functions, which appeared in the **BW** menu in earlier instruments, can now be found in the **Trace** and **Meas Setup** menus.

In the **Trace** menu, you may turn **Trace Averaging** on or off for the desired traces (rather than globally as in the past).

In the **Meas Setup** menu, you may configure Averaging, by setting Average Number and Average Type.

3.2.4.1 Settings

This is the only tab in the BW menu.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument. Normally, Res BW (Auto) selects automatic coupling of the Res BW to Span using the ratio set by the Span:3 dB RBW control. To decouple the resolution bandwidth, press the Auto/Man toggle on the Res BW control, or simply enter a different value for Res BW.

When the Res BW is manually selected, it may be returned to the coupled state by pressing the Auto/Man toggle on the Res BW control. This may also be done by pressing "Auto Couple" on page 1995or by performing a Preset.

Normally the maximum Res BW is 8 MHz, but the Wide Bandwidths control lets you access a set of Resolution Bandwidths that are wider than the standard RBW's while in Zero Span. See "Wide Bandwidths" on page 255

See "More Information" on page 245

Remote Command	`[:SENSe]:BANDwidth|BWIDth[:RESolution] <freq>` `[:SENSe]:BANDwidth|BWIDth[:RESolution]?`
Example	`:BAND 1 KHZ` `:BAND?`
Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depends on the current bandwidth type
Dependencies	When in Zero Span with no EMI Standard selected, there is no Auto setting for Res BW. The Auto/Man toggle disappears in this case, and if `[:SENSe]:BWID[:RESolution]:AUTO ON` is sent, it generates an error message While using the Tracking Generator, you must make sure the Start Frequency is high enough to avoid capturing LO feedthrough in the trace. How high you must make the Start Frequency to avoid this depends on the Res BW you have set. The instrument displays a condition warning message if the Start Frequency falls below roughly 2.5 times the current RBW. The warning is "Source Uncal; adj

	Start Freq|RBW|Points". When you see this warning, you should increase the Start Freq, narrow the RBW, or increase the number of Sweep Points For CXA-m, if the requested setting of **Res BW** is less than 100 kHz in Tracking Source mode, a condition warning message is generated: 301, "Meas Uncal"
Couplings	**Res BW** is normally coupled to **Span**; if **Res BW** is set to **Auto**, as **Span** decreases, so does **Res BW**, to maintain the ratio set by the **Span:3 dB RBW** control (or 106:1 for measurements that do not have a **Span:3 dB RBW** control). In Zero Span, this coupling is normally turned off and **Res BW** has no **Auto** setting When a CISPR or MIL EMI Standard is in use, **Res BW** is coupled to "Center Frequency" on page 279 and not to "Span" on page 285, and this is true even in Zero Span
Preset	Auto (unless noted in the table below)
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW can actually exceed 8 MHz if using a filter other than –3 dB Gaussian When Option FS1 or FS2 is installed and the filter type is Gaussian, the max RBW is 10 MHz For VXT, max -3 dB RBW is limited to the current span or 8 MHz, whichever is smaller
Annotation	In the lower left corner of the screen, "RBW <(type)> <value>" will indicate the current setting of resolution bandwidth where <(type)> summarizes the filter type and bandwidth. <(type)> is not displayed for the –3 dB Filter Type A "#" mark appears before "RBW" in the annotation when it is switched from Auto to Manual coupling. Note that this # does NOT appear when in zero span with an EMC standard of None, as then there is neither an autocoupled nor a manual state in zero span; there is no coupling at all
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms

Auto Function

Remote Command	`[:SENSe]:BANDwidth|BWIDth[:RESolution]:AUTO OFF | ON | 0 | 1` `[:SENSe]:BANDwidth|BWIDth[:RESolution]:AUTO?`
Example	`:BWID:AUTO ON` `:BWID:AUTO?`
Preset	`ON`

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on "RBW Filter Type" on page 251

Only certain discrete resolution bandwidths are available. The available bandwidths depend on **RBW Filter Type** or **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

The zero-span case in the Swept SA measurement deserves some mention, because **Res BW** is coupled to **Span** when in a swept (non-zero) span and in zero span there is normally no meaningful **Res BW** coupling. However, when a MIL or CISPR EMC Standard is selected, there *is* a meaningful coupling for **Res BW** in Zero Span – in fact, it is coupled to **Center Frequency**, to make measurements according to the EMI specifications.

Video BW

Lets you change the instrument post-detection filter (VBW or "video bandwidth") from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

NOTE **An asterisk (*) is displayed next to the VBW annotation when certain detector types (Average, EMI Average, Quasi Peak, and RMS Average) are in use. This is because the VBW filter is out of the circuit for these detectors and does not affect any traces that use them. If there is any active trace using one of these detectors, * is displayed. See "Annotation Examples" on page 248.**

Normally, **Video BW (Auto)** selects automatic coupling of **Video BW** to **Res BW** using the ratio set by "VBW:3dB RBW" on page 248. To decouple the resolution bandwidth, press the **Auto/Man** toggle on **Video BW**, or simply enter a different value for **Video BW**.

When **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on **Video BW**. This may also be done by pressing "Auto Couple" on page 1995 or by performing a **Preset**.

Remote Command	`[:SENSe]:BANDwidth|BWIDth:VIDeo <freq>` `[:SENSe]:BANDwidth|BWIDth:VIDeo?`
Example	`:BAND:VID 1 KHZ` `:BAND:VID?`
Notes	For numeric entries, the instrument selects the nearest (arithmetically, on a linear scale, rounding up) available **Video BW** to the value entered. The 50 MHz VBW is defined to mean "wide open" The values shown in this table reflect the conditions after **Mode Preset**
Dependencies	Sometimes the displayed **Video BW** is not actually used to process the trace data: – When the **Average**"Detector" on page 518 is selected and **Sweep Type** is set to **Swept**, the video bandwidth filter cannot be used, because it uses the same hardware as the **Average Detector** – When the **Quasi-Peak**, **EMI Average**, or **RMS AverageDetector** is selected, **Video BW** is implemented by the digital IF as part of the detector When this is the case, **Video BW** still acts to change "Sweep Time" on page 479, if **Sweep Time** is in **Auto**, and still affects the data on other traces for which this is not the case

	In VXT, when in Zero Span, this control does not appear
Couplings	**Video BW** (VBW) is normally coupled to **Res BW**. If **VBW** is set to **Auto**, then **Video BW** changes as **Res BW** changes, to maintain the ratio set by **VBW:3 dB RBW** (usually 10:1 for measurements that do not have **VBW:3 dB RBW**)
Preset	Auto (unless noted in table below)
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A "#" mark appears before "VBW" in the annotation when it is not coupled
Annotation	In the bottom center of the screen, "VBW <value> <units>" indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms

Auto Function

Remote Command	`[:SENSe]:BANDwidth|BWIDth:VIDeo:AUTO OFF | ON | 0 | 1` `[:SENSe]:BANDwidth|BWIDth:VIDeo:AUTO?`
Example	`:BWID:VID:AUTO ON` `:BWID:VID:AUTO?`
Preset	`ON`

Video BW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

Measurement	Mode	Preset Value
Channel Power	WCDMA	2.40 MHz
Occupied BW	WCDMA	300 kHz
	BLUETOOTH	30 kHz
ACP	WCDMA	1 MHz
Monitor Spectrum	WLAN	1 MHz
	LTE, LTETDD, LTEAFDD, LTEATDD	1 MHz
TOI	SA	Determined by RBW

Annotation Examples

All active traces using VBW

One or more active traces not using VBW

VBW:3dB RBW

Selects the ratio between the video bandwidth and the equivalent 3 dB resolution bandwidth to be used for setting **Video BW** when VBW is in **Auto**.

VBW:3dB RBW (Auto) selects automatic coupling of the **Video BW**:3 dB **Res BW** ratio to "Detector" on page 518, using the rules described below in "Coupling Auto Rules" on page 249. To decouple the ratio, press the **Auto/Man** toggle on **VBW:3dB RBW**, or simply enter a different value for **VBW:3dB RBW**.

When **VBW:3dB RBW** is manually selected, it may be returned to the coupled state by setting the toggle on **VBW:3dB RBW** back to **Auto**. This may also be done by pressing "Auto Couple" on page 1995, or by performing a **Preset**.

Remote Command	`[:SENSe]:BANDwidth|BWIDth:VIDeo:RATio <real>` `[:SENSe]:BANDwidth|BWIDth:VIDeo:RATio?`
Example	`:BAND:VID:RAT 2` `:BAND:VID:RAT?`
Notes	The values shown in this table reflect the conditions after **Mode Preset**
Dependencies	In VXT, when in Zero Span, this control does not appear
Couplings	See "Coupling Auto Rules" on page 249
Preset	1
State Saved	Saved in instrument state
Min	0.00001
Max	3000000
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms

Auto Function

Remote Command	`[:SENSe]:BANDwidth|BWIDth:VIDeo:RATio:AUTO OFF | ON | 0 | 1` `[:SENSe]:BANDwidth|BWIDth:VIDeo:RATio:AUTO?`
Example	`:BAND:VID:RAT:AUTO 0` `:BAND:VID:RAT:AUTO?`
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:SFRequency:BWIDth:VIDeo:RATio:AUTO`

Coupling Auto Rules

The Auto Rules for the **VBW:3dB RBW** function are as follows.

First, if Source Mode is set to "Tracking": Use 1.0

Otherwise, go through the following list of detector numbers and find the lowest numbered detector being used on any active traces (traces for which **Update** is **On**):

1. Peak
2. Normal
3. Average
4. Sample
5. Negative Peak
6. EMI Average
7. Quasi Peak
8. RMS Average

Use that detector to pick the ratio based on the following criteria:

1. If the measurement supports EMC Standard, and the detector is Peak and the EMC Standard is set to either CISPR or MIL, use 10.0 (we use wide VBWs to capture peak levels accurately)
2. Otherwise, if the detector is **Negative Peak**, use 1.0 (in the Negative Peak case, there are no known significant use models, so we use a medium ratio)
3. Otherwise, if the detector is **Normal**, use 1.0
4. Otherwise, if the detector is **Average**, and the span is nonzero, use 0.1. The use of a small ratio in Average detection is desirable because of its effect on the sweep time equations. The VBW filter is not actually in-circuit when the average

detector is on. If the detector is Average, and the span is zero, use 10.0, which gives optimal behavior for Interval Markers in zero span. Note that only the Swept SA measurement supports Zero Span

5. Otherwise, if the detector is EMI Average, Quasi Peak or RMS Average, use 10.0. In fact, this is a "don't care" since no VBW is used for these detectors, as noted under "Dependencies" for the VBW control

6. Otherwise, the detector is simply **Peak** or **Sample**. These two detectors can use the same rules. In these cases, if any active trace is in max hold or min hold, use 10.0, because Max and Min Hold operations will usually be intended to capture peaks and pits without smoothing from the VBW filter; otherwise, use 1.0 as a compromise, because you have not set the instrument in a way that implies that you are measuring noise, pulsed-RF or CW signals, and for backward compatibility with earlier instruments

Note that because the above couplings depend on which traces are active, they are re-examined whenever any trace goes active or inactive, except when this leaves no traces active. Transitioning to the state where no traces are active should not affect the couplings; in that way, the annotation will always reflect the state of the last trace which was active.

Not also that some detectors are not available in some measurements, but because of the way the above rules that does not change the logic of the rules.

Span:3dB RBW

Selects the ratio between "Span" on page 285 and "Res BW" on page 244.

Normally, **Span:3dB RBW (Auto)** selects a **Span**: 3 dB **Res BW** ratio of 106:1. If you manually enter the ratio, the toggle on **Span:3dB RBW** changes to **Man.** This enables you to manually select ratios more suitable for certain measurements.

When **Span:3dB RBW** is manually selected, it may be returned to the coupled state by setting the toggle on **RBW:3 dB RBW** back to **Auto**. This may also be done by pressing "Auto Couple" on page 1995, or by performing a **Preset**.

Remote Command	`[:SENSe]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio <integer>` `[:SENSe]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio?`
Example	Set a ratio of 200:1, and turn off **Auto** coupling: `:FREQ:SPAN:BAND:RAT 200`
Notes	The values shown in this table reflect the conditions after **Mode Preset**
Dependencies	In the Swept SA measurement, this is grayed-out when the EMC Standard is set to CISPR or MIL, since **Res BW** is coupled to **Center Frequency** rather than **Span** in this case If the SCPI command is sent, the command is acted upon, but does not affect the current measurement

Preset	106
State Saved	Saved in instrument state
Min	2
Max	10000

Auto Function

Remote Command	[:SENSe]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio:AUTO OFF | ON | 0 | 1 [:SENSe]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio:AUTO?
Example	:FREQ:SPAN:BAND:RAT:AUTO ON :FREQ:SPAN:BAND:RAT:AUTO?

RBW Filter Type

Selects the type for the resolution bandwidth filters. In the X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI Example
Gaussian	:BAND:SHAP GAUS
Flattop	:BAND:SHAP FLAT

See "More Information" on page 252

Remote Command	[:SENSe]:BANDwidth|BWIDth:SHAPe GAUSsian | FLATtop [:SENSe]:BANDwidth|BWIDth:SHAPe?
Example	:BAND:SHAP GAUS :BAND:SHAP?
Notes	GAUSsian= Gaussian FLATtop = Flattop
Dependencies	In the Swept SA measurement, the **RBW Filter Type** control is grayed-out if the **EMC Standard** is set to **CISPR** or **MIL**. In this case the **Filter Type** is always Gaussian; the **Filter BW** is chosen as appropriate for the filter and the standard. Any attempt to set it to Flattop will give an error
Preset	"Auto Couple" on page 1995 selects the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this: –3 dB (Normal) filter BW: Res BW 300 Hz –6 dB filter BW: Res BW (–6 dB) 422 Hz Noise filter BW: Res BW (Noise) 317 Hz

Impulse filter BW	Res BW (Impulse) 444 Hz
CISPR filter BW	Res BW (CISPR) 200 Hz
MIL filter BW	Res BW (MIL) 1 kHz
Flattop filter type	Res BW (Flattop) 300 Hz

More Information

Gaussian filters

When the Gaussian filter type is chosen, a set of 160 RBW filters are available whose shape is approximately Gaussian. The actual bandwidths used to realize the X-Series' Gaussian filters are chosen to come as close as possible, within the limitations of the digital IF, to a 24 step per decade series from 1 Hz through 3 MHz, plus the 4, 5, 6 and 8 MHz settings.

For Gaussian filters, the annotation at the bottom of the screen shows the filter bandwidth type (unless it is Normal) parenthetically between the words “Res BW” and the value, for example:

Res BW 10.0 Hz	(Normal bandwidth)
Res BW (Impulse) 14.8 Hz	(Impulse bandwidth)

Flattop filters

When the Flattop filter type is chosen, a new set of 134 RBW hardware settings are available. These settings realize filters that are approximately rectangular in shape. When this shape is chosen the filter bandwidth options are irrelevant and therefore unavailable.

The annotation at the bottom of the screen shows that the Flattop shape is being used, for example:

Res BW (Flattop) 10 Hz

RBW Filter BW

Selects the type of filter bandwidth used to specify the width of the Gaussian RBW filters. Historically, the Gaussian Res BW filters in HP/Agilent/Keysight spectrum analyzers were specified using the –3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its –3 dB points 10 MHz apart. For certain types of applications, it can be useful to specify the filter width using points other than the –3 dB points. In the X-Series, the RBW Filter BW function allows you to pick the filter based on its –3 dB (Normal) bandwidth, its –6 dB bandwidth, its Noise bandwidth, or its Impulse bandwidth. Note that in all four cases the –3 dB bandwidth is the same. The filter does not change, but the way you specify it changes.

Example

Set **Res BW** to 1.0 kHz with **RBW Filter BW** set to **Normal**. Now, set **RBW Filter BW** to –6 dB. The bandwidth displayed for **Res BW** changes to 1.41 kHz. The shape and bandwidth of the filter have not changed, only the way the filter is annotated and the value that appears in the **Res BW** active function area have.

Filter BW	SCPI Example	Displayed bandwidth of a filter with 1 kHz -3 dB bandwidth
-3 dB (Normal)	:BAND:TYPE DB3	1.0 kHz
–6 dB	:BAND:TYPE DB6	1.41 kHz
Noise	:BAND:TYPE NOIS	1.06 kHz
Impulse	:BAND:TYPE IMP	1.48 kHz

See "More Information" on page 254

Remote Command	`[:SENSe]:BANDwidth|BWIDth:TYPE DB3 | DB6 | IMPulse | NOISe` `[:SENSe]:BANDwidth|BWIDth:TYPE?`
Example	`:BAND:TYPE NOIS` `:BAND:TYPE?`
Notes	`DB3` –3 dB (Normal) `DB6` –6 dB `IMPulse` Impulse `NOISe` Noise
Dependencies	Grayed-out and displays --- if the Flattop filter type is selected When **EMC Standard** is set to **CISPR** or **MIL**, the **RBW Filter BW** control is grayed-out. This is because **RBW Filter BW** is selected as appropriate for the filter and the standard, and *not* selected by this control. Any attempt to set it otherwise generates an error
Preset	"Auto Couple" on page 1995 selects the preset value
State Saved	Saved in instrument state
Annotation	The annotation under **RBW** in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:

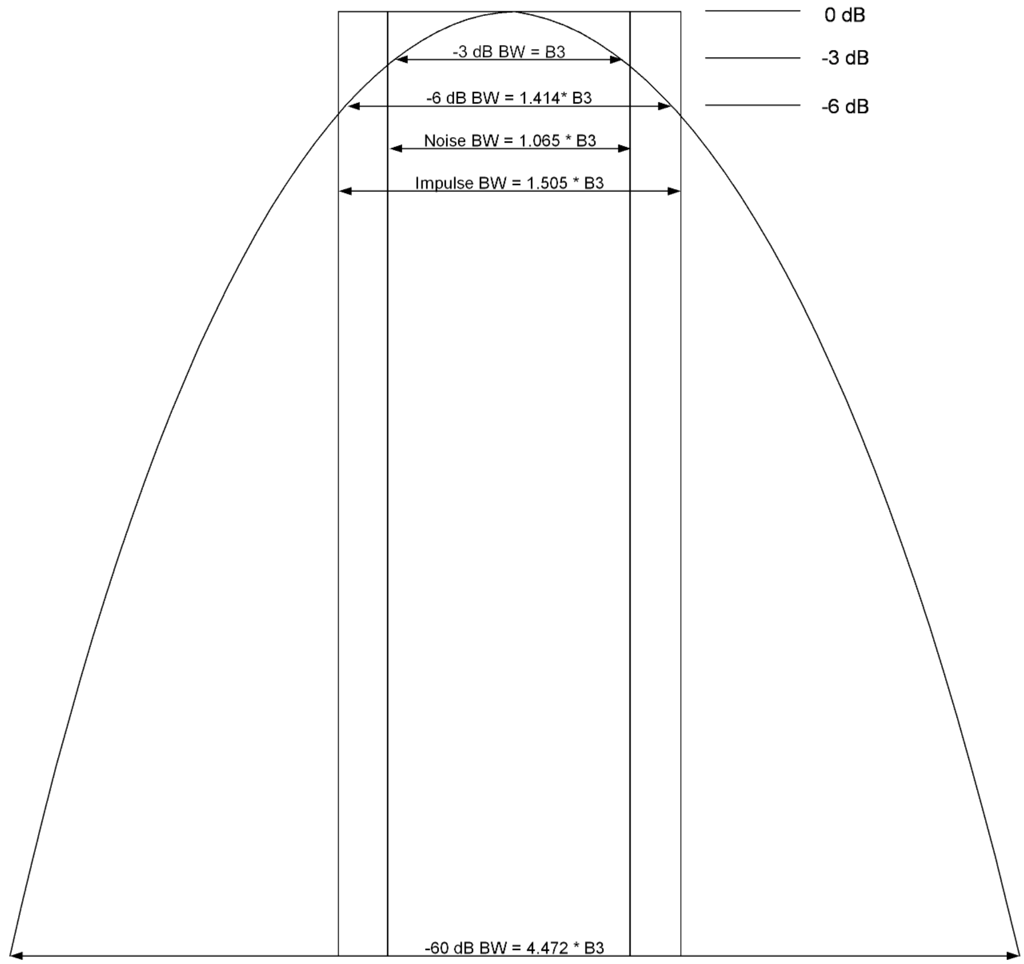
–3 dB (Normal) filter BW:	Res BW 300 Hz
–6 dB filter BW	Res BW (–6 dB) 422 Hz
Noise filter BW	Res BW (Noise) 317 Hz
Impulse filter BW	Res BW (Impulse) 444 Hz
CISPR filter BW	Res BW (CISPR) 200 Hz
MIL filter BW	Res BW (MIL) 1 kHz
Flattop filter type	Res BW (Flattop) 300 Hz

More Information

The instrument provides four ways of specifying the bandwidth of a Gaussian filter:

1. The –3 dB bandwidth of the filter
2. The –6 dB bandwidth of the filter
3. The equivalent Noise bandwidth of the filter, which is defined as the bandwidth of a rectangular filter with the same peak gain which would pass the same power for noise signals
4. The equivalent Impulse bandwidth of the filter, which is defined as the bandwidth of a rectangular filter with the same peak gain which would pass the same power for impulsive (narrow pulsed) signals

The following figure shows the relationships of the various filter bandwidths for filters with the X-Series' shape factor (shape factor is defined as the ratio of the –60 dB bandwidth to the – 3 dB bandwidth):



The **Filter Type** menu lets you choose the filter bandwidth (–3 dB, –6 dB, Noise or Impulse) that is used when specifying the width of the filter. Note that for a given Gaussian filter, changing the filter bandwidth specification does not affect the filter width at all but only the means of specifying it. For example, the filter whose –3 dB bandwidth is 1.0 kHz is the same as the filter whose –6 dB bandwidth is 1.41 kHz, whose Noise bandwidth is 1.06 kHz, and whose Impulse bandwidth is 1.48 kHz. As you cycle through these various filter bandwidths the filter does not change, but the way the filter is annotated and the value which appears in the active function area and on the control does.

Wide Bandwidths

Lets you access a set of Resolution Bandwidths that are wider than the standard **Res BWs**. These wide bandwidths only appear in the Swept SA measurement. The **Wide**

Bandwidths option can only be used under certain conditions:

- When **Span** is set to **Zero Span**
- When the **Sweep Type** is set to **FFT**, "µW Path Control" on page 1961 is set to `MPBypass`, and **FFT Width** is larger than **Res BW**

If these conditions are not met, this option is not available.

When **Wide Bandwidths** are `ON`:

- The minimum **Res BW** is 10 MHz. To select **Res BWs** 8 MHz or narrower, **Wide Bandwidths** must be `OFF`
- In **Zero Span**, a channel filter shape is used that is nearly square (shape factor 1.2:1), rather than Gaussian or Flattop, "RBW Filter Type" on page 251 is grayed-out and displays **Channel**. When **Sweep Type** is **FFT**, Gaussian and Flattop are still available
- In **Zero Span**, "RBW Filter BW" on page 252 is grayed-out, and shows **–3 dB**
- In **Zero Span**, no VBW filter is used, so VBW averaging is not available. Since VBW averaging is not available, the VBW annotation has the * symbol added (meaning no video averaging). When no VBW averaging is available, this is equivalent to having a VBW setting that is greater than **Res BW**
- The available "Detector" on page 518 types are **Peak** or **Average**. Only one detector can be used at a time
- In **Zero Span**, **Gate** is not available
- **TV Trigger** is not available
- In **Zero Span**, the minimum (fastest) sweep time is limited to a value that is typically between 200-400 µs, depending on the bandwidth and number of points you have set. This means you will not be able to set sweep times shorter than this value while **Wide Bandwidths** is `ON`

The instrument independently remembers the **Res BW** settings for when **Wide Bandwidths** is `OFF` and when **Wide Bandwidths** is `ON`. For example, if a **Res BW** of 300 kHz was set before **Wide Bandwidths** was turned `ON`, then the instrument will return to a **Res BW** of 300 kHz when **Wide Bandwidths** is turned `OFF`.

As with the standard set of **Res BWs**, there is a set of specific **Res BWs** available when **Wide Bandwidths** is `ON`.

In **Zero Span**, these are:

- Wideband IFs with information bandwidth less than 160 MHz : 10 MHz, 15 MHz, 20 MHz, 25 MHz, 30 MHz, 40 MHz, 50 MHz, 60 MHz, 70 MHz

– Wideband IFs with 160 MHz information bandwidth: add 80 MHz, 100 MHz and 133 MHz RBWs

– Wideband IFs with information bandwidth of 255 MHz or 510 MHz: add 150 MHz, 200 MHz and 212 MHz RBWs

When **Sweep Type** is **FFT**, these are:

– 10 MHz, 15 MHz, 20 MHz, 25 MHz, 30 MHz, 40 MHz, 50 MHz RBWs

Remote Command	`[:SENSe]:BANDwidth|BWIDth[:RESolution]:WIDE ON | OFF | 0 | 1` `[:SENSe]:BANDwidth|BWIDth[:RESolution]:WIDE?`
Example	`:BAND:WIDE ON` `:BAND:WIDE?`
Dependencies	Only appears if at least one of Options B85, B1A, B1X, B1Y, B2X, B5X is installed Only appears if Option RBE is installed Only appears in the Swept SA measurement Grayed-out unless in **Zero Span**, or **Swept** Type FFT with "µW Path Control" on page 1961 set to `MPBypass`, and **FFT Width** larger than **Res BW**
Preset	`OFF`
State Saved	Saved in instrument state

3.2.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.2.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Display Trace

Specifies which spectrogram trace to display in the trace window. This function determines which of the traces stored in the Spectrogram is currently being viewed in the trace window.

The display trace selection can be made by trace number or by trace time, depending on the setting of **Trace Selection**. **Display Trace 0** shows the latest trace.

The `TIME` form of this command (below) can be used to determine the time that the current trace in the spectrogram started, or to select as the display trace the trace whose start time is closest to the specified time. This time displays on **Display Trace** when **Trace Selection** is set to **Time**.

Remote Command	`:TRACe:DISPlay:VIEW:SPECtrogram:POSition <integer>` `:TRACe:DISPlay:VIEW:SPECtrogram:POSition?`
Example	`:TRAC:DISP:VIEW:SPEC:POS 146`
Dependencies	Only appears when the **Waterfall** window is visible, and either the **Waterfall** or **Spectrum** window is selected If the command is sent at any other time, it is accepted without error, but you will not see the result until you once again display the **Waterfall** window
Couplings	The input to this parameter can be trace number or trace time When Spectrogram occupies a window that has half vertical size, only 300 traces can be displayed in the trace window at any one time
Preset	Unaffected by **Mode Preset,** but set to 0 by **Restore Mode Defaults**. The value is remembered when you change in or out of **Spectrogram** View
State Saved	Saved in instrument state
Min	0
Max	1000

Start Time

Can be used to determine the time that the current trace in the spectrogram started or set the display trace to the approximate start time of the entered time.

The selection of the display trace can be by trace number or by trace start time. The `NUMBER` form (see "Display Trace" on page 257) can be used to select as the display trace the trace with the desired number.

Remote Command	`:DISPlay:WINDow4:TRACe:TIME <time>` `:DISPlay:WINDow4:TRACe:TIME?`
Example	Set the **Waterfall** display trace to be at the given start time. If the time is not exact, the approximate start will be calculated: `:DISP:WIND4:TRAC:TIME 250 ms`
Notes	Window 4 is the **Waterfall** window, associated with the Spectrogram
Dependencies	Only appears when a **Waterfall** window is visible, and either that window or its associated window (**Spectrum**) is selected If the command is sent at any other time, it is accepted without error, but you will not see the result until you once again display the **Waterfall** window
Preset	0 s
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`:TRACe:DISPlay:VIEW:SPECtrogram:TIME <time>`

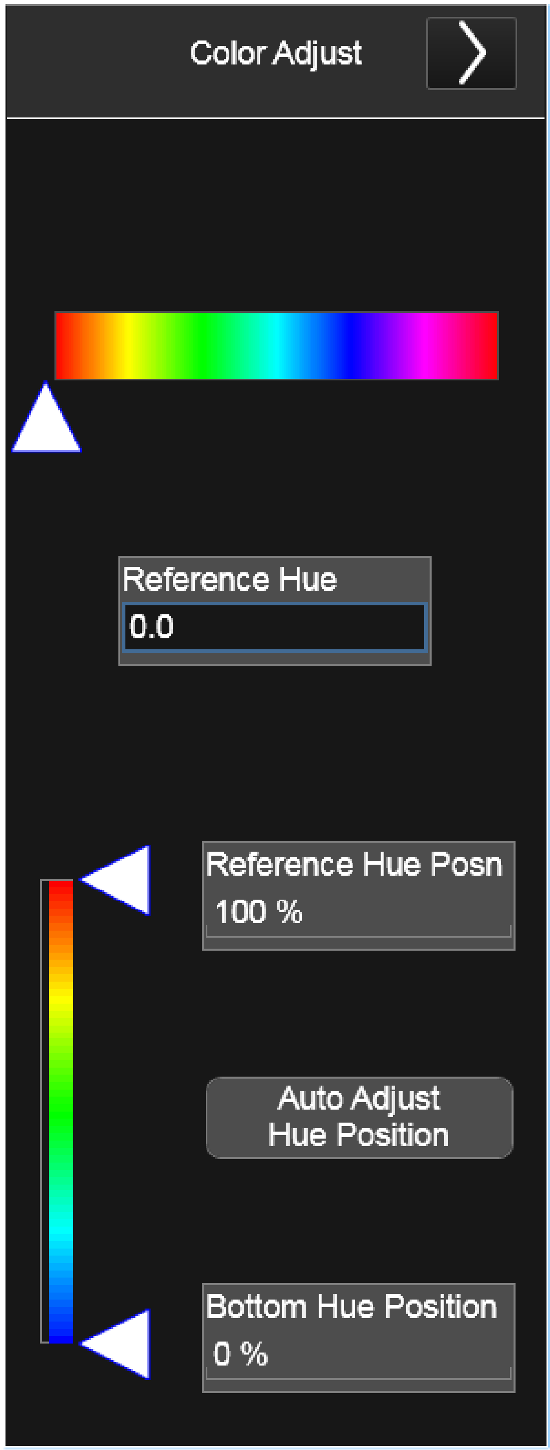
Couple Marker To Display Trace

Couples the marker to the selected "Display Trace" on page 257. When OFF, this allows you to fix the marker to the **Display Trace** that was active when the marker was turned on. When ON, the marker stays with the selected **Display Trace** as it is changed.

Remote Command	`:DISPlay:VIEW:SPECtrogram:TRACe:COUPle ON | OFF | 1 | 0` `:DISPlay:VIEW:SPECtrogram:TRACe:COUPle?`
Example	`:DISP:VIEW:SPEC:TRAC:COUP ON`
Dependencies	Only appears when the **Waterfall** window is visible, and either the **Waterfall** or **Spectrum** window is selected If the command is sent at any other time, it is accepted without error, but you will not see the result until you once again display the **Waterfall** window
Preset	`OFF`
State Saved	Saved in instrument state

Color Adjust

Lets you adjust the color mapping of the Spectrogram display. Adjusting the color map can help you find an array of colors whose contrast is more ideally suited to your signal, or to exclude regions of the display that you do not wish to see. See "Examples" on page 261 below.

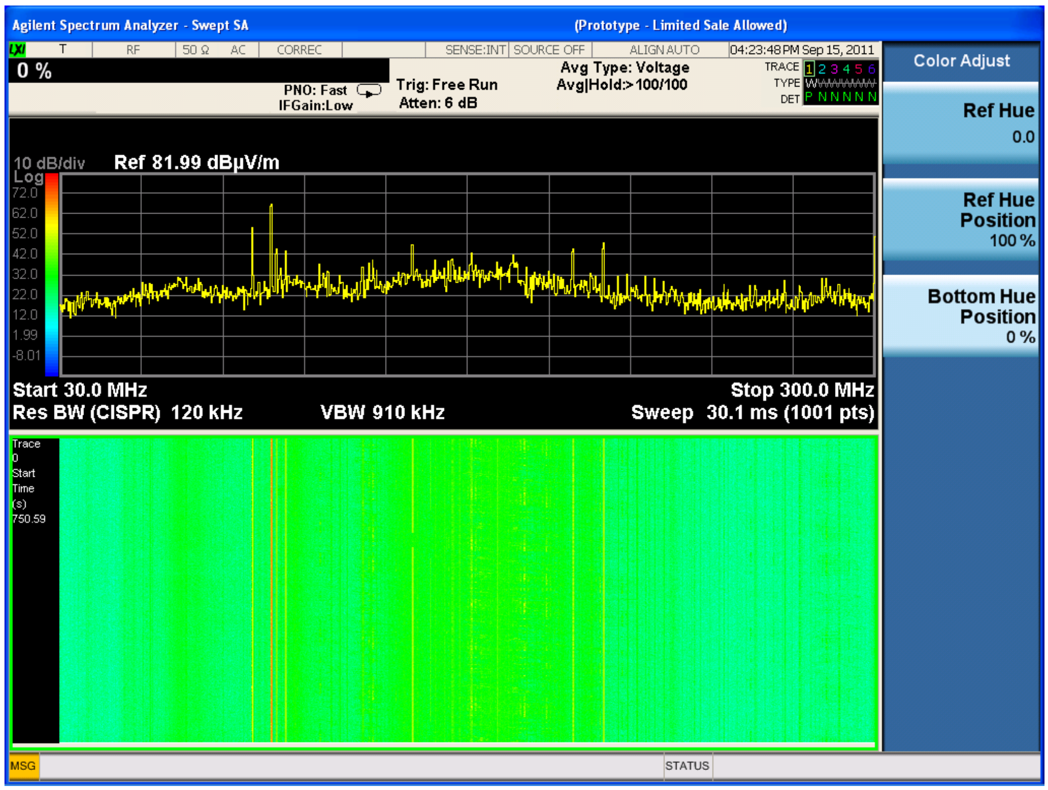


Color Adjust
Reference Hue
0.0
Reference Hue Posn
100 %
Auto Adjust
Hue Position
Bottom Hue Position
0 %

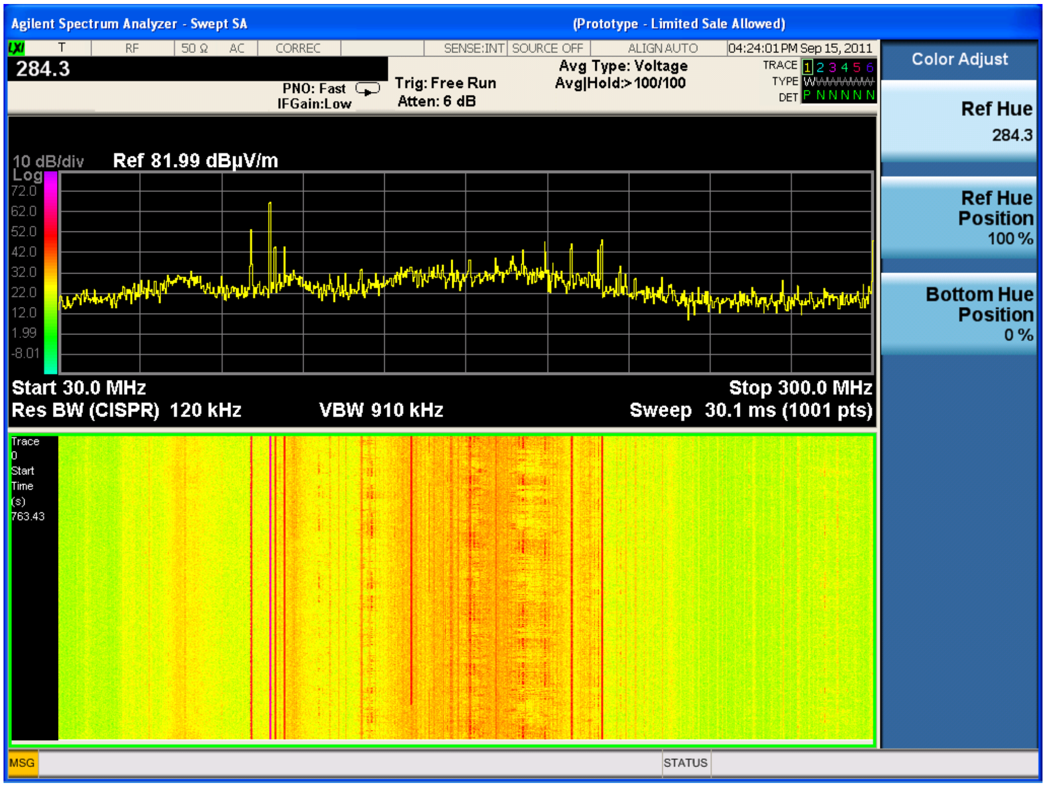
Dependencies	Only appears when the **Waterfall** window is visible, and either the **Waterfall** or **Spectrum** window is selected If the command is sent at any other time, it is accepted without error, but you will not see the result until you once again display the **Waterfall** window

Examples

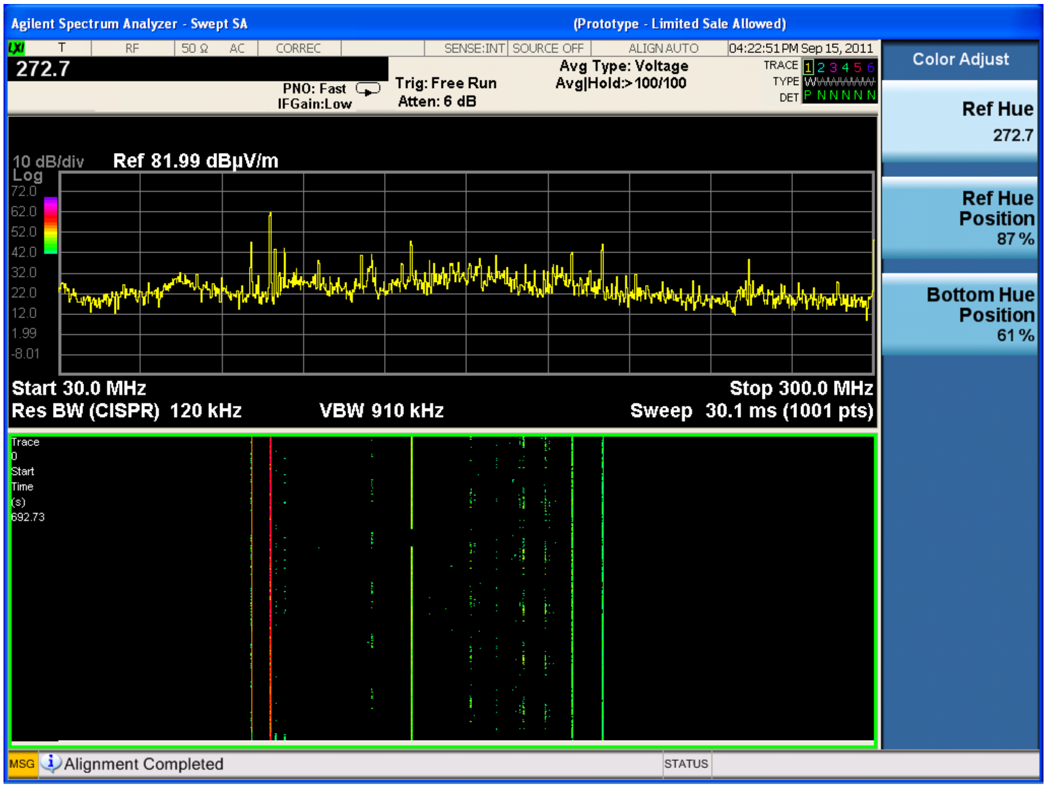
An example of Ref Hue in action appears below. Here is a typical Spectrogram display:



Here is the same display with "Reference Hue" on page 263 adjusted for better contrast:



Here is the same display with **Reference Hue**, "Reference Hue Position" on page 265, and "Bottom Hue Position" on page 266 all adjusted to exclude unwanted signals and optimally show desired signals:



Reference Hue

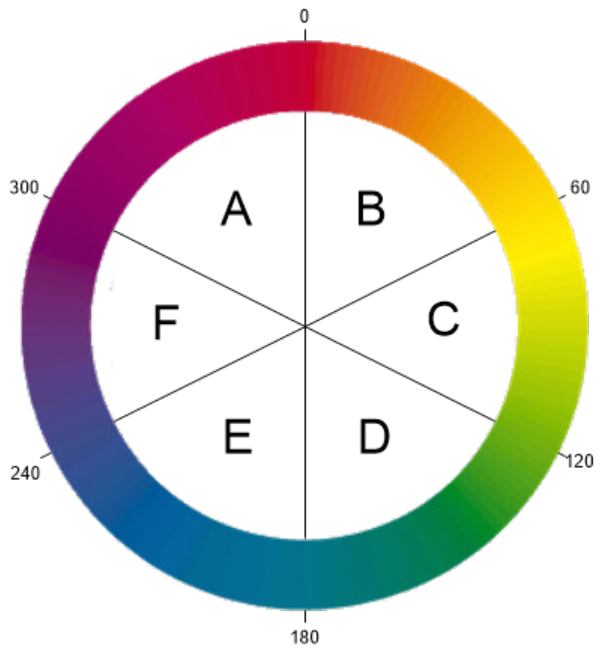
Adjusts the hue at the top of the spectrogram color bar. The Spectrogram color bar is the bar placed next to the trace display to map colors into the **Spectrogram** window. You can adjust using the Active Function or move the top arrow up and down with your finger.

"Explaining Hue concept" on page 264

Remote Command	`:DISPlay:VIEW:SPECtrogram:HUE <real>` `:DISPlay:VIEW:SPECtrogram:HUE?`
Example	`:DISP:VIEW:SPEC:HUE 120`
Preset	0
State Saved	Saved in instrument state
Min	0, but the next decrement takes you to 359
Max	359.9, but the next increment takes you back to 0

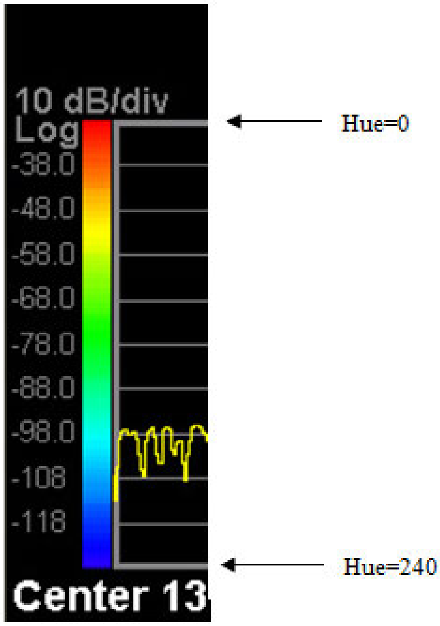
Explaining Hue concept

To understand how **Reference Hue** works, we need to understand the concept of "Hue". The hues of colors run from 0 to 359 (360 is the same as 0) as shown on the color wheel below:

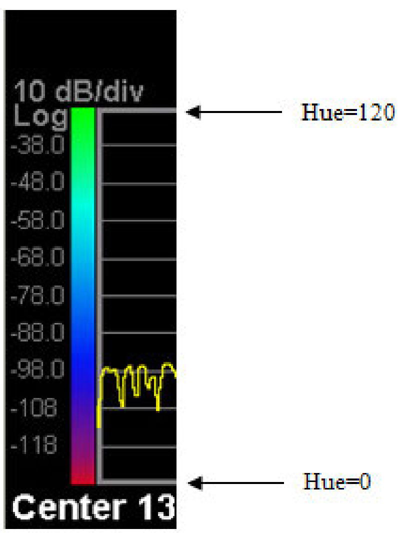


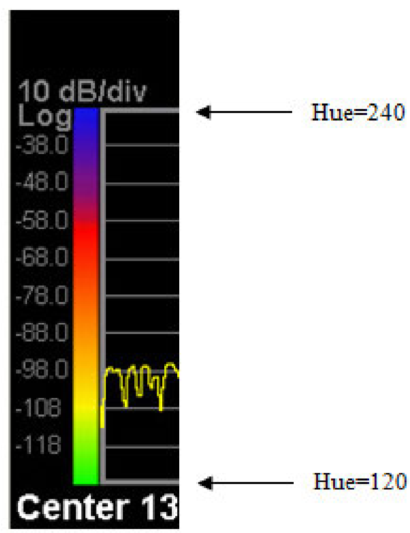
Hue 0 is Red (255,0,0), Hue 120 is Green (0,255,0) and Hue 240 is Blue (0,0,255). Hue 60 is Yellow (255,255,0), Hue 180 is Cyan (0,255,255) and Hue 300 is Magenta (255,0,255). In region A-B, the red value is constant (255), in C-D, the green value is constant (255), and in E-F, the blue value is constant (255). There is no green in region F-A, there is no Red in E-D, and there is no Blue in B-C.

When you adjust **Reference Hue**, you are adjusting the hue at the top of the color bar. The bottom of the color bar shows the hue that is 240 degrees clockwise from the **Reference Hue**. Thus, in the normal case, the color bar appears like this:



Here are other examples of Ref Hue settings:

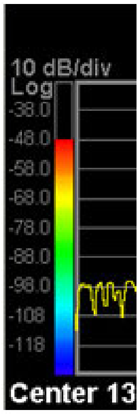




Reference Hue Position

Lets you adjust where, as a percentage of the graticule, the "Reference Hue" on page 263 appears. Above the **Reference Hue Position**, any amplitudes simply map as black.

As an example, here is what the color bar looks like when **Reference Hue Position** is set to 80%:

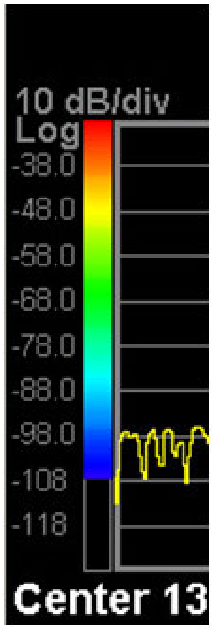


See "Color Adjust" on page 259 for more examples

Remote Command	`:DISPlay:VIEW:SPECtrogram:REFerence <integer>` `:DISPlay:VIEW:SPECtrogram:REFerence?`
Example	`:DISP:VIEW:SPEC:REF 60`
Preset	100
State Saved	Saved in instrument state
Min	Cannot go any lower than 10%, or "Bottom Hue Position" on page 266 + 10, whichever is higher
Max	100

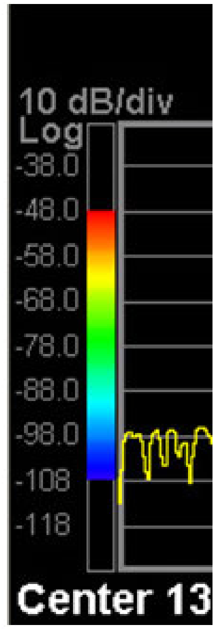
Bottom Hue Position

Lets you adjust where, as a percentage of the graticule, the bottom of the color bar appears. Below the color bar is black, and any amplitudes in this region simply map as black.



Ref Hue Position = 100%

Bottom Hue Position = 20%



Ref Hue Position = 80%

Bottom Hue Position = 20%

See "Color Adjust" on page 259 for more examples

Remote Command	`:DISPlay:VIEW:SPECtrogram:BOTTom <integer>` `:DISPlay:VIEW:SPECtrogram:BOTTom?`
Example	`:DISP:VIEW:SPEC:BOTT 40`
Preset	0
State Saved	Saved in instrument state
Min	0
Max	Cannot go any higher than 90%, or "Reference Hue Position" on page 265 – 10, whichever is lower

Auto Adjust Hue Position

Sets "Reference Hue Position" on page 265 to the highest amplitude value found in the Spectrogram, and sets "Bottom Hue Position" on page 266 to the lowest amplitude value found in the Spectrogram.

Remote Command	`:DISPlay:VIEW:SPECtrogram:AADJust`
Example	`:DISP:VIEW:SPEC:AADJ`

Select Display Line

Allows you to select the display line currently being controlled by "Display Line" on page 268.

Preset	1

Display Line

Activates an adjustable horizontal line that is used as a visual reference line. The line’s vertical position corresponds to its amplitude value. The value of the display line (for example, –20.3 dBm) appears right-justified above the line itself on the right side of the display, marked **DL** for measurements that support only one **Display Line**. For measurements that support more than one; **DL1** for **Display Line 1**, “**DL2**” for **Display Line 2**, etc.

In measurements that support multiple **Display Lines**, this control affects whichever **Display Line** has been selected by "Select Display Line" on page 268.

The **Display Line** can be adjusted using the step keys, knob, or numeric keypad. It can also be dragged on the display with your finger or a mouse. The unit of **Display Line** is determined by "Y Axis Unit" on page 1832 under **Amplitude**. If more than one window has a display line, the display line of the selected window is controlled.

If the **Display Line** is off the screen, it shows as a line at the top/bottom of the screen with an arrow pointing up or down. As with all such lines (Pk Thresh, Trigger Level, etc.) it is drawn on top of all traces.

Unaffected by "Auto Couple" on page 1995.

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y:DLINe[1]|2|…|4 <ampl>` `:DISPlay:WINDow[1]:TRACe:Y:DLINe[1]|2|…|4?`

Example	Turn on **Display Line**; or if multiple display lines, turns on **Display Line 1**:
	`:DISP:WIND:TRAC:Y:DLIN:STAT ON`
	Adjust **Display Line 2**:
	`:DISP:WIND:TRAC:Y:DLIN2 -32 dBm`

Couplings	When a value is set for the display line, it is turned `ON` When **Display Line** switches from `OFF` to `ON`, if it is off-screen, it is set to either the top or bottom of screen, depending on which direction off-screen it was The **Display Line**'s value does not change when it is turned `OFF`
Preset	**Display Line 1** selected, `OFF`, and set to -25 dBm
State Saved	Saved in instrument state
Min/Max	–/+∞ (minus/plus infinity) in current units

Auto Function

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y:DLINe[1]|2|…|4:STATe OFF | ON | 0 | 1` `:DISPlay:WINDow[1]:TRACe:Y:DLINe[1]|2|…|4:STATe?`
Preset	`OFF`

Select Freq Line

Lets you select the display line currently being controlled by "Freq Line" on page 269.

Preset	1

Freq Line

Activates an adjustable vertical line that is used as a visual reference line. The line’s horizontal position corresponds to its frequency value. The value of the frequency line (for example, 2.5 GHz) appears at the top of the display, to the right or left of the line justified as required for it to be on screen, marked **FL1** for **Freq Line 1**, **FL2** for **Freq Line 2**, etc.

This control affects whichever **Freq Line** has been selected by "Select Freq Line" on page 269.

The **Freq Line** can be adjusted using the step keys, knob, or numeric keypad. It can also be dragged on the display with your finger or a mouse. If more than one window has a **Freq Line**, the **Freq Line** of the selected window is controlled.

If the **Freq Line** is off-screen, it shows as a line at the left or right of the screen. As with all such lines (Pk Thresh, Trigger Level, etc.) it is drawn on top of all traces.

Unaffected by "Auto Couple" on page 1995.

Remote Command	`:DISPlay:WINDow[1]:TRACe:X:FLINe[1]|2|…|4 <ampl>` `:DISPlay:WINDow[1]:TRACe:X:FLINe[1]|2|…|4?`

Example	Turn **Freq Line 1** on:
	`:DISP:WIND:TRAC:X:FLIN:STAT ON`
	Set **Freq line 3** to 1 GHz:
	`:DISP:WIND:TRAC:X:FLIN3 1 GHz`

Dependencies	Freq Lines, and this control, only display in Swept Spans
Couplings	When a value is set for **Freq Line**, it is turned `ON` When **Freq Line** goes from `OFF` to `ON`, if it is off-screen, it is set to either the left or right of screen, depending on which direction off-screen it was The **Freq Line**'s value does not change when it is turned `OFF`
Preset	**Freq Line 1** selected, `OFF`, and set to 1 GHz
State Saved	Saved in instrument state

Auto Function

Remote Command	`:DISPlay:WINDow[1]:TRACe:X:FLINe[1]|2|…|4:STATe OFF | ON | 0 | 1` `:DISPlay:WINDow[1]:TRACe:X:FLINe[1]|2|…|4:STATe?`
Preset	`OFF`

Select Time Line

Allows you to select the display line currently being controlled by "Time Line" on page 270.

Preset	1

Time Line

Activates an adjustable vertical line that is used as a visual reference line. The line's horizontal position corresponds to its time value. The value of the **Time Line** (for example, 1 ms) appears at the top of the display, to the right or left of the line justified as required for it to be on-screen, marked **TL1** for **Time Line 1**, **TL2** for **Time Line 2**, etc.

This key controls whichever **Time Line** has been selected by "Select Time Line" on page 270.

The **Time Line** can be adjusted using the step keys, knob, or numeric keypad. It can also be dragged on the display with your finger or a mouse. If more than one window has a **Time Line**, the **Time Line** of the selected window is controlled.

If the **Time Line** is off-screen, it shows as a line at the left or right of the screen. As with all such lines (Pk Thresh, Trigger Level, etc.) it is drawn on top of all traces.

Unaffected by "Auto Couple" on page 1995.

Remote Command	`:DISPlay:WINDow[1]:TRACe:X:TLINe[1]|2|…|4 <ampl>` `:DISPlay:WINDow[1]:TRACe:X:TLINe[1]|2|…|4?`

Example	Turn **Time Line 1** on:
	`:DISP:WIND:TRAC:X:TLIN:STAT ON`
	Set **Time Line 3** to 1.2 ms:
	`:DISP:WIND:TRAC:X:TLIN3 1.2 ms`

Dependencies	Time Lines, and this control, only display in **Zero Span**
Couplings	When a value is set for **Time Line**, it is turned `ON` When **Time Line** switches from `OFF` to `ON`, if it is off-screen, it is set to either the left or right of screen, depending on which direction off-screen it was The **Time Line**'s value does not change when it is turned `OFF`

Preset	**Time Line 1** selected, OFF, and set to 1 ms
State Saved	Saved in instrument state

Auto Function

Remote Command	:DISPlay:WINDow[1]:TRACe:X:TLINe[1]|2|…|4:STATe OFF | ON | 0 | 1 :DISPlay:WINDow[1]:TRACe:X:TLINe[1]|2|…|4:STATe?
Preset	OFF

3.2.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1 :DISPlay:GRATicule[:STATe]?
Example	:DISP:GRAT OFF
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1 :DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]? This command is accepted for backwards compatibility with older instruments, but the WINDow, TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When OFF, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ....

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	`:DISPlay:ANNotation:FREQuency[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:FREQuency[:STATe]?`
Example	`:DISP:ANN:FREQ OFF`
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	`ON`

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

– and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)

– and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)

– and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" or "221, Settings conflict; View SCPI cannot be used while Display is disabled". These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`

Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.2.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 185

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	:DISPlay:VIEW:ADVanced:SELect <alphanumeric> :DISPlay:VIEW:ADVanced:SELect?
Example	Select Baseband as the current View :DISP:VIEW:ADV:SEL “Baseband”
Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send: :DISP:VIEW:ADV:SEL "Trace Zoom" because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu You *cannot* use the legacy View parameter (which in this case would be TZOom) with :DISP:VIEW:ADV:SEL <alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work: :DISP:VIEW:ADV:SEL "Trace Zoom" :DISP:VIEW:ADV:SEL "TRACE ZOOM" If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist” If the display is disabled (via :DISP:ENAB OFF) then the error message “-221, Settings conflict;

	View SCPI cannot be used while Display is disabled" is generated
Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME "Baseband"` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN “Baseband”`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot rename a Predefined View” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> does not exist” is generated If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot delete a Predefined View” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`

Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1983), then query the list of available Views, the result is undefined

3.2.6 Frequency

Allows you to control the **Frequency** parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**. For example, the "Center Frequency" on page 279 setting is the same for all measurements – it does not change as you change measurements.

3.2.6.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the horizontal (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule (when frequency Scale Type is set to linear). While adjusting **Center Frequency**, **Span** is held constant, which means that both "Start Freq" on page 290 and "Stop Freq" on page 292 will change.

Pressing **Center Frequency** sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the **Frequency** menu is **Center Frequency**. In the Start/Stop annotation mode, **Start Freq** and **Stop Freq** are displayed below the graticule instead of **Center Frequency** and **Span**.

Pressing **Center Frequency** also sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the **Frequency** menu is **Center Frequency**.

When **Display Scale Type** is set to `LOG`, pressing **Center Frequency** sets the frequency that corresponds to the arithmetic mean of the start frequency and stop frequency, which is not at the horizontal center of the graticule.

The center frequency setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, the Mode has a **Global** tab in its **Meas Setup** menu.

Center Frequency sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input (see "RF Center Frequency" on page 283 and "Ext Mix Center Freq" on page 284).

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you return to the RF Input, **Center Frequency** reverts to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	Set Center Frequency to 50 MHz:
	`:FREQ:CENT 50 MHz`
	Increment **Center Frequency** by the value of "CF Step" on page 298:
	`:FREQ:CENT UP`
	Return the current value of **Center Frequency**:
	`:FREQ:CENT?`

Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: – For RF input it is equivalent to `:FREQ:RF:CENT` – For I/Q input it is equivalent to `:FREQ:IQ:CENT` – For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than frequency is used, an invalid suffix error message is generated
Dependencies	**Center Frequency** can be limited by **Start Freq** or **Stop Freq** limits, if **Span** is so large that start or stop reach their limits
Couplings	When operating in "swept span", any value of **Center Frequency** or **Span** that is within the frequency range of the instrument is allowed, *if* the value is being set through the front panel numeric key pad or the SCPI command. The other parameter is forced to a different value if needed, to keep Start and Stop Frequencies within the instrument's frequency range Coupling between center frequency and span: numeric (keypad) entries are treated differently than changing the value using the step keys (**Up/Down Arrows**) or the knob. Similarly, for remote operation, sending a numeric frequency value is treated differently than the `UP|DOWN` keywords: – Numeric entries (keypad or remote): Any value of **Center Frequency** or **Span** (within the frequency range of the instrument) is allowed. The other parameter is changed, as necessary, to keep the Start Freq and Stop Freq within the instrument frequency range – Knob or Step keys (up/down arrows) or `UP|DOWN` keywords: The value of the parameter being changed (**Center Frequency** or **Span**) is limited so the other parameter is not forced to a new value. Thus, if only the step keys and knob are used, you can return to the initial **Center Frequency** and **Span** by changing only the current parameter Note that, since out-of-range **Start Freq** and **Stop Freq** are never allowed, markers and trace math

	work correctly without requiring any special handling for out-of-range conditions
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 281 and "Ext Mix Center Freq" on page 284
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 281 and "Ext Mix Center Freq" on page 284
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can’t tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can’t tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Frequency

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set **Center Frequency** such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning If Source Mode is set to Tracking, and the Max or Min **Center Frequency** is therefore limited by the limits of the source, a warning message is generated, "Data out of range; clipped to source max/min" if these limits are exceeded. Note that for an external source, these limits can be affected by the settings of Source Numerator, Source Denominator, and Power Sweep
Preset	See "Center Frequency Presets" on page 281
State Saved	Saved in instrument state

Min	<table><tr><th>Instrument Types</th><th>Value</th></tr><tr><td>VXT model M9421A</td><td>55.000005 MHz</td></tr><tr><td>VXT models M9410A/11A</td><td>6.505 kHz with Option LFE 330.000005 MHz without Option LFE 330.000005 MHz</td></tr><tr><td>VXT model M9415A</td><td>330.000005 MHz</td></tr><tr><td>M8920A</td><td>80.005 kHz</td></tr><tr><td>All other instruments *Unless* Source Mode is set to Tracking, in which case it is limited by the minimum frequency of the Source</td><td>–79.999995 MHz</td></tr></table>
Max	See table above. Basically, instrument maximum frequency – 5 Hz. Note that, if the Source Mode is set to Tracking, the effective instrument maximum frequency may be limited by the source maximum frequency If the knob or step keys are being used, also depends on the value of the other three interdependent parameters: **Span**, **Start Frequency** and **Stop Frequency**

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Frequency** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When you return to External Mixing after using one of the other inputs (for example, RF), you return to the settings that you had when you left External Mixing. So, you return to the band you were in with the **Center Frequency** that you had. However, **Span** is *not* an input-dependent parameter, so it does not change. Therefore, the instrument comes back with the **Span** from the previous input, limited as necessary by the current mixer setup
Preset	When **Mode Preset** is performed while in External Mixing, the start frequency of the current Mode is set to the nominal Min frequency of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the stop frequency of the current Mode is set to the nominal Max frequency of the

	highest harmonic range in the Harmonic Table. **Center Frequency** thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited **Span** available to it, and cannot achieve the span shown in the table (**Span** = **Stop Freq** – **Start Freq**), the instrument uses the maximum span that the measurement allows, and still sets **Center Frequency** to the midpoint of the **Start Freq** and **Stop Freq** values in the Harmonic Table When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after **Restore Input/Output Defaults**, if you switch to External Mixing and do a **Mode Preset** while in the Spectrum Analyzer Mode, the resulting **Center Frequency** is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on the value of the other three interdependent parameters **Span**, **Start Freq** and **Stop Freq**

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting **Span**, "Center Frequency" on page 279 is held constant, which means that both "Start Freq" on page 290 and "Stop Freq" on page 292 will change.

Pressing **Span** also sets the frequency entry mode to Center/Span. In Center/Span mode, the **Center Frequency** and **Span** values are displayed below the graticule, and the default active function in the **Frequency** menu is **Center Frequency**.

Span also includes a toggle switch to go back and forth between **Swept Span** and **Zero Span**. **Zero Span** is a special sweep type in which the instrument stops sweeping over a range of frequencies, and stays at the **Center Frequency**. In **Zero Span**, the instrument sweeps in the time domain, showing you the instantaneous amplitude versus time at the **Center Frequency**. For more details, see "Zero Span" on page 288. Selecting **Swept Span** places the instrument in Center/Span frequency entry mode.

When in **Zero Span**, you can return to your last **Swept Span** by pressing the Swept Span/Zero Span toggle on **Span**. (This replaces the **Last Span** function found on older HP/Agilent/Keysight Analyzers.)

NOTE	We use the term **Swept Span** to mean spans *other* than **Zero Span**, even though sometimes when we are in what we call a **Swept Span** we might be performing an FFT-style sweep, which is not a true **Swept Span**.

If **Span** is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

Remote Command	`[:SENSe]:FREQuency:SPAN <freq>` `[:SENSe]:FREQuency:SPAN?`
Example	Set the span to 2 GHz: `:FREQ:SPAN 2GHz`
Dependencies	If the electrical attenuator is enabled, any attempt to set **Span** such that the **Stop Freq** would be >3.6 GHz results in an error If Source Mode is set to Tracking, and **Span** is therefore limited by the limits of the source, a warning message is generated, "Data out of range; clipped to source max/min" if these limits are exceeded. Note that for an external source, these limits can be affected by the settings of Source Numerator, Source Denominator, and Power Sweep In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in **Continuous** sweep, because there is a mechanical switch that bypasses the RF Preselector above 3.6 GHz. For details, see **Stop Freq**
Couplings	**Span** affects **Res BW**, **Sweep Time**, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings) When operating in **Swept Span**: – When the value is being set through the front panel numeric keypad or the SCPI command, any value of **Center Frequency** or **Span** that is within the frequency range of the instrument is allowed. The other parameter is forced to a different value, if necessary, to keep **Start Freq** and **Stop Freq** within the instrument's frequency range – When using the knob or the step up/down keys, or the `UP |DOWN` keywords in SCPI, the value that is being changed, that is, **Center Frequency** or **Span**, is limited so that the other parameter is not forced to a new value **Span** cannot be set to zero by setting **Start Freq** = **Stop Freq**. The value of the last setting changes to maintain a minimum difference of 10 Hz between **Start Freq** and **Stop Freq**
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Span Presets" on page 287
State Saved	Saved in instrument state
Min	10 Hz, unless entered directly, then 0 Hz is allowed, but no value *between* 0 and 10 is ever allowed If the **Zoomed Trace** window is visible, **Zero Span** is not allowed, so **Span** may not go below 10 Hz If the **Zone Spectrum** window is visible, **Zero Span** is not allowed in the **Spectrum** window, so **Span** may not go below 10 Hz in the **Spectrum** window
Max	Depends on instrument maximum frequency, mode, measurement, and selected input. See "Span Presets" on page 287 If the knob or step keys are being used, depends on the value of the other three interdependent parameters: **Center Frequency**, **Start Freq**, **Stop Freq** Note that, if the Source Mode is set to **Tracking**, the effective instrument maximum Span may be limited by the source maximum frequency

Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display
Status Bits/OPC dependencies	Overlapped if Signal Track is on (OPC does not return or clear until the zooming has completed for the new span)

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	45.08 GHz
550	52 GHz
F06 & EP6 (VXT models M9410A/11A)	6.27 GHz
F06 & LFE & EP6 (VXT models M9411A)	6.5999935 GHz
M9415A-F06	6.27 GHz
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Preset Value
SA	8 MHz

Mode	Preset Value
WCDMA	24.6848 MHz
WIMAX OFDMA	50 MHz
C2K	4.5 MHz
TD-SCDMA	8 MHz
1xEVDO	4.05 MHz
DVB-T/H	40 MHz
DTMB (CTTB)	72 MHz
ISDB-T	30 MHz
CMMB	72 MHz
LTE, LTETDD, LTEAFDD, LTEATDD, MSR	25 MHz
Digital Cable TV	40 MHz
5G NR	500 MHz
Radio Test	175 kHz

N9041B Span Presets

Input/Freq Option	Span after Mode Preset	Max Span (can't set higher than this)
Input 1, all models	49.99 GHz	52 GHz
Input 2, opt 585	84.99 GHz	86 GHz
Input 2, opt 590	89.99 GHz	92 GHz
Input 2, opt 5CX	109.99 GHz	110 GHz

Note that if you are in External Mixing, the maximum **Span** is equal to Maximum **Stop Freq** – Minimum **Start Freq** for the currently selected mixer.

Zero Span

While in **Swept Span**, pressing the **Swept Span/Zero Span** toggle on **Span** puts you in **Zero Span**. You can also switch to **Zero Span** by setting **Span** to 0 Hz through SCPI or the front panel numeric keypad. However, you *cannot* switch to **Zero Span** by setting "Start Freq" on page 290 = "Stop Freq" on page 292 using the numeric keypad, nor by using the **Step** keys and the **RPG** to "roll" down to zero, because **Span** can only go as far down as 10 Hz by this means.

Example	Set **Span** to zero, switch to **Zero Span**: `:FREQ:SPAN 0 Hz` Sending `:FREQ:SPAN 1 MHz`, while in **Zero Span**, switches to Swept span
Dependencies	If the **Zoomed Trace** window is visible, **Zero Span** is not allowed If the **Zone Spectrum** window is visible, **Zero Span** is not allowed in the **Spectrum** window

Couplings	Switching to **Zero Span**: – Turns off **Signal Track** – Turns off the auto-coupling of **Res BW** and sweep time – Places the instrument in Center/Span frequency entry mode

When you enter **Zero Span**, the instrument changes the displayed frequency span to 0 Hz. The horizontal axis changes to time rather than frequency. The amplitude displayed is the input signal level at the current center frequency. This is a time-domain mode that changes several measurement functions and couplings. The instrument behavior is similar to an oscilloscope with a frequency selective detector installed in front of the oscilloscope. See Application Note 150 for more information on how to use **Zero Span**.

While in **Zero Span**, setting **Span** to a non-zero value through SCPI or the front Panel returns the instrument to **Swept Span**. You can also return to your last **Swept Span** by pressing the **Swept Span/Zero Span** toggle on the **Span** control.

The following table summarizes the differences between **Zero Span** and **Swept Span**:

Zero Span	Swept Spans
X axis is time	X axis is frequency
There is no auto-**Res BW** selection unless the EMC Standard is CISPR or MIL	**Res BW** coupled to **Span** when **Res BW** in **Auto**
There is no auto sweep time	Sweep time coupled to Res BW when sweep time in auto
Interval Power calculated in Mkr Function	Band Power calculated in Mkr Function
Can only define time limits when in zero span	Can only define frequency limits when in Swept SA
Marker Count counts at the center frequency	**Marker Count** counts at the marker frequency
CF Step size set to **Res BW** value	**CF Step** autocouples to 10% of **Span**
Some **Marker ->** commands not available	Other **Marker ->** commands not available
Freq entry mode always Center/Span	Freq entry mode can be Center/Span or Start/Stop
N dB points reports a time difference	N dB points reports a frequency difference

Full Span

Changes the frequency span of the instrument to the Preset frequency span of the instrument and sets the **Frequency** entry mode to Center/Span.

Span depends on the currently selected input. For example, when using external mixing, **Full Span** changes the frequency to the Preset frequency range specified for the selected external mixing band.

Pressing this control while in **Zero Span** returns the instrument to **Swept Span**.

Remote Command	`[:SENSe]:FREQuency:SPAN:FULL`
Example	Set the span to full frequency range of the instrument: `:FREQ:SPAN:FULL`
Couplings	Turns off signal tracking (span zoom). Does *not* turn off markers, or the current active function

Start Freq

Sets the frequency at the left side of the graticule. While adjusting **Start Freq**, "Stop Freq" on page 292 is held constant, which means that both "Center Frequency" on page 279 and "Span" on page 285 will change.

Start Freq also sets the frequency entry mode to **Start** or **Stop**. In **Start** or **Stop** mode, the start frequency and stop frequency values are displayed below the graticule, and the default active function in the **Frequency** menu is **Start Freq.**

Remote Command	`[:SENSe]:FREQuency:STARt <freq>` `[:SENSe]:FREQuency:STARt?`
Example	`:FREQ:STAR 200 MHz` `:FREQ:STAR?`
Notes	Max value depends on Hardware Options
Dependencies	By direct entry: – You cannot set **Start Freq** > **Stop Freq** – You cannot set **Start Freq** = **Stop Freq** – You cannot select Zero Span by setting **Start Freq** = **Stop Freq** – You cannot set **Start Freq** to a value that would create a span of less than 10 Hz If you try to do any of the above, **Stop Freq** changes to maintain a minimum of 10 Hz for the difference between **Start Freq** and **Stop Freq** With the knob or step keys: – You cannot increment **Start Freq** to a value greater than **Stop Freq** – 10 Hz. If already in **Zero Span**, you cannot increment at all, and the first decrement is forced to at least 10 Hz **Start Freq** can be limited by **Span** limits, if **Stop Freq** is below its preset value If the electronic/soft attenuator is enabled, any attempt to set **Start Freq** such that **Stop Freq** would be >3.6 GHz fails, and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning

	If "Source Mode" on page 456 is set to **Tracking**, and the Max or Min **Start Freq** is therefore limited by the limits of the source, a warning message is generated, "Data out of range; clipped to source max/min" if these limits are exceeded. Note that for an external source, these limits can be affected by the settings of Source Numerator, Source Denominator, and Power Sweep
Couplings	The four parameters **Center Frequency**, **Start Freq**, **Stop Freq** and **Span** are interdependent, as changing one necessarily affects one or more of the others. The couplings between **Center Frequency** and **Span** are detailed under the control descriptions for those controls. These couplings also affect **Start Freq** and **Stop Freq**
Preset	**Start Freq** does not preset. On **Mode Preset**, **Span** & **Center Frequency** preset, and **Start Freq** is derived. On **Meas Preset**, only **Span** presets, but **Center Frequency** does not, so **Start Freq** will vary depending on **Center Frequency** When **Mode Preset** is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup Note that, if the current measurement has a limited **Span** available to it, and cannot achieve the **Span** shown in the table (**Span** = **Stop Freq** – **Start Freq**), the instrument uses the maximum **Span** the measurement allows, and sets **Center Frequency** to the midpoint of the **Start Freq** and **Stop Freq** values in the Harmonic Table. Thus, in this case, **Start Freq** presets to a frequency below the preset **Center Frequency** by ½ of the maximum **Span** When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A, whose Start frequency is 26.5 GHz Therefore, after **Restore Input/Output Defaults**, if you switch to External Mixing and do **Mode Preset** while in Spectrum Analyzer Mode, the resulting **Start Freq** is 26.5 GHz
State Saved	Saved in instrument state
Min	-80 MHz, unless **Source Mode** is set to **Tracking**, in which case it is limited by the minimum frequency of the Source

Instrument Type	Min Value
VXT model M9421A	55 MHz
VXT models M9410A/11A	330 MHz
VXT models M9410A/11A	With Option LFE: 6.5 kHz Without Option LFE: 330 MHz
VXT model M9415A	330 MHz
M8920A	80 kHz

	If the knob or step keys are being used, depends on the value of the other three interdependent parameters While in External Mixing, the minimum **Start Freq** you can set is determined by the external mixing parameters. It will be close to the minimum LO frequency (3.8 GHz if undoubled, 8.6 GHz if doubled) times the harmonic number, for the lowest harmonic range in the Harmonic Table for the current mixer setup. It can be queried with `:FREQ:STARt? MIN`
Max	Depends on the instrument maximum frequency – 10 Hz. Note that, if **Source Mode** is set to **Tracking**, the effective instrument maximum frequency may be limited by the source maximum frequency If the knob or step keys are being used, it depends on the value of the other three interdependent

	parameters While in External Mixing, the maximum **Start Freq** you can set is determined by the external mixing parameters. It will be close to the maximum LO frequency (7 GHz if undoubled, 14 GHz if doubled) times the harmonic number, for the highest harmonic range in the Harmonic Table for the current mixer setup. It can be queried with `:FREQ:STARt? MAX`
Annotation	Start <value> appears in the lower left corner of the display. This replaces Center <value>
Status Bits/OPC dependencies	Non-overlapped

Stop Freq

Sets the frequency at the right side of the graticule. While adjusting **Stop Freq**, "Start Freq" on page 290 is held constant, which means that both "Center Frequency" on page 279 and "Span" on page 285 will change.

Stop Freq also sets the frequency entry mode to **Start** or **Stop**. In **Start** or **Stop** mode, the start frequency and stop frequency values are displayed below the graticule, and the default active function in the **Frequency** menu is **Start Freq**.

Remote Command	`[:SENSe]:FREQuency:STOP <freq>` `[:SENSe]:FREQuency:STOP?`
Example	`:FREQ:STOP 220 MHz` `:FREQ:STOP?`
Notes	Preset and Max values depend on Hardware Options
Dependencies	By direct entry: – You cannot set **Start Freq** > **Stop Freq** – You cannot set **Start Freq** = **Stop Freq** – You cannot select Zero Span by setting **Start Freq** = **Stop Freq** – You cannot set **Start Freq** to a value that would create a span of less than 10 Hz If you try to do any of the above, **Stop Freq** changes to maintain a minimum of 10 Hz for the difference between **Start Freq** and **Stop Freq** With the knob or step keys: You cannot increment **Start Freq** to a value greater than **Stop Freq** – 10 Hz. If already in **Zero Span**, you cannot increment at all, and the first decrement is forced to at least 10 Hz **Stop Freq** can be limited by **Span** limits, if **Start Freq** is above its preset value If the electronic/soft attenuator is enabled, any attempt to set **Stop Freq** >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning If "Source Mode" on page 456 is set to **Tracking**, and the Max or Min **Start Freq** is therefore limited by the limits of the source, a warning message is generated, "Data out of range; clipped to source

	max/min" if these limits are exceeded. Note that for an external source, these limits can be affected by the settings of Source Numerator, Source Denominator, and Power Sweep
Couplings	The four parameters **Center Frequency**, **Start Freq**, **Stop Freq** and **Span** are interdependent, as changing one necessarily affects one or more of the others. The couplings between **Center Frequency** and **Span** are detailed under the control descriptions for those controls. These couplings also affect **Start Freq** and **Stop Freq**
Preset	On **Mode Preset**, **Span** and **Center Frequency** preset, and **Stop Freq** is derived. See **Center Frequency Presets** in "Center Frequency" on page 279 for the **Stop Freq** after Preset for various model and option numbers On **Meas Preset**, only **Span** presets, but **Center Frequency** does not, so **Stop Freq** will vary depending on **Center Frequency** When **Mode Preset** is performed while in External Mixing, the **Stop Freq** of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table for the current mixer setup If the current measurement has a limited **Span** available to it, and cannot achieve the **Span** shown in the table (**Span** = **Stop Freq** – **Start Freq**), the instrument uses the maximum **Span** the measurement allows, and sets **Center Frequency** to the midpoint of the **Start Freq** and **Stop Freq** values in the Harmonic Table. Thus, in this case, **Stop Freq** presets to a frequency above the preset **Center Frequency** by ½ of the maximum **Span** When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A, whose Stop frequency is 40 GHz Therefore, after **Restore Input/Output Defaults**, if you switch to External Mixing and do **Mode Preset** while in the Spectrum Analyzer Mode, the resulting **Stop Freq** is 40 GHz
State Saved	Saved in instrument state
Min	-79.999990 MHz, unless **Source Mode** is set to **Tracking**, in which case it is limited by the minimum frequency of the Source **Instrument Types** — **Min Value** VXT models M9421A — 55.000010 MHz VXT models M9410A/11A — 330.000010 MHz VXT models M9410A/11A — With Option LFE: 6.510 kHz; Without Option LFE: 330.000010 MHz VXT models M9415A — 330.000010 MHz M8920A — 80.010 kHz If the knob or step keys are being used, depends on the value of the other three interdependent parameters While in External Mixing, the minimum **Stop Freq** you can set is determined by the external mixing parameters. It will be close to the minimum LO frequency (3.8 GHz if undoubled, 8.6 GHz if doubled) times the harmonic number, for the lowest harmonic range in the Harmonic Table for the current mixer setup. It can be queried with `:FREQ:STOP? MIN`
Max	Depends on instrument maximum frequency. Note that, if **Source Mode** is set to **Tracking**, the effective instrument maximum frequency may be limited by the source maximum frequency If the knob or step keys are being used, depends on the value of the other three interdependent

	parameters While in External Mixing, the maximum **Stop Freq** you can set is determined by the external mixing parameters. It will be close to the maximum LO frequency (7 GHz if undoubled, 14 GHz if doubled) times the harmonic number, for the highest harmonic range in the Harmonic Table for the current mixer setup. It can be queried with `:FREQ:STOP? MAX`
Annotation	Stop <value> appears in the lower right corner of the display. This replaces Span <value>
Status Bits/OPC dependencies	Non-overlapped

Auto Tune

The purpose of **Auto Tune** is to quickly take you to the most likely signal of interest, and position it optimally on the display. When pressed, it causes the instrument to change its "Center Frequency" on page 279 to the strongest signal in the tunable span of the instrument, and sets **Ref Level** based on the strength of that signal.

This is an immediate action control, with no configurable parameters. It operates based on preset values based on real world situations.

NOTE **Auto Tune performs a Preset as part of its function. It leaves you in your current View and leaves the AC/DC coupling and Single/Cont state unaffected, but it resets most other measurement parameters.**

NOTE **You will see an hourglass, and you may see a slight pause, until the signal of interest is presented at midscreen.**

Remote Command	`[:SENSe]:FREQuency:TUNE:IMMediate`
Example	`:FREQ:TUNE:IMM`
Dependencies	**Auto Tune** is not available (grayed-out) when "Source Mode" on page 456 = **Tracking**

Zoom Center

Allows you to change the frequency of the zoom region, and hence of the lower window, without changing Zoom Span, when you are in **Swept Span**.

The **Zoom Center** value is displayed in the lower left corner of the zoom window (below the graticule) when the frequency entry mode is Center/Span (pressing "Center Frequency" on page 279 or "Span" on page 285 sets the frequency entry mode to Center/Span). When the frequency entry mode is Start/Stop, **Zoom Start** is displayed in this lower left annotation position (pressing "Start Freq" on page 290 or "Stop Freq" on page 292 sets the frequency entry mode to **Start/Stop**).

Remote Command	`[:SENSe]:FREQuency:TZOom:CENTer <frequency>` `[:SENSe]:FREQuency:TZOom:CENTer?`
Example	`:FREQ:TZO:CENT 20 MHz`
Dependencies	Only appears if the **Zoomed Trace** window is visible Grayed-out in **Zero Span**. If the SCPI command is sent in **Zero Span**, an error is reported
Couplings	The center frequency for the lower window is limited by the start and stop frequencies in the upper window. You cannot move the zoom region out of the upper window, nor does changing the **Zoom Center** frequency ever change the **Zoom Span**. When **Zoom Center** increases or decreases to a value that causes the zoom region to touch an edge of the top window, the **Zoom Center** is clipped at that value. If the instrument Start and/or Stop frequencies change such that the Zoom Region is no longer between them, the Zoom Region is moved to the far left or right of the top window as appropriate Affected by "Freq Offset" on page 299, exactly the same as is **Center Frequency**
Preset	On entry to Trace Zoom, the **Zoom Center** frequency is the same as the instrument **Center Frequency**. So, if you do **Mode Preset** and then immediately go into Trace Zoom, **Zoom Center** matches the Preset values listed in the table under the **Center Frequency** control description
State Saved	Saved in instrument state
Min	Start Frequency of top window
Max	Same as the maximum instrument **Center Frequency**, which is basically the instrument maximum frequency –5 Hz. See the table under **Center Frequency**
Annotation	In the Center Freq position of the Zoom Window

Zoom Span

Allows the span of the zoom region to be changed without changing the zoom center.

The center frequency for the lower window is limited by the start and stop frequencies in the upper window. You cannot move the zoom region out of the upper window. Consequently, if the zoom region hits either the left or right edge of the upper window, **Zoom Span** starts to shrink to keep the zoom region from going outside the upper window.

The **Zoom Span** value is displayed in the lower right corner of the zoom window (below the graticule) when the frequency entry mode is Center/Span (pressing "Center Frequency" on page 279 or "Span" on page 285 sets the frequency entry mode to Center/Span). When the frequency entry mode is Start/Stop, **Zoom Start** is displayed in this lower left annotation position (pressing "Start Freq" on page 290 or "Stop Freq" on page 292 sets the frequency entry mode to **Start/Stop**).

Remote Command	`[:SENSe]:FREQuency:TZOom:SPAN <frequency>` `[:SENSe]:FREQuency:TZOom:SPAN?`
Example	`:FREQ:TZO:SPAN 20 MHz`
Notes	As **Zoom Span** increases, if the edge of the zoom region hits either edge of the graticule, then as **Zoom**

	Span continues to increase, "Zoom Center" on page 294 changes to keep the zoom region from leaving the upper window
Dependencies	Only appears if the **Zoomed Trace** window is visible Grayed-out in **Zero Span**. If the SCPI command is sent in **Zero Span**, an error is reported
Preset	On entry to Trace Zoom, **Zoom Span** is 10% of the span of the upper window. So, if you do **Mode Preset** and then immediately switch to Trace Zoom, **Zoom Span** is 10% of the Span Preset value listed in the table under **Span**
State Saved	Saved in instrument state
Min	10 Hz
Max	Constrained by the top window (instrument) span. It cannot get so large that Zoom Start goes below the instrument **Start Freq**, or so that Zoom Stop goes above the instrument **Stop Freq**. Thus, the limit is 2*(**Zoom Center – Start Freq**) or 2*(**Stop Freq – Zoom Center**), whichever is smaller
Annotation	In the Span annotation spot of the lower window
Status Bits/OPC dependencies	non-overlapped

Zone Center

Allows you to change the frequency of the zone without changing the zone span. As **Zone Center** is changed, the center frequency of the lower window is changed. Note that the lower window is not updated to reflect the change unless it is selected as the active window.

The center frequency for the lower window is not limited by the selected start and stop frequencies in the upper window. However, if the frequency span of the lower window is at all outside of the span for the upper window, an orange arrow pointing left or right is displayed at the left or right edge of the top window.

Remote Command	`[:SENSe]:FREQuency:ZSPan:CENTer <frequency>` `[:SENSe]:FREQuency:ZSPan:CENTer?`
Example	`:FREQ:ZSP:CENT 20 MHz`
Notes	Min and Max values depend on Hardware Options
Dependencies	Only appears if the **Zone Spectrum** window is visible
Couplings	Center Frequency of lower window changes so that it is always the same as **Zone Center**, and vice-versa Affected by Freq Offset exactly the same as is Center Frequency
Preset	On entry to Zone Span, the **Zone Center** frequency is the same as the instrument **Center Frequency**. So, if you do **Mode Preset** and then immediately switch to Zone Span, **Zone Center** matches the Preset values listed in the table under **Center Frequency**
State Saved	Saved in instrument state
Min	Hardware dependent; Zone Span dependent

	Zone Center cannot go so low as to force Zone Left to be <0
Max	The maximum **Zone Center** frequency is the same as the maximum instrument **Center Frequency**, which is basically the instrument maximum frequency –5 Hz. See the table under **Center Frequency**
Annotation	As the Center Freq of the Zone Window
Status Bits/OPC dependencies	Non-overlapped

Zone Span

Allows the span of the zone markers to be changed without changing the center frequency. The zone markers are vertical lines marking the zone in the upper window. They determine the frequency range displayed in the lower window. As the zone markers are moved, the span of the lower window is changed but the lower window will not be updated to reflect the change unless it is selected as the active window.

The span limit of the lower window is the same as the span limit of the instrument. The span for the lower window is not limited to the selected span of the upper window. However, if the frequency span of the lower window is at all outside of the span for the upper window, an orange arrow pointing left or right is displayed at the left or right edge of the top window.

Remote Command	`[:SENSe]:FREQuency:ZSPan:SPAN <frequency>` `[:SENSe]:FREQuency:ZSPan:SPAN?`
Example	`:FREQ:ZSP:SPAN 20 MHz` `:FREQ:ZSP:SPAN?`
Notes	Min and Max values depend on Hardware Options
Dependencies	Only appears if the **Zone Spectrum** window is visible Only appears in the **Zone Span** View in measurements that support this View. If the command is sent in other Views, generates an error
Couplings	Span of lower window changes so that it is always the same as **Zone Span**, and *vice versa*
Preset	On entry to the Zone Span View, **Zone Span** is 10% of the span of the upper window. So, if you do **Mode Preset** and then immediately switch to Zone Span, **Zone Span** is 10% of the Span Preset value listed in the table under **Span**
State Saved	Saved in instrument state
Min	0 Hz
Max	Cannot go so high as to force the zone region outside the top window
Annotation	As the Span of the Zone Window
Status Bits/OPC dependencies	Non-overlapped

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>` `[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`

Example	Increase the current center frequency value by 500 MHz:
	`:FREQ:CENT:STEP 500 MHz`
	`:FREQ:CENT UP`

Notes	Preset and Max values depend on Hardware Options
Dependencies	Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Couplings	When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span. When auto-coupled in **Zero Span**, the center frequency step size is set to the equivalent -3 dB RBW value
Preset	Auto
State Saved	Saved in instrument state
Min/Max	–/+ (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Auto Function

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1` `[:SENSe]:FREQuency:CENTer:STEP:AUTO?`
Example	`:FREQ:CENT:STEP:AUTO ON` `:FREQ:CENT:STEP:AUTO?`
Preset	`ON`

Freq Offset

Lets you set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a **Mode Preset**, or set **Freq Offset** to 0 Hz.

For further details, see "More Information" on page 299.

Remote Command	`[:SENSe]:FREQuency:OFFSet <freq>` `[:SENSe]:FREQuency:OFFSet?`
Example	`:FREQ:OFFS 10 MHz` `:FREQ:OFFS?`
Notes	Preset and Max values depend on Hardware Options
Dependencies	Not available in External Mixing. In this case, the **Freq Offset** control is grayed-out and shows a value of zero. However, the value of CF Offset that was set for the RF Input is retained and restored when you switch back to the RF Input Not available when the frequency scale is set to `LOG`, or when segmented sweep is enabled
Preset	See **Center Frequency Presets** in "Center Frequency" on page 279
State Saved	Saved in instrument state
Min	-500 GHz
Max	500 GHz
Annotation	If Frequency Offset is not zero, "Freq Offset <value>" appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped
Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:X[:SCALe]:OFFSet`
Backwards Compatibility Notes	The `DISPlay` version of the command is in the instrument for compatibility across platforms and is not recommended for new development

More Information

This command does not affect any bandwidths or the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by Freq Offset. Changing the offset, even on a trace that is not updating will immediately change all of the above, without taking new data.

NOTE **If a trace is exported with a nonzero Freq Offset, the exported data will contain the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want Freq Offset to be 0, or the offset would be applied again to data that is already offset. No such care need be taken when saving a State+Trace file because the data and state are saved together.**

X Axis Scale Log | Lin

Selects either `LINear` or `LOGarithmic` scaling for the frequency axis.

The scaling can be changed at any time and determines only how the data is displayed; it has no impact on the actual sweep or measurement of trace data (with the exception that the detector auto-rules never select the `NORMal` **Detector** while in `LOGarithmic` Scale Type). Changing the scaling does not restart the sweep (unless the detector changes) and has no impact on the number of sweep points. The scaling can be changed while traces are in view, and they will scale appropriately. Markers stay at their set frequency, so they may move on the display.

Note that the actual trace data does not change as you go between Log and Linear Scale Type; hence trace data saved while the display is in log will look identical to trace data saved while the display is in linear. When recalling trace data, the current value of Scale Type is used to display the data. (**Trace +State** files will of course recall with whatever Scale Type setting was in effect when they were saved, since the State is saved with them).

This function has no effect on the **Zero Span** display, although it is available while in **Zero Span**.

See "More Information" on page 301

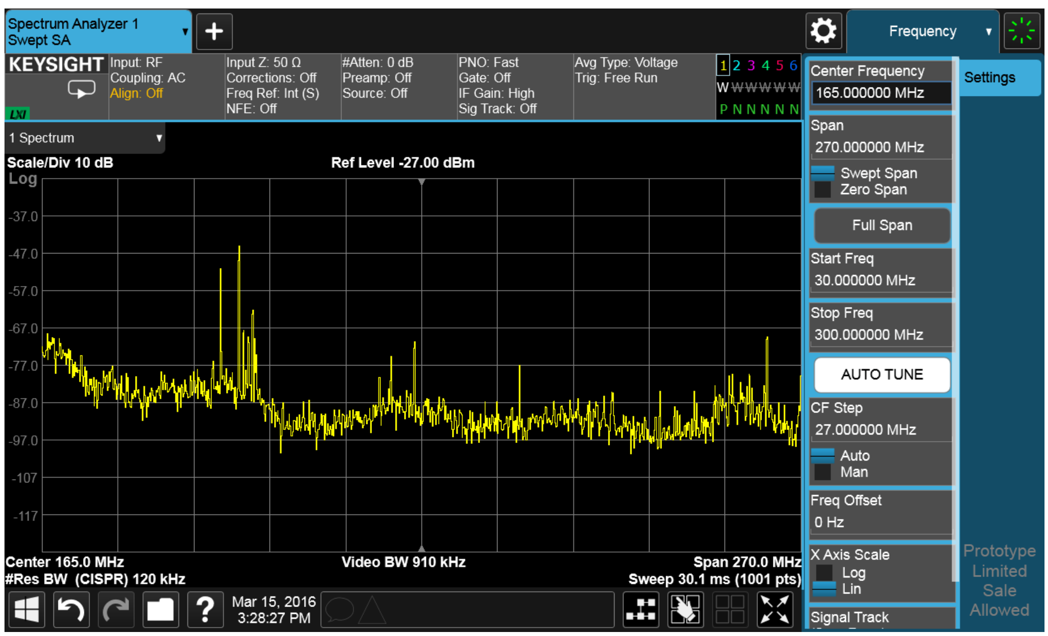
Remote Command	`:DISPlay:WINDow[1]:TRACe:X[:SCALe]:SPACing LINear | LOGarithmic` `:DISPlay:WINDow[1]:TRACe:X[:SCALe]:SPACing?`
Example	`:DISP:WIND:TRAC:X:SPAC LOG`
Dependencies	Has no effect in **Zero Span**, but if changed while in **Zero Span**, will be changed on returning to non-zero span The `NORMal` **Detector** is never selected by the detector auto-rules while in `LOG`, the rules select `SAMPle` if `NORMal` would have been selected
Couplings	In `LINear`, the Frequency controls and notation at the bottom of the screen default to Center/Span. In `LOGarithmic`, they default to Start/Stop. When switching from `LINear` to `LOGarithmic`, the notation at the bottom of the screen changes to Start/Stop, and, if the active function was one of the

	frequency controls (**Center Frequency**, **Start Freq**, **Stop Freq**, or **Span**), it changes to **Start Freq**. When switching from `LOG` to `LIN`, the notation at the bottom of the screen changes to Center/Span, and if the active function was one of the frequency controls (**Center Frequency**, **Start Freq**, **Stop Freq**, or **Span**), it changes to **Center Frequency** When switching to `LOG`, if **Start Freq** is 0 Hz, it is changed to 10 Hz
Preset	`LIN`
State Saved	Saved in Instrument State
Backwards Compatibility SCPI	`[:SENSe]:SWEep:SPACing LINear | LOGarithmic`

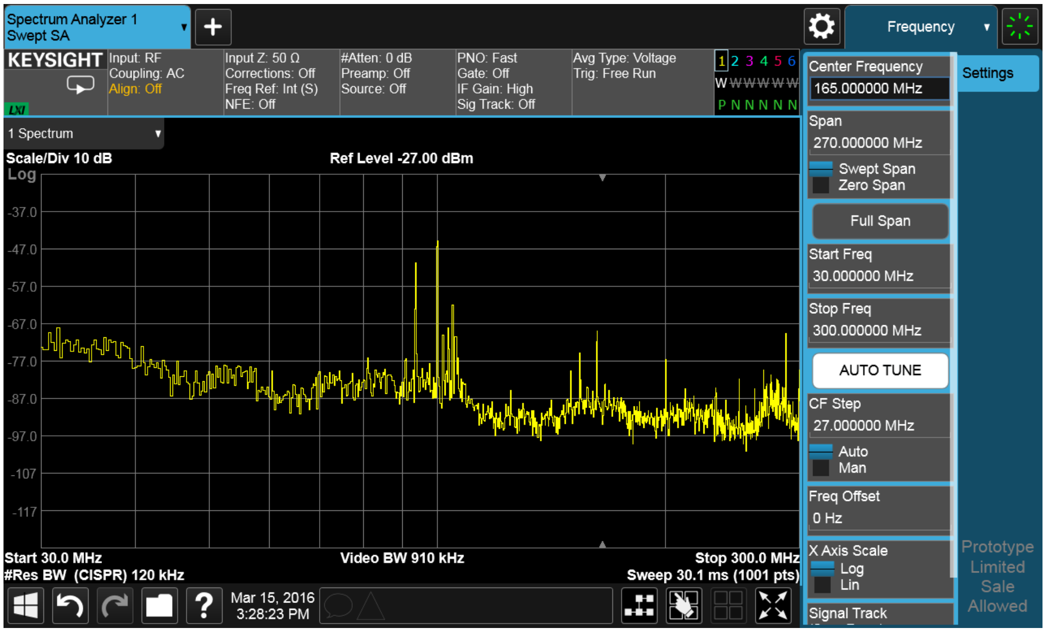
More Information

The log graticule is drawn to optimize the display based on the range of frequencies being shown. The center frequency is marked with a small triangle at the top and bottom of the display, regardless of whether the scaling is log or linear.

The center frequency mark in Linear Scale Type is in the center of the display:



Center Freq mark in Log Scale Type is to the right of center:



Signal Track (Span Zoom)

When Marker 1 is placed on a signal, and **Signal Track** is pressed, the marker remains on the signal while the instrument retunes the center frequency to the marker frequency. The instrument keeps the signal at the center of the display, as long as the amplitude of the signal does not change by more than +/–3 dB from one sweep to another. If **Marker 1** is not in **Normal** or **Delta**, turning on **Signal Track** sets it to **Normal**, performs a peak search, and centers the marker on the display.

See "More Information" on page 303.

Remote Command	`:CALCulate:MARKer:TRCKing[:STATe] OFF | ON | 0 | 1` `:CALCulate:MARKer:TRCKing[:STATe]?`
Example	Turn on **Signal Track** using Marker 1: `:CALC:MARK:TRCK ON`
Dependencies	Not available (grayed-out) when the **Waterfall** window is visible Associated with **Marker 1**. When Marker 1 is **Off**, or set to **Fixed**, **Signal Track** is also turned off Not available (grayed-out) when **Source Mode** = **Tracking** Not available (grayed-out) when Signal ID = on **Signal Track** and **Continuous Peak Search** cannot be used with each other. If one is on, the other is grayed-out **Signal Track** is grayed-out if in **Zero Span** But if **Zero Span** is entered while in **Signal Track**, **Signal Track** is turned off Can only function properly if the trace Marker 1 is on is updating. Therefore, if **Signal Track** is on and

	the trace Marker 1 is on is put into view, **Signal Track** is turned off and the **Signal Track** control grayed-out. Whenever the trace Marker 1 is on is not updating, the **Signal Track** control is grayed-out Only available in the Swept SA measurement
Couplings	Can only function properly if the trace Marker 1 is on, is in Trace Update = Active. Therefore, if the trace Marker 1 is in Update = Off when **Signal Track** is turned on, it is changed to Update = On. If the trace Marker 1 is set to Update = Off while **Signal Track** is on, it turns off **Signal Track**
Preset	`OFF`
State Saved	Saved in instrument state
Annunciation	"Sig Track: On" appears in the Meas Bar

More Information

If Marker 1 is **Off** when Signal Track is turned on, marker 1 is turned on in the center of the screen and a peak search is performed. If marker 1 is already on, it stays on and is used where it is. If it is **Fixed**, it is set to **Normal**.

If you move the marker during **Signal Track**, a **Mkr-> CF** is performed, and the signal track function starts over.

If the signal is lost, an attempt is made to find it again and continue tracking. If there are other signals on screen that are near the same amplitude, one of them may be found instead since the algorithm is seeking a signal with amplitude similar to the amplitude of the original signal.

Signals near 0 Hz cannot be tracked effectively as they cannot be distinguished from the LO feed-through, which is excluded by intent from the search algorithm.

As a speed optimization, the center frequency is only changed if it differs from the marker position by 1% or more of the span.

If the instrument is in Single Sweep and Signal Track is turned on, then nothing happens until a sweep is actually initiated (that is, by `:INIT:IMM` or **Single** key, and a trigger). Once the sweep is initiated, the entire set of sweeps necessary to complete a pass through the signal track algorithm ensues before the instrument returns `*OPC` true, returns results to `:READ` or `:MEASure`, or returns to the idle state.

If **Span** is changed while in **Signal Track**, either by you, or because moving the instrument to the signal frequency results in Span Limiting (as described under **Frequency**), an "auto-zoom" algorithm is executed to get to the new span without losing the signal. In "auto zoom", the span is reduced in stages, with a sweep between each stage. You will see this zooming occur as each sweep is performed, and the new span is set. When auto-zooming, the set of steps necessary to achieve the target span is to be considered a "measurement," thus the entire process executes even if the instrument is in single sweep. `*OPC` will not return true until the process is complete, nor will results be returned to `:READ` or `:MEASure` queries. Note further that if the instrument is in a measurement such as averaging when this happens, the act of changing the span restarts averaging but the first average trace is the last trace of the auto zoom.

This function is intended to track signals with a frequency that is changing (drifting), and an amplitude that is not changing. It keeps tracking if you are in continuous-sweep mode. If in single-sweep mode, as described above, the instrument only does one center frequency adjustment as necessary.

Last Span (Remote Command Only)

Changes the displayed frequency span to the previous span setting. If this command is sent immediately after **Signal Track** is turned `OFF`, then the span setting returns to the span that was in effect before **Signal Track** was turned on.

If this command is sent while in a non-zero span, and the previous value of span was 0, it returns the instrument to **Zero Span**. If it is sent while in **Zero Span**, it returns the instrument to its last non-zero span.

Sending this command places the instrument in Center/Span frequency entry mode.

Remote Command	`[:SENSe]:FREQuency:SPAN:PREVious`
Example	Set the span to the previous value: `:FREQ:SPAN:PREV`
Dependencies	If the electrical attenuator is enabled, any attempt to set **Span** such that **Stop Freq** would be >3.6 GHz results in an error Turns off segmented sweep

3.2.7 Marker

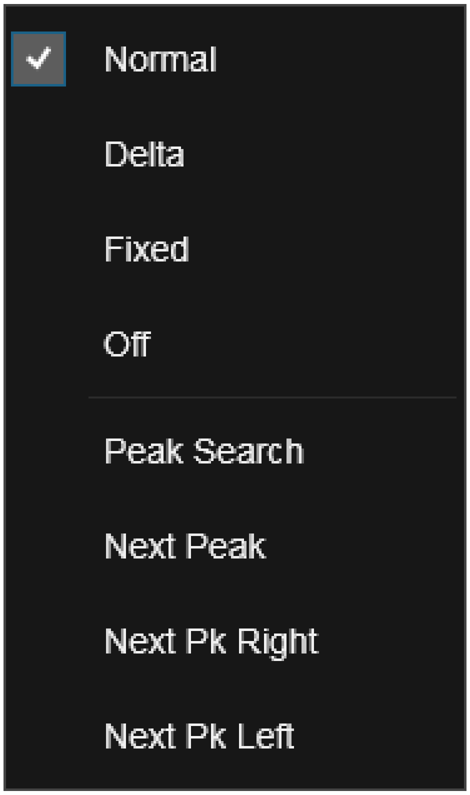
Accesses the **Marker** menu. A marker can be placed on a trace to allow the value of the trace at the marker point to be determined precisely.

The fundamental marker operation involves setting a Marker's X-Axis value and then reading the marker's Y-Axis value. From the front panel you do this using the **Marker** menu, the knob and the green marker readout in the upper right corner of the display.

Markers may also be used in pairs to read the difference (or delta) between two data points. They can be used in Marker Functions to do advanced data processing, or to specify operating points in functions like Signal Track and N dB Points.

Marker Right-Click Menu

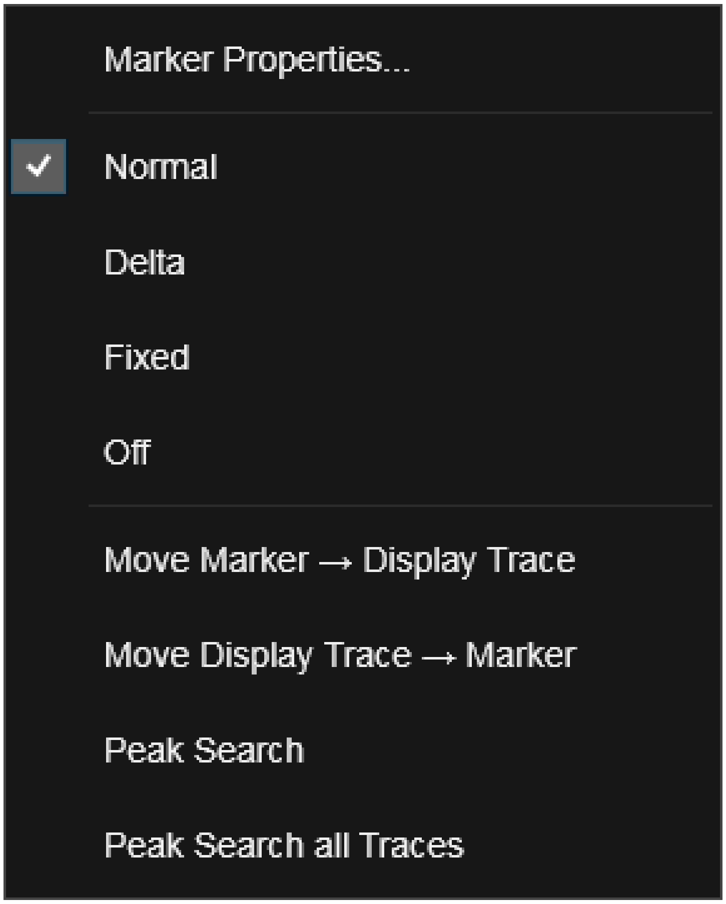
If you right-click on a marker (or touch and hold a marker and wait for the circle to close) you will see this menu:



If you tap or click on one of the menu items, it will perform the corresponding function:

- Normal, Delta, Fixed or Off set the Marker Mode (see "Marker Mode" on page 312)
- Peak Search, Next Peak, Next Pk Right or Next Pk Left move the Marker to the appropriate peak (see "Peak Search" on page 317)

If you right-click on a marker (or touch and hold a marker and wait for the circle to close) in the **Waterfall** window (for example, in the **Spectrogram** View) you will see this menu:



- Normal, Delta, Fixed and Off work as for the standard menu above
- Marker Properties opens the Marker Properties tab (see "Properties" on page 333). Move Marker -> Display Trace and Move Display Trace -> Marker work the same way as the corresponding buttons in the Marker -> menu (see "Marker To" on page 368)
- Peak Search finds the highest peak on the current Display Trace
- Peak Search all Traces finds the highest peak in the Waterfall window (see "Peak Search All Traces" on page 319)

NOTE In earlier HP/Agilent/Keysight analyzers, markers stayed at the same position on the display even when you changed frequency. In the X-Series, markers stay at the frequency they are set to, even if you change Center Frequency. So, your marker will move, possibly offscreen, when you change frequency. This is a superior method for a number of reasons, but it may take some getting used to if you are used to placing a marker at center screen and then changing Center Frequency and having the marker stay there. See "Marker Backwards Compatibility" on page 308 for more on this.

NOTE: Markers can be on and not be visible if they are offscreen. This may occur if you set a marker to a frequency outside of the current settings of the Start and Stop frequencies, or in **Spectrogram** View, you place a marker on a Display Trace other than 0. To move the marker on to the display, press the **Peak Search** hardkey.

3.2.7.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker is affected when you change marker settings, perform a **Peak Search**, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. Select Marker is blanked if you select a tab whose controls do *not* depend on the selected marker (for example., **Counter**).

For any menu that includes **Select Marker**, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the **Marker** menu and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal, Delta** and **Fixed** markers

3.2.7.2 Settings

The controls on this tab include the **Marker** active function and a radio button selection for the marker control mode (**Normal**, **Delta**, **Fixed**, or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency | Time

This is the fundamental control that you use to move a marker around on the trace. It is the default active function in the **Marker** menu, so all you need to do is press **Marker** and turn the knob to move the marker left and right on the display. This is always the first control on any **Marker** menu page that follows the Selected Marker.

When in **Zero Span** (for measurements that support **Zero Span**), the label on this control changes to **Marker Time**. When Marker Mode is **Delta**, the label changes to **Marker Δ Frequency** or **Marker Δ Time**.

The remote command sets the marker X-Axis value in the current marker X-Axis Scale unit. The marker that is addressed becomes the selected marker. It has no effect (other than to cause the marker to become selected) if the control mode is **Off**, *but* it is the SCPI equivalent of entering an X value if the control mode is **Normal,Delta,** or **Fixed**.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:X <freq | time>` `:CALCulate:MARKer[1]|2|…|12:X?`

Example	Turn on Marker 2 as a **Normal** marker
	`:CALC:MARK2:MODE POS`
	Move Marker 2 to 20 GHz:
	`:CALC:MARK2:X 20 GHZ`
	Query the amplitude of Marker 2:
	`:CALC:MARK2:Y?`

Notes	If no suffix is sent, **Marker Frequency | Time** uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an invalid suffix message is generated If the specified marker is **Fixed**, and a Marker Function is on, a message is generated. If the control is pressed, an advisory message is generated. If the equivalent SCPI command is sent, this same message is generated as part of a "–221, Settings conflict" warning The query returns the marker's absolute X Axis value if the control mode is **Normal** or **Fixed**. It returns the offset from the marker's reference marker if the control mode is **Delta**. The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and **Inverse Time**, seconds for **Period** and **Time**. If the marker is **Off**, the response is Not a Number The Marker Amplitude query is discussed under "Marker Amplitude" on page 310
Dependencies	Grayed-out, and displays three dashes for the value, when the selected Marker is **Off** You cannot directly set the X value of a **Fixed** marker that has a marker function turned on If an attempt is made to adjust it while a Marker Function is on, a warning message is generated
Preset	After preset, if X is queried with no value sent first, the center of screen value is returned. The actual value depends on the frequency range of the instrument
Min/Max	–/+¥ (minus infinity) Unlike legacy analyzers, where the markers were forced to be on screen, X-Series marker values are not limited and do not clip

Marker Backwards Compatibility

– In earlier HP/Agilent/Keysight analyzers, markers were position markers, which means that **Normal** and **Delta** markers stayed at the same screen position when X Axis parameters were changed. So, a marker at center screen stayed at center screen even if **Center Frequency** was changed (which means that the marker's frequency changed). In the X-Series, markers are value markers, which means that when the instrument's X Axis settings are changed, the marker's X Axis value in fundamental X Axis units remains unchanged. For example, if you put a marker at a particular frequency, it will stay at that frequency regardless of whether you change the instrument **Center Frequency**, even if that means that the marker ends up offscreen

- While this change resulted in an overall higher level of usability of the marker system, there are some use cases where the user depends on the marker staying at the center of the screen. The most common one is where the user turns on a marker at center screen and uses it to measure the trace amplitude at the center frequency or at a series of center frequencies, without the need to ever move the marker. In the X-Series, to mimic the legacy behavior for this use case, you must turn the marker off and then back on after changing the center frequency of the instrument. This causes the marker to reappear in the center of the screen
- Also, as a result of the change from position markers to value markers, markers can be at a frequency that is offscreen, whereas in the past, they were clipped to the screen edges and hence were never offscreen. If your remote programming depended on this clipping behavior to force markers to the edges of the screen, you will need to modify the code. Furthermore, since markers could never be offscreen they always returned a valid result. In the X-Series, markers that are offscreen return Not a Number as a result; hence the potential now exists for Not a Number to be returned for a marker query

Setting the Marker X Position in Trace Points

Sets the marker X position in trace points. It has no effect if the marker control mode is **Off**, but it is the SCPI equivalent of entering a value if the control mode is **Normal**, **Delta**, or **Fixed** – except the setting is in trace points rather than X-Axis Scale units.

NOTE	The entered value in Trace Points is immediately translated into the current X Axis Scale units for setting the value of the marker. The marker's value in X Axis Scale Units, *not* trace points, is preserved if a change is made to the X Axis scale settings. Thus, if you use this command to place a marker on bucket 500, which happens at that time to correspond to 13 GHz, and then you change **Start Freq** so that bucket 500 is no longer 13 GHz, the marker will stay at 13 GHz, *not* at bucket 500! This is important to realize as it differs from the behavior of past HP/Agilent/Keysight analyzers.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:X:POSition <real>` `:CALCulate:MARKer[1]|2|…|12:X:POSition?`
Notes	If the specified marker is **Fixed**, and a Marker Function is on, a message is generated. If the control is pressed, an advisory message is generated. If the equivalent SCPI command is sent, this same

	message is generated as part of a "–221, Settings conflict" warning The query returns the marker's absolute X Axis value in trace points if the control mode is **Normal** or **Fixed**. It returns the offset from the marker's reference marker in trace points if the control mode is **Delta**. The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points The Max value shown in this table, just like the Preset value, is for the case where the number of trace points set for the measurement is 1001
Preset	After preset, if X is queried with no value sent first, the center-of-screen value is returned. So, if per default, the number of Trace points is 1001, the returned value will be 500
Min	0
Max	Number of trace points – 1
Backwards Compatibility SCPI	`:CALCulate:MARKer[1]|2|…|4:X:POSition:CENTer`

Marker Amplitude

Sets or returns the Y-Axis value of the specified marker.

When "Marker Mode" on page 312 is **Fixed**, a **Marker Amplitude** control also appears on the menu panel, and you can set the marker amplitude directly.

The SCPI command is primarily used to query the Marker's X-Axis value. In the command form, it selects the marker and sets the marker Y Axis value; the default unit is the current Y Axis unit. The command has no effect (other than selecting the marker) unless the marker control mode is **Fixed**. No error is generated if the marker is not **Fixed**, but no action is taken, either.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:Y <real>` `:CALCulate:MARKer[1]|2|…|12:Y?`

Example	Query the amplitude of Marker 3:
	`:CALC:MARK3:Y?`
	Move marker 3 to a Y value of 0 dBm:
	`:CALC:MARK3:Y -10 dBm`

Notes	`:CALCulate:MARKer[1]|2|3|4|5|6|7|8|9|10|11|12:Y?` returns the marker Y-axis result, either absolute or delta, in the current Y axis Unit, if the control mode is **Normal, Fixed**, or **Delta**. If the marker is **Off** the response is 9.91e37 (Not a Number) For the command version (only used for **Fixed** markers), if no suffix is sent, uses the current Y Axis unit. If a suffix is sent that does not have units of absolute amplitude, an invalid suffix error is generated. If a marker function is on for the specified marker, a Settings Conflict message is generated
Dependencies	You cannot directly set the Y value of a **Fixed** marker that has a marker function turned on If an attempt is made to adjust it while a Marker Function is on, a warning message is generated

	You cannot directly set the Y value of a **Fixed** marker while **Normalize** is turned on. If an attempt is made to do so while **Normalize** is on, a warning message is generated
Preset	Trace value at center of screen. There is no way to predict what this will be after a preset
Min/Max	–/+ ∞ (minus/plus infinity)
Backwards Compatibility Notes	As a result of the change from position markers to value markers (see below), markers can be at a frequency which is offscreen, whereas in the past, they were clipped to the screen edges and hence were never offscreen. In the past, since markers could never be offscreen, they always returned a valid result. In X-Series, markers that are offscreen return Not a Number as a result; hence the potential now exists for Not a Number to be returned for a marker Y-Axis query

Marker Z

In the **Spectrogram** View, the marker takes on a third dimension, which we refer to as **Marker Z**. In this case, a **Marker Z** control appears on the menu panel. You can use **Marker Z** to choose on which trace in a historical set of traces you want to place the Marker.

This command sets the **Marker Z** position in the **Spectrogram** View only. Setting the Z position sets which of the many traces in the **Spectrogram** the selected marker will appear on. In each case the marker that is addressed becomes the selected marker. It has no effect (other than to cause the marker to become selected) if the control mode is **Off**, but is the SCPI equivalent of making a **Marker Z** entry if the control mode is **Normal,Delta**, or **Fixed**.

The **Marker Z** position cannot be set above the maximum trace in the **Spectrogram** window and, unlike the Marker X position, will not move off screen in the **Spectrogram** Window if the storage size is smaller than the number of traces that can be viewed.

If **Spectrogram** is ON, the marker result block has a third line displaying the time value of **Marker Z**. If the marker is a **Delta** marker, the delta time value is displayed. Although the Z marker position can be moved to trace 0, this is not recommended, as the current trace value is constantly being updated by new acquisitions and therefore the Z time value for trace 0 is not completely registered until the trace is completed.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:Z:POSition <integer>` `:CALCulate:MARKer[1]|2|…|12:Z:POSition?`

Example	Set Marker 2 to **Fixed**:
	`:CALC:MARK2:MODE FIX`
	Put Marker 2 on Trace 150:
	`:CALC:MARK2:Z:POS 150`

Notes	Sets or queries the Z Axis position. In the **Spectrogram** View, this value correlates to be one of the 300 stored traces. Each Z Axis position represents a different stored trace

Preset	0
Min	0
Max	Number of traces stored is limited to 300

Querying the Marker Z Axis Value (Remote Query Only)

Queries the Z-axis time value of the marker in the **Spectrogram** View only. The marker that is addressed becomes the selected marker.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:Z?`
Notes	Returns the marker's absolute Z Axis value if the control mode is **Normal** or **Fixed**. It returns the offset from the marker's reference marker if the control mode is **Delta** For **Spectrogram**, the Z Axis value represents the amount of time transpired since the start of the recording of traces
Dependencies	Only appears when the **Waterfall** window is visible, and either the **Waterfall** or **Spectrum** window is selected If the query is sent at any other time, it is accepted without error, but you will not see the result until you once again display the **Waterfall** window
Preset	9.91E+37
Min/Max	–/+Infinity

Marker Mode

There are four control modes for markers:

Normal	`POSition`	A marker that can be moved to any point on the X Axis by specifying its X Axis value, and whose absolute Y Axis value is then the value of the trace point at that X Axis value
Delta	`DELTa`	A marker that can be moved to any point on the X Axis by specifying its X Axis offset from a reference marker, and whose absolute Y Axis valueis then the value of the trace point at that X Axis value
Fixed	`FIXed`	A marker whose X Axis and Y Axis values may be directly or indirectly specified by you, but whose Y Axis value remains fixed, once specified, and does not follow the trace. Fixed markers are useful as reference markers for Delta markers, as operands in a Peak Search operation, and as arbitrary reference points settable by you. These markers are represented on the display by an "X" rather than a diamond. Not every measurement supports Fixed markers
Off	`OFF`	A marker that is not in use

For more details, see "More Information" on page 314.

The SCPI command in the table below selects the marker and sets the marker control mode as described under **Normal**, **Delta**, **Fixed** and **Off**, below. All interactions and dependencies detailed under the control description are enforced when the remote command is sent.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:MODE POSition | DELTa | FIXed | OFF` `:CALCulate:MARKer[1]|2|…|12:MODE?`
Example	`:CALC:MARK2:MODE POS` `:CALC:MARK:MODE?`
Notes	Two additional parameters, `SPAN` and `BAND`, are supported for backwards compatibility only and should *not* be used for new designs. Both the `SPAN` and `BAND` legacy parameters are aliased to `POSition`. They are never returned to a query. See "Band Function Backwards Compatibility" on page 343 for more information Upon receipt of this command, for any parameter except **Off**, if the selected marker was **Off**, it is set to the specified mode and placed at the center of the screen on the trace specified by the marker's Trace attribute
Couplings	The marker specified by this command becomes the selected marker on the front panel
Preset	`OFF` (all markers)
State Saved	The marker control mode (**Normal**, **Delta**, **Fixed**, **Off**) and X-Axis value are saved in instrument state
Annunciation	Annunciation in the marker result block in the upper-right corner of the display indicates the X-Axis value and Y-Axis result of the marker
Backwards Compatibility SCPI	`:CALCulate:MARKer[1]|2|…|12:STATe ON | 1`
Backwards Compatibility Notes	In legacy analyzers, only a Reference marker could be **Fixed**, and it was always **Fixed**. Additionally, it could not be moved. In X-Series, any marker can be set to **Fixed** and can be moved to any X or Y value Setting a marker that is `OFF` to `ON` (1) selects the marker, puts it in **Normal** mode and places it at the center of the screen Setting a marker that is not `OFF` to `ON` has no effect (does not change its control mode) The response to the query is `ON` unless the marker is `OFF` In pre-X-Series analyzers, pressing **Delta** (or sending `:CALC:MARK:MODE:DELTa`) always moved the reference marker to the **Delta** marker. Now it only does so if the marker was already a **Delta** marker

Notes	Provided for ESA/PSA backwards compatibility
Preset	`OFF`
Backwards Compatibility SCPI	`:CALCulate:MARKer[1]|2|…|12:STATe OFF | ON | 0 | 1` `:CALCulate:MARKer[1]|2|…|12:STATe?`

More Information

Value	SCPI	Notes
Normal	POS	A **Normal** marker can be moved to any point on the X Axis by specifying its X Axis value. Its absolute Y Axis value is then the value of the trace point at that X Axis value
Delta	DELT	In **Delta** mode, the marker result shows the relative result between the selected (Delta) marker and its reference marker. A **Delta** marker can be moved to any point on the X Axis by specifying its X Axis offset from a reference marker. Its absolute Y Axis value is then the value of the trace point at that X Axis value
Fixed	FIX	A **Fixed** marker is fixed in the sense that it stays where you place it. It can be directly moved in both X and Y. It can be moved by a **Peak Search**. It can also be indirectly moved by re-zeroing the delta, if it is a relative marker. If it is moved, it again becomes fixed at the X Axis point it moved to and it has a Y-axis result that it took on when it moved there. If a **Normal** or **Delta** marker is changed to **Fixed**, it becomes fixed at the X Axis point it was at, and with the Y-axis result it had when it was set to **Fixed** In **Fixed** mode, the marker result shows: – If no Marker Function is on, the absolute X Axis and Y axis value of the marker – If a Marker Function is on, the X Axis value and the Y-axis function result the marker had when it became **Fixed**
Off	OFF	Turns off the marker, removes the marker annunciation from the display, turns off any active function and any marker function, and resets the following properties to their default value: – X Axis scale: Auto – Band Span: 0 – Auto Trace: On **Off** does not affect which marker is selected

Setting Fixed Marker Values

Normal markers

When an X Axis value is entered, or set using the knob or step keys, the marker moves to the trace point nearest to that X Axis value. The value is retained in all its precision whether it is at the center of a trace point or not, and future increments are applied to that value.

Delta markers

When the **Delta** control is selected:

- If the selected marker was not already in **Delta** mode:

- the selected marker becomes a **Delta** marker
- If the marker's reference marker is off, it is turned on as a **Fixed** marker at the selected marker's X Axis value on the selected marker's trace and takes on the selected marker's X Axis value and Y-axis result. The reference marker's Trace attribute (including **Auto**, if on) becomes that of the selected marker. Note that if a marker function was on, the result that the reference marker then takes on is that of the function
- If the marker's reference marker was already on, it is unaffected
- If the selected marker was already in **Delta** mode: the reference marker is moved (even if **Fixed**), to the selected marker's trace at its X Axis value. The reference marker's Trace attribute (including **Auto**, if on) becomes that of the selected marker

When an X Axis value is entered, or set using the knob or step keys, the marker moves, relative to its reference marker, to the trace point nearest to that value. The value is retained in all its precision whether it is at the center of a trace point or not, and future increments are applied to that value.

Fixed markers

If the selected marker was **Off**, it is placed at the center of the screen on the trace specified by the marker's trace attribute (although subsequent sweeps will not affect its amplitude).

A **Fixed** marker is fixed in the sense that it does not follow the trace. You can directly move it in both X and Y directions, and it can also be indirectly moved. In the latter case, once it moves, it again becomes **Fixed** at the X Axis point it moved to and with the Y-axis result it took on when it moved there.

If a **Normal** or **Delta** marker is changed to **Fixed**, it becomes fixed at the X Axis point it was at and with the Y-axis result it had when it was set to **Fixed**.

When a Y Axis value is entered, or set using the knob or step keys, the marker moves vertically to the amplitude specified. When an X Axis value is entered, or set using the knob or step keys, the marker moves to the trace point nearest to that X Axis value. The value is retained in all its precision whether it is at the center of a trace point or not, and future increments are applied to that value. However, the Y Axis value of the marker does *not* take on that of the trace.

Delta Marker (Reset Delta)

Pressing this button has exactly the same effect as pressing the **Delta** selection in **Marker Mode**. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

Marker Table

When set to ON, the display is split into a measurement window and a marker data display window. For each marker that is on, information is displayed in the data display window, which includes the marker number, control mode, trace number, X axis scale, X axis value, and the Y-axis result. Additional information is shown for markers that have marker functions turned on.

Turning on **Marker Table** turns off "Peak Table On/Off" on page 329, and *vice versa*.

Remote Command	`:CALCulate:MARKer:TABLe[:STATe] OFF | ON | 0 | 1` `:CALCulate:MARKer:TABLe[:STATe]?`
Example	Turn on **Marker Table**: `:CALC:MARK:TABL ON`
Dependencies	Only available as a switch in the **Normal** View. **Marker Table** is also available as a selection in the **Window Data** dropdown in all Views
Preset	`OFF`
State Saved	The on/off state of **Marker Table** is saved in instrument state

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility, which displays all the markers at once.

The top row (labeled **Marker**) shows each of the 12 markers, with a label showing the Mode and also a visual representation of the Mode (diamond for **Normal** or **Delta**, X for **Fixed**, nothing for **Off**). The selected **Marker** has a blue outline and the figure in green.

The second row (labeled **Reference Marker**) shows the Reference Marker for each marker in the top row. If a marker in the top row is a **Delta** marker, an arrow points down to its Reference Marker. You can drag a top row marker down to any position in the bottom row to make it the reference marker for any other marker.

At the bottom is a large image of the **Selected Marker**, and dropdowns allowing you to change the Mode and Trace of the selected **Marker**. The **Marker Trace** number appears in the Trace color of the trace in question.

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:MARKer:AOFF`

Example	:CALC:MARK:AOFF
Couplings	In the Swept SA measurement, sets the selected marker to 1

Couple Markers

When this function is ON, moving any marker causes an equal X Axis movement of every other marker that is not **Fixed** or **Off**. By "equal X Axis movement", we mean that we preserve the difference between each marker's X Axis value (in the fundamental x-axis units of the trace that marker is on), and the X Axis value of the marker being moved (in the same fundamental x-axis units).

Note that **Fixed** markers do not couple. They stay where they were while all the other markers move. Of course, if a **Fixed** marker is *being* moved, all the non-fixed markers do move with it.

This may result in markers going off screen.

Remote Command	:CALCulate:MARKer:COUPle[:STATe] OFF | ON | 0 | 1 :CALCulate:MARKer:COUPle[:STATe]?
Example	Set **Couple Markers** on: :CALC:MARK:COUP ON
Preset	OFF Presets on **Mode Preset** and "All Markers Off" on page 316
State Saved	Saved in instrument state

3.2.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the **Delta** marker function.

In the Swept SA measurement, for a signal to be identified as a peak it must meet certain criteria. Signals in the negative frequency range, and signals very close to 0 Hz, are ignored. If either the peak excursion or peak threshold functions are on, then the signal must satisfy those criteria before being identified as a peak.

When "Peak Excursion" on page 325 and "Peak Threshold" on page 324 are both off:

– **Peak Search, Continuous Peak Search,** and the maximum part of **Pk-Pk Search**, search the trace for the point with the highest y-axis value that does not violate the LO feedthrough rules. A rising and falling slope are not required for these three peak search functions

– The remaining search functions **Next Peak, Next Pk Right**, etc. only consider trace points that have a rising and falling slope on the left and right respectively

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

BANDED PEAK SEARCH: For all **Peak Search** functions, if you are in the **Trace Zoom** View of the Swept SA measurement, and the bottom window is selected, the search function operates *only* within that window. This allows you to perform a **Peak Search** over a specified, limited frequency range, while still viewing the larger frequency range in the top window.

Marker Frequency | Time

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency | Time" on page 307 on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point that has the maximum y-axis value for that marker's trace, subject to "Peak Search Mode" on page 328 on the **Pk Search Config** tab.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

The **Pk Search Config** menu enables you to define specific search criteria to determine which signals can be considered peaks, excluding unwanted signals from the search.

BANDED PEAK SEARCH: For all **Peak Search** functions, if you are in the **Trace Zoom** View of the Swept SA measurement, and the bottom window is selected, the search function operate *only* within that window. This allows you to perform a **Peak Search** over a specified, limited frequency range, while still viewing the larger frequency range in the top window.

See "More Information" on page 319.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:MAXimum`

Example	Perform a peak search using marker 2:
	`:CALC:MARK2:MAX`
	Query the marker amplitude (Y-axis) value for marker 2:
	`:CALC:MARK2:Y?`
	Query the marker frequency or time (X-axis) value for marker 2:

	:CALC:MARK2:X? :SYST:ERR? can be used to query the errors to determine if a peak is found. The message “No peak found” is returned after an unsuccessful search
Notes	Sending this command selects the subopcoded marker

More Information

The behavior of **Peak Search** depends on settings under the **Peak Search Config** tab. If the setting of **Peak Search Mode** is **Use Excursion and Threshold**, and either **Pk Excursion** or **Pk Threshold** are on, a signal must meet those criteria to be considered a peak. If no valid peak is found, a “No peak found” message is generated, and the marker is not moved.. When **Highest Peak** is on, or both **Pk Excursion** and **Pk Threshold** are off, the marker is always placed at the point on the trace with the maximum y-axis value, even if that point is on the very edge of the trace (exception: negative frequencies and signals close to the LO are not searched at all).

Pressing **Peak Search** with the selected marker **Off** causes the selected marker to be set to **Normal** at the center of the screen, then a peak search is immediately performed.

Pressing the front panel **Peak Search** key *always* does a peak search. Occasionally, you may need to get to the **Peak Search** menu key functions without doing a peak search. You can do this by first accessing the **Marker** menu, then pressing the **Peak Search** tab. The **Peak Search** menu appears without performing a **Peak Search.**

Peak Search All Traces

In the **Spectrogram** View, when **Peak Search All Traces** is pressed, a **Peak Search** is executed that finds the highest point on *all* of the drawn traces in the **Spectrogram** window. The marker moves there, and the **Display Trace** changes to the trace on which the peak was found.

This function obeys the criteria in the **Pk Search Config** menu in the same way that the normal **Peak Search** function does.

Remote Command	:CALCulate:MARKer[1]|2|…|12:MAXimum:ALL
Example	:CALC:MARK2:MAX:ALL :SYST:ERR? can be used to query the errors to determine if a peak is found. The message “No peak found” is returned after an unsuccessful search
Notes	Sending this command selects the subopcoded marker
Dependencies	Only appears in the **Spectrogram** View. If sent outside of **Spectrogram**, generates an error

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value. Only peaks that meet all enabled peak criteria are considered (see "Pk Search Config" on page 324). If there is no valid peak lower than the current marker position, a “No peak found” message is generated, and the marker is not moved.

In the LTE/LTE-Advanced Modulation Analysis measurements, if the format is complex (vector or constellation) then the marker moves to the closest point that has a lower magnitude than the marker's current position.

If the selected marker was **Off**, then it is turned on as a **Normal** marker, and a peak search is performed.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:MAXimum:NEXT`
Example	Select Marker 2 and move it to the peak that is closest in amplitude to the current peak, but the next lower value: `:CALC:MARK2:MAX:NEXT`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Right

Moves the selected marker to the nearest peak right of the current marker that meets all enabled peak criteria (see "Pk Search Config" on page 324). If there is no valid peak to the right of the current marker position, a “No peak found” message is generated, and the marker is not moved.

If the selected marker was **Off**, then it is turned on as a **Normal** marker, and a peak search is performed.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:MAXimum:RIGHt` `:CALCulate:<meas>:MARKer[1]|2|…|12:MAXimum:RIGHt`
Example	Select Marker 2 and move it to the next peak to the right of the current marker position: `:CALC:MARK2:MAX:RIGH`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Left

Moves the selected marker to the nearest peak left of the current marker that meets all enabled peak criteria (see "Pk Search Config" on page 324). If there is no valid peak to the left of the current marker position, a “No peak found” message is generated, and the marker is not moved.

If the selected marker was **Off**, then it is turned on as a **Normal** marker, and a peak search is performed.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:MAXimum:LEFT` `:CALCulate:<meas>:MARKer[1]|2|…|12:MAXimum:LEFT`
Example	Select Marker 2 and move it to the next peak to the left of the current marker position: `:CALC:MARK2:MAX:LEFT`
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum y-axis value on the current trace. Minimum (negative) peak searches do not have to meet the peak search criteria. It just looks for the lowest y-axis value. If the selected marker is **Off**, it is turned on before the minimum search is performed.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:MINimum` `:CALCulate:<meas>:MARKer[1]|2|…|12:MINimum`
Example	Select Marker 1 and move it to the minimum amplitude value: `:CALC:MARK:MIN`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency (or time, if in **Zero Span**) differences between the highest and lowest y-axis value. It places the selected marker on the minimum value on its selected trace. And it places that marker’s reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to **Fixed** or **Normal** if it is not already on. (These markers may be on two different traces.)

The rules for finding the maximum peak are the same as for **Peak Search**, including the use of the peak criteria rules. However, the minimum trace value is not required to meet any criteria other than being the minimum y-axis value in the trace.

If the selected marker is **Off**, a **Delta** type marker is turned on, and the peak-to-peak search is done. If the selected marker is on, but it is not a **Delta** marker, then it is changed to **Delta**, which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:PTPeak` `:CALCulate:<meas>:MARKer[1]|2|…|12:PTPeak`
Example	Query the delta amplitude value for marker 1: `:CALC:MARK:PTP`
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Dependencies	Pk-Pk Search is not available when **Coupled Markers** is on
Couplings	The selected marker becomes a **Delta** marker if not already in **Delta** mode
State Saved	Not part of saved state

Marker Delta

Pressing this button has the same effect as pressing **Delta** in "Marker Mode" on page 312 on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

Mkr->CF

Assigns the selected marker's frequency to "Center Frequency" on page 279.

The control is duplicated here to allow you to conveniently perform a peak search and **Marker to CF** without having to access two separate menus.

Mkr->Ref Lvl

Assigns the selected marker's level to **Reference Level**. See "Marker To" on page 368 for the description of this function. The control is duplicated here to allow you to conveniently perform a peak search and **Mkr->Ref Lvl** without having to access two separate menus.

Continuous Peak Search

Turns **Continuous Peak Search** on or off. When `ON`, a peak search is automatically performed for the selected marker after each sweep. The rules for finding the peak are the same as for **Peak Search**, including the use of the peak criteria rules. If no valid peak is found, a "No peak found" message is generated after each sweep.

See "More Information" on page 323.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:CPSearch[:STATe] ON | OFF | 1 | 0` `:CALCulate:MARKer[1]|2|…|12:CPSearch[:STATe]?`
Example	Turn on **Continuous Peak Search**: `:CALC:MARK:CPS ON`
Notes	Sending this command selects the subopcoded marker
Couplings	Grayed-out when the selected marker is **Fixed**. Also, if **Continuous Peak Search** is `ON`, and the selected marker becomes a **Fixed** marker, then **Continuous Peak Search** is turned `OFF`, and the control is grayed-out **Signal Track** and **Continuous Peak Search** are mutually exclusive so if **Signal Track** is on, **Continuous Peak Search** is grayed-out and *vice versa*
Preset	Mode Preset
State Saved	Saved in instrument state
Status Bits/OPC dependencies	The Measuring bit remains set while this command is operating and does not go false until the marker position has been updated

More Information

When **Continuous Peak Search** is turned on, a peak search is immediately performed and then is repeated after each sweep. If **Continuous Peak Search** is turned on with the selected marker **Off**, the selected marker is set to **Normal** at the center of the screen, and then a peak search is immediately performed and subsequently repeated after each sweep.

When in Continuous Peak Search, `*OPC` will not return true, nor will `:READ` or `:MEASure` return any data, until the sweep is complete, and the marker has been re-peaked. Note further that if the instrument is in a measurement such as averaging, and **Continuous Peak Search** is `ON`, the entire measurement is allowed to complete (that is, all the averages taken up to the average number) before the re-peak takes place, and only *then* will `*OPC` go true and `:READ` or `:MEASure` return data.

Note that this function is not the "Continuous Peak" function found in some other instruments. That function was designed to track the signal; this function simply does a **Peak Search** after each sweep.

When **Continuous Peak Search** is turned on for a marker, a small “hat” is placed above the marker.

3.2.7.4 Pk Search Config

Contains controls that allow you to setup the **Peak Search** functions.

Since the **Pk Search Config** functions are independent of the selected Marker, the **Select Marker** control does not display while in **Pk Search Config**.

Peak Threshold

Turns the peak threshold requirement on/off and sets the threshold value. The peak threshold value defines the minimum signal level (or min threshold) that the peak identification algorithm uses to recognize a peak.

When both "Peak Excursion" on page 325 and "Peak Threshold" on page 324 are ON, a signal must rise above the **Peak Threshold** value by at least the **Peak Excursion** value and then fall back from its local maximum by at least the **Peak Excursion** value to be considered a peak.

For example, if a threshold value of –90 dBm is selected, the peak search algorithm will only consider signals with amplitude greater than the –90 dBm threshold. If a threshold value of –90 dBm is selected, and **Peak Excursion** is ON and set to 6 dB, the peak search algorithm will only consider signals with amplitude greater than the –90 dBm threshold that rise 6 dB above the threshold and then fall back to the threshold.

NOTE **If a signal comes onto the screen falling and falls all the way to the threshold without ever rising, it is considered a peak at the far-left edge of the display. Similarly, if a signal rises from the threshold and leaves the screen without ever falling, it is considered a peak at the far-right edge of the display. See the diagram below.**

Remote Command	`:CALCulate:MARKer:PEAK:THReshold <ampl>` `:CALCulate:MARKer:PEAK:THReshold?`
Example	Turn on the threshold criterion: `:CALC:MARK:PEAK:THR:STAT ON`

	Set the threshold to -60 dBm: `:CALC:MARK:PEAK:THR -60 dBm`
Dependencies	When **Ref Level Offset** changes, **Peak Threshold** must change by the same amount
Couplings	Whenever you adjust the value of **Peak Threshold** manually, "Pk Threshold Line" on page 327 is turned ON, and, if **Peak Excursion** is also on, the Peak Excursion Region is displayed
Preset	Automatically computed
State Saved	Saved in instrument state
Min	The current displayed Ref Level – 200 dB. The current displayed Ref Level is the current Ref Level, offset by the Ref Level Offset
Max	The current displayed Ref Level. This means the current Ref Level, offset by the Ref Level Offset

Auto Function

Remote Command	`:CALCulate:MARKer:PEAK:THReshold:STATe OFF | ON | 0 | 1` `:CALCulate:MARKer:PEAK:THReshold:STATe?`
Preset	ON

Auto Threshold

Toggles whether the **Peak Threshold** is determined automatically or manually.

The default is ON, which means that **Peak Threshold** is automatically calculated. Manually setting the **Peak Threshold** value sets **Auto Threshold** to `OFF`.

Remote Command	`:CALCulate:MARKer:PEAK:THReshold:AUTO[:STATe] 0 | 1 | ON | OFF` `:CALCulate:MARKer:PEAK:THReshold:AUTO[:STATe]?`
Example	`:CALC:MARK:PEAK:THR:AUTO:STAT ON`
Preset	ON
State Saved	Saved in instrument state

Peak Excursion

Turns the **Peak Excursion** requirement on/off, and sets the excursion value. The value defines the minimum amplitude variation (rise and fall) required for a signal to be identified as peak. For example, if a value of 6 dB is selected, peak search functions like the marker **Next Pk Right** function move only to peaks that rise and fall 6 dB or more.

When both "Peak Excursion" on page 325 and "Peak Threshold" on page 324 are ON, a signal must rise above the **Peak Threshold** value by at least the **Peak Excursion** value and then fall back from its local maximum by at least the **Peak Excursion** value to be considered a peak.

NOTE: In the event that a sequence of trace points with precisely the same values represents the maximum, the leftmost point is found. If a signal comes onto the screen falling and falls all the way to the threshold without ever rising, it is considered a peak at the far-left edge of the display. Similarly, if a signal rises from the threshold and leaves the screen without ever falling, it is considered a peak at the far-right edge of the display.

See "More Information" on page 326.

Remote Command	`:CALCulate:MARKer:PEAK:EXCursion <rel_ampl>` `:CALCulate:MARKer:PEAK:EXCursion?`

Example	`:CALC:MARK:PEAK:EXC:STAT ON`
	Set the minimum peak excursion requirement to 30 dB:
	`:CALC:MARK:PEAK:EXC 30 DB`

Dependencies	Available only when Y axis unit is amplitude units, otherwise grayed-out
Couplings	Whenever you adjust the value of **Peak Excursion** manually(with the knob, step keys, or by completing a numeric entry), if **Peak Threshold** is ON, "Pk Threshold Line" on page 327 is turned ON, and the Peak Excursion Region is displayed
Preset	Automatically computed
State Saved	Saved in instrument state
Min	0.0 dB
Max	100.0 dB

Auto Function

Remote Command	`:CALCulate:MARKer:PEAK:EXCursion:STATe OFF | ON | 0 | 1` `:CALCulate:MARKer:PEAK:EXCursion:STATe?`
Preset	ON

More Information

If two signals are very close together and the peak excursion and threshold criteria are met at the outside edges of the combined signals, this function finds the highest of these two signals as a peak (or next peak). However, if a signal appears near the edge of the screen such that the full extent of either the rising or falling edge cannot be determined, and the portion that is on screen does not meet the excursion criteria, then the signal cannot be identified as a peak.

When measuring signals near the noise floor, you can reduce the excursion value even further to make these signals recognizable. To prevent the marker from identifying noise as signals, reduce the noise floor variations to a value less than the peak-excursion value by reducing the video bandwidth or by using trace averaging.

Auto Excursion

Toggles whether "Peak Excursion" on page 325 is determined automatically or manually.

The default is ON, which means that **Peak Excursion** is automatically calculated. Manually setting the **Peak Excursion** value sets **Auto Peak Excursion** to OFF.

Remote Command	`:CALCulate:MARKer:PEAK:EXCursion:AUTO[:STATe] 0 | 1 | ON | OFF` `:CALCulate:MARKer:PEAK:EXCursion:AUTO[:STATe]?`
Example	`:CALC:MARK:PEAK:EXC:AUTO:STAT ON`
Preset	ON
State Saved	Saved in instrument state

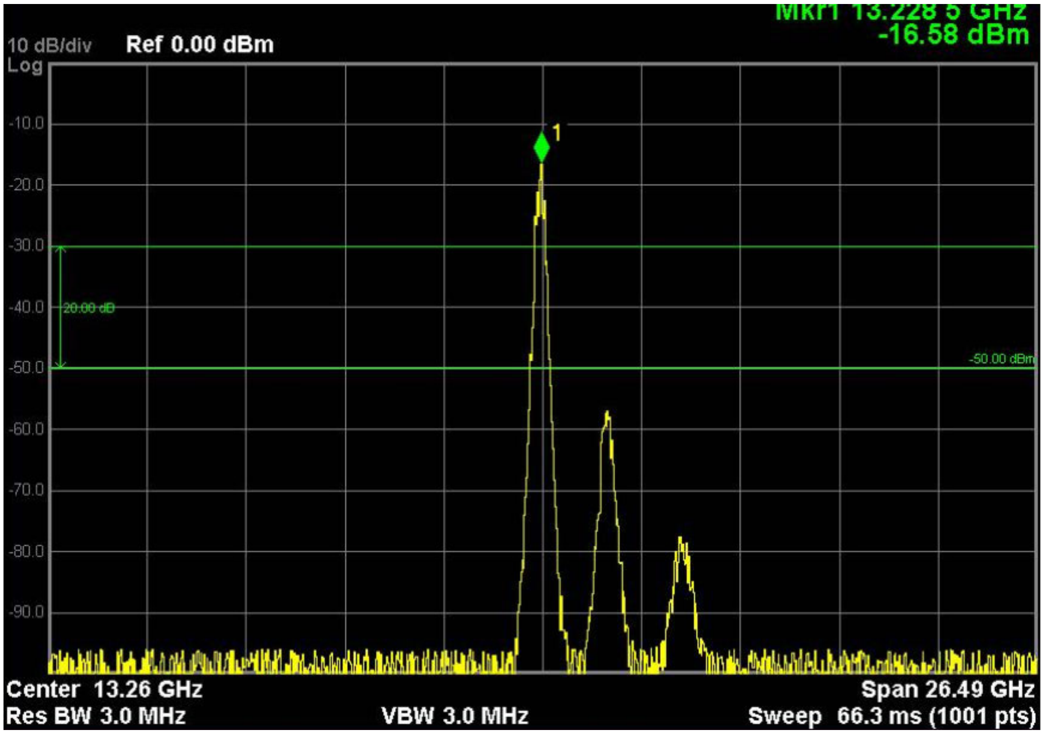
Pk Threshold Line

Turns the peak threshold line on or off. Preset state is OFF.

Remote Command	`:CALCulate:MARKer:PEAK:THReshold:LINE[:STATe] OFF | ON | 0 | 1` `:CALCulate:MARKer:PEAK:THReshold:LINE[:STATe]?`
Example	Turn **Pk Threshold Line** on: `:CALC:MARK:PEAK:THR:LIN:STAT 1`

The Peak Threshold line is green and has the value of the peak threshold (for example, “–20.3 dBm”) written above its right side, above the line itself. If **Peak Excursion** is ON, it shows on the left side as a region above the **Pk Threshold Line**. As with all such lines (Display Line, Trigger Level line, etc.) it is drawn on top of all traces.

The **Peak Threshold** and **Peak Excursion** lines can be adjusted using the step keys, knob, or numeric keypad. They can also be dragged on the display with your finger or a mouse.



This function is automatically set `ON` (thus turning on the Peak Threshold line) whenever the value of **Peak Threshold** or **Peak Excursion** becomes the active function, unless **Peak Threshold** is `OFF`. It is automatically set `OFF` whenever **Peak Threshold** is set to `OFF`. Manually turning it `ON` automatically turns on **Peak Threshold**.

The **Peak Excursion** part is `ON` whenever the **Peak Threshold** part is `ON`, unless **Peak Excursion** is `OFF`.

Peak Search Mode

Lets you specify what kind of search you want to do when **Peak Search** is pressed (or the equivalent command sent).

Note that there are two “types” of peak search functions. One type is the “Peak Search” type, the other type is the “Next Peak” type. “Next Peak” searches (for example, **Next Peak**, **Next Pk Left**, **Next Pk Right**) are qualified by using the Excursion and Threshold criteria. The “Peak Search” type of search simply finds the highest point on the trace.

However, using the **Peak Search Mode** control, you can change the “Peak Search” type of search so that it also uses the Excursion and Threshold criteria. This allows you to find the Maximum point on the trace that also obeys the Excursion and/or

Threshold criteria. This would be useful if, for example, you did not want to perform the Peak Search at all unless there was a signal on the screen above a certain level.

When **Highest Peak** is selected, pressing **Peak Search** simply finds the highest peak on the marker's trace. When **Use Excursion & Threshold** is selected, the search is also qualified by the Excursion and Threshold values (as long as these criteria are On).

Note that this control also affects "Continuous Peak Search" on page 323, and the **Peak Search** half of "Pk-Pk Search" on page 321.

Remote Command	`:CALCulate:MARKer:PEAK:SEARch:MODE MAXimum | PARameter` `:CALCulate:MARKer:PEAK:SEARch:MODE?`

Example	Set Highest Peak mode:
	`:CALC:MARK:PEAK:SEAR:MODE MAX`
	Set Excursion & Threshold mode:
	`:CALC:MARK:PEAK:SEAR:MODE PAR`

Preset	`MAXimum`
State Saved	Saved in instrument state
Range	Highest Peak | Excursion & Thr

Peak Table On/Off

Turns **Peak Table** on or off. When `ON`, the display is split into a measurement window and a peak table display window.

Turning **Peak Table** `ON` turns `OFF`"Marker Table" on page 316, and *vice versa*.

Remote Command	`:CALCulate:MARKer:PEAK:TABLe:STATe OFF | ON | 0 | 1` `:CALCulate:MARKer:PEAK:TABLe:STATe?`
Example	Turn on and display the peak table: `:CALC:MARK:PEAK:TABL:STAT ON`
Dependencies	Only available as a switch in the **Normal** View. **Peak Table** is also available as a selection in the **Window Data** dropdown in all Views When **Peak Table** turns on, if **Peak Threshold** is `ON`, then it becomes the active function
Preset	`OFF`
State Saved	Saved in instrument state

Peak Table Sort

Sets the peak table sorting routine to list the peaks in order of descending amplitude, ascending frequency or descending "Delta to Limit" value. The remote command can also be used to sort the peaks found using `:CALCulate:DATA:PEAKs`.

You can also sort the table and change the order between ascending and descending by tapping a column header once or twice.

Remote Command	`:CALCulate:MARKer:PEAK:SORT FREQuency | AMPLitude | DELTa` `:CALCulate:MARKer:PEAK:SORT?`
Example	Set sorting routine to list peaks in order of descending amplitude: `:CALC:MARK:PEAK:SORT AMPL`
Preset	`AMPLitude`
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`:TRACe:MATH:PEAK:SORT`

Peak Table Readout

Shows up to twenty signal peaks as defined by the setting:

All	`ALL`	Lists all the peaks defined by the peak criteria, in the current sort setting
Above Display Line	`GTDLine`	Lists the peaks that are greater than Display Line 1, and that meet the peak criteria. They are listed in the current sort order
Below Display Line	`LTDLine`	Lists the peaks that are less than Display Line 1, and that meet the peak criteria. They are listed in the current sort order

If **Peak Threshold** and/or **Peak Excursion** are `ON`, then only peaks that meet the defined criteria are found.

See "More Information" on page 331.

Remote Command	`:CALCulate:MARKer:PEAK:TABLe:READout ALL | GTDLine | LTDLine` `:CALCulate:MARKer:PEAK:TABLe:READout?`

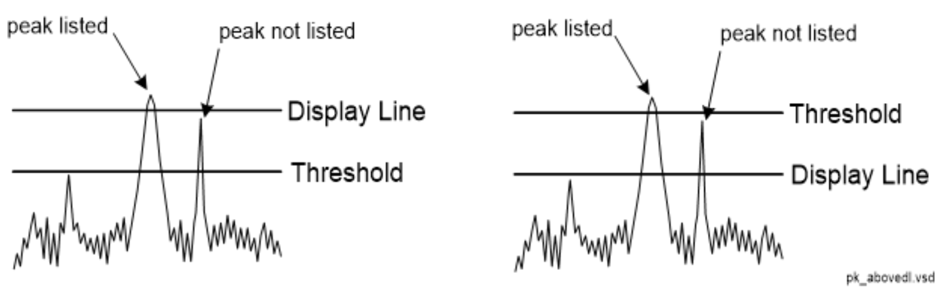
Example	All peaks:
	`:CALC:MARK:PEAK:TABL:READ ALL`
	Peaks above display line 1:
	`:CALC:MARK:PEAK:TABL:READ GTDL`
	Peaks below display line 1:
	`:CALC:MARK:PEAK:TABL:READ LTDL`

Dependencies	Turning Display Line 1 off forces Readout to `ALL`
Couplings	If `GTDL` or `LTDL`, then if Display Line 1 is not already on, it is turned on (it has to be on or it cannot be

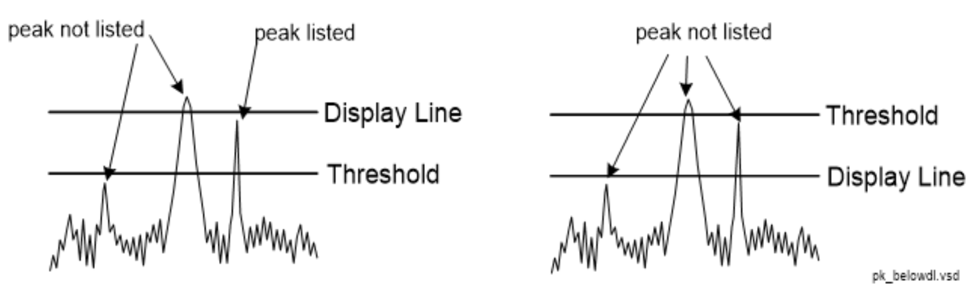
	used to exclude peaks)
Preset	`ALL`
State Saved	Saved in instrument state

More Information

If "Display Line" on page 268 is `ON`, the Peak Table can be selected to include all peaks, or only those above the **Display Line**, or only those below the **Display Line**. See the figures below to understand what happens if both **Display Line** and **Peak Threshold** are `ON`.



Above Display Line Peak Identification



Below Display Line Peak Identification

Maximum Number of Peaks

Sets the maximum number of peaks shown in the Peak Table.

Remote Command	`:CALCulate:MARKer:PEAK:MPEaks <max_peaks>` `:CALCulate:MARKer:PEAK:MPEaks?`
Example	`:CALC:MARK:PEAK:MPE 50`

	:CALC:MARK:PEAK:MPE?
Preset	20
State Saved	Saved in instrument state
Min	1
Max	500

Δ to Limit

Selects the Limit to be used for the Δ to Limit column in the **Peak Table**, and turns the Δ to Limit column on and off.

When ON, this column shows the difference between each peak and the specified Limit.

Remote Command	:CALCulate:MARKer:PEAK:TABLe:DTLimit LLINE1 | … | LLINE6 :CALCulate:MARKer:PEAK:TABLe:DTLimit?
Example	:CALC:MARK:PEAK:TABL:DTL:STAT ON :CALC:MARK:PEAK:TABL:DTL LLINE1
Preset	LLINE1

Auto Function

Remote Command	:CALCulate:MARKer:PEAK:TABLe:DTLimit:STATe ON | OFF :CALCulate:MARKer:PEAK:TABLe:DTLimit:STATe?
Preset	OFF

Query the Signal Peaks (Remote Query Only)

Returns a list of peaks of the specified trace that are above **Peak Threshold** (if ON) and have an excursion above **Peak Excursion** (if ON).

Remote Command	:CALCulate:DATA[n]:PEAKs? <threshold>,<excursion>[,AMPLitude | FREQuency | TIME,[ALL | GTDLine | LTDLine]]
Example	:CALC:DATA1:PEAKs? -90, 6 Response: :1.000000000E+01, -1.804702691E+01, 1.320202000E+10, -1.831304020E+01, 1.325500000E+10, -2.069423795E+01, 1.312255000E+10, -4.752705087E+01, 1.293712000E+10, -5.737315428E+01, 1.497685000E+10, -5.898005784E+01, 1.492387000E+10, -5.968565135E+01, 1.505632000E+10, -6.822387883E+01, 1.518877000E+10, -7.021781263E+01, 1.476493000E+10, -7.404477322E+01, 1.471195000E+10 Note: The first value is the number of peaks that meets the specified limits

The following query is provided for backwards compatibility with ESA and PSA. It is recommended that you use `:CALC:DATA:PEAK` instead.

Returns the signal peaks by frequency or by amplitude. This query uses only Trace 1 data. The sort mode is determined by `:TRACe:MATH:PEAK:SORT`. The commands `:CALCulate:MARKer:PEAK:EXCursion` and `:CALCulate:MARKer:PEAK:THReshold` are used to determine what is a signal peak. To query the number of signals found meeting the specified limits, use `:TRACe:MATH:PEAK:POINts?`

Example	`:TRAC:MATH:PEAK?` Identifies the peaks of trace 1 that are above **Peak Threshold** (if Threshold is ON) and have an excursion above **Peak Excursion** (if Excursion is ON)
Backwards Compatibility SCPI	`:TRACe:MATH:PEAK[:DATA]?`

Query Number of Peaks Found (Remote Query Only)

Provided for backwards compatibility with ESA and PSA. It is recommended that you use `:CALC:DATA:PEAK` instead.

Returns the number of signal peaks identified. The amplitude of the peaks can then be queried with `:TRACe:MATH:PEAK:DATA?` This query uses only Trace 1 data.

Example	`:TRAC:MATH:PEAK:POINts?` Identifies the number of peaks of trace 1 that are above **Peak Threshold** (if Threshold is ON) and have an excursion above **Peak Excursion** (if Excursion is ON)
Backwards Compatibility SCPI	`:TRACe:MATH:PEAK:POINts?`

3.2.7.5 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency | Time

This is the fundamental control that you use to move a marker around on the trace. It is the same as the "Marker Frequency | Time" on page 307 control on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by **Marker, Properties**, "Relative To" on page 333. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:REFerence <integer>` `:CALCulate:MARKer[1]|2|…|12:REFerence?`
Example	Set the marker 1 reference marker to 2, and turn marker 1 on as a **Delta** marker: `:CALC:MARK1:REF 2`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” When queried, a single value is returned (the specified marker number’s relative marker)
Couplings	The act of specifying the selected marker’s reference marker makes the selected marker a **Delta** marker If the reference marker is **Off**, it is turned on in **Fixed or Normal** mode at the delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker + 1). For example, if Marker 2 is selected, then it’s default reference marker is Marker 3. The exception is Marker 12, which has a default reference of Marker 1 Set to the defaults by using **Restore Mode Defaults**. This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by **Marker Off** and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

X Axis Scale

Determines how the X-Axis information for the selected marker is displayed in the marker area (top-right of display) and the active function area of the display, and how the marker is controlled. The available settings for the X Axis Scale are Frequency, Period, Time, and Inverse Time.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:X:READout FREQuency	TIME	ITIMe	PERiod` For option details, see "Options" on page 335 `:CALCulate:MARKer[1]|2|…|12:X:READout?`
Example	Set the Marker 3 X Axis Scale to Time: `:CALC:MARK3:X:READ TIME`
Notes	If in **Delta** marker mode, the value used for X Axis Scale of both the marker and the reference marker (for calculating the delta) is that of the marker, independent of what the reference marker is set to This command causes the specified marker to become selected

Preset	AUTO = ON Marker Preset (selected when a marker is turned **Off**): **Auto** (see below). In most measurements, the **Auto** setting results in Frequency being the preset readout Note that the marker trace should first be preset according to the Marker Trace rules before this preset is applied
State Saved	Saved in instrument state

Auto Function

Remote Command	`:CALCulate:MARKer[1]|2|…|12:X:READout:AUTO ON | OFF | 1 | 0` `:CALCulate:MARKer[1]|2|…|12:X:READout:AUTO?`
Preset	ON

Options

Value	SCPI	Notes
Frequency	FREQuency	Displays the absolute frequency of a normal marker or the frequency of the delta marker relative to the reference marker
Period	PERiod	Displays the reciprocal of the frequency of the marker, or the reciprocal of the frequency separation of the two markers in a delta-marker mode. The units are those of time (sec, msec, etc.) If the markers are at the same frequency in a delta marker mode, the result is the reciprocal of 0, which is infinitely large. The display shows "---" and the SCPI query returns infinity
Time	TIME	Displays the time interval between a normal marker and the start of a sweep or the time of the delta marker relative to the reference marker. Time is the auto setting for time domain traces. In a delta-marker mode it is the (sweep) time interval between the two markers
Inverse Time	ITIMe	Displays the reciprocal time. It is useful in a delta mode to show the reciprocal of (sweep) time between two markers. This function is only meaningful when on a time domain trace and in the **Delta** control mode. If the markers are at the same X Axis value, the time between them is 0, so the reciprocal of sweep time is infinitely large. The display shows "---" and the SCPI query returns *infinity*

The **X Axis Scale** of a marker is the scale of its X Axis value. This affects the units displayed in the Marker Result block and used to specify the marker's X Axis location. The X Axis Scale is specified using **Marker, Properties, X Axis Scale**.

All markers in swept spans have both a time and frequency value. Which of these is used for the result display, and for positioning the marker, depends on the **X Axis Scale** setting. The **X Axis Scale** setting can be **Frequency** or **Time**, as well as the reciprocal of either (**Period** or **Inverse Time**). There is also an **Auto** setting – when in **Auto**, a marker's **X Axis Scale** changes whenever the domain of the trace, upon which it set, changes. All choices for **X Axis Scale** are allowed. Note that this behavior differs from the behavior in previous instruments: previously the instrument remembered a different **X Axis Scale** (formerly called **Readout**) for each domain, and the choices of **X Axis Scale** were restricted. These restrictions were based on the current domain of the instrument.

When in **Auto**, the X-Axis Scale is **Frequency** if the Marker Trace is a frequency domain trace, **Time** if the Marker Trace is a time domain trace. When in **Auto**, if the marker changes traces, or the domain of the trace the marker is on changes, the auto result is re-evaluated. If the X Axis Scale is chosen manually, that scale is used regardless of the domain of the trace.

If **Frequency** or **Period** is selected for a time domain trace, all points in the trace show the same value. Attempting to use the knob or step keys to adjust the X Axis value of the marker or entering an X Axis value from the numeric keypad or remotely has no effect, but generates no error.

Frequency domain traces taken in FFT mode have no valid time data. Therefore, when **Time** or **Inverse Time** is selected for markers on such traces, the X Axis value is taken as the appropriate percentage of the displayed sweep time, which is a calculated estimate.

Lines

When `ON`, displays a vertical line of graticule height and a horizontal line of graticule width, intersecting at the indicator point of the marker (that is, the center of the X or the bottom tip of the diamond. The lines are blue .

Remote Command	`:CALCulate:MARKer[1]|2|…|12:LINes[:STATe] OFF | ON | 0 | 1` `:CALCulate:MARKer[1]|2|…|12:LINes[:STATe]?`
Example	Turn **Lines** on for Marker 2: `:CALC:MARK2:LIN:ON`
Couplings	Sending the remote command causes the addressed marker to become selected
Preset	`OFF`
State Saved	Saved in instrument state

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X Axis Scale of the marker. All markers have an associated trace, even **Fixed** markers; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** or **Delta** markers.

In measurements that support **Auto Initialize**, if **Auto Initialize** is `ON` (the default state) the trace is automatically chosen when the Marker is turned on, based on rules described under "Auto Initialize" on page 337.

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace and turns **Auto Initialize**`OFF` for that marker. If the marker is not **Off**, it moves the marker from the trace it was on to the new trace. If the marker is **Off**, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed, even if that marker is in Auto mode.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:TRACe 1 | … | 12` `:CALCulate:MARKer[1]|2|…|12:TRACe?`
Example	Place Marker 1 on trace 2: `:CALC:MARK1:TRAC 2`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by "Auto Couple" on page 1995 If **Marker Trace** is set manually, **Auto Initialize** goes to `OFF` for that marker Sending the remote command causes the addressed marker to become selected
Preset	1 (Presets on **Meas Preset**, or **All Markers Off**)
State Saved	The **Marker Trace** and state of **Auto Initialize** for each marker is saved in instrument state
Min	1
Max	6

Auto Initialize

When **Auto Initialize** is `ON` for a given marker, the marker's trace is re-determined automatically by the instrument whenever the marker turns on (**Normal**, **Delta** or **Fixed**) from an **Off** state. This is the default state of Markers. (The trace attribute is also determined for all markers that are on, whenever **Auto Initialize** is turned on).

When **Auto Initialize** is turned `OFF` for a given marker, the Marker remains associated with the trace it is currently on regardless of whether the marker and/or the marker's trace is subsequently turned on or back off. If the marker is **Off**, it stays off but is now associated with the specified trace.

Auto Initialize is turned off automatically whenever "Marker Trace" on page 336 is used to directly specify a marker's trace.

For more details, see "Auto Init Rules Flowchart" on page 338 below.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:TRACe:AUTO OFF | ON | 0 | 1` `:CALCulate:MARKer[1]|2|…|12:TRACe:AUTO?`
Notes	Turning Marker Trace **Auto Initialize** off has no effect on the trace on which the marker is currently placed

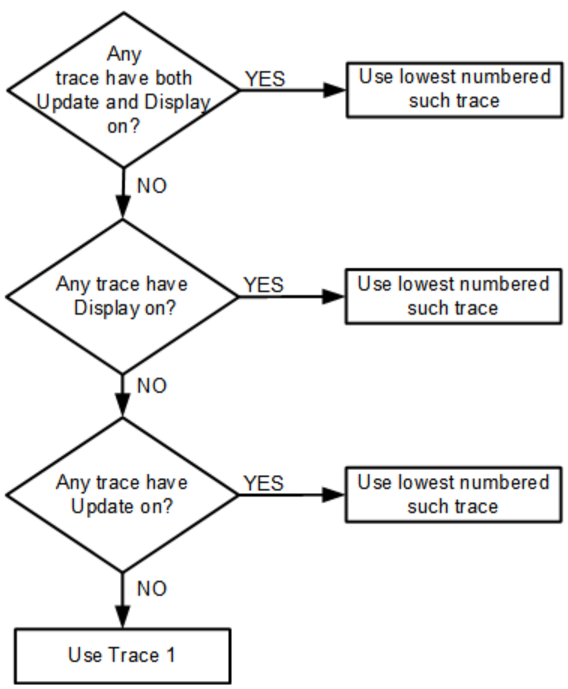
	The response to the query is 0 if OFF, 1 if ON
Couplings	The state of **Auto Initialize** is not affected by "Auto Couple" on page 1995 **Auto Initialize** is set to ON by Preset or **All Markers Off** If **Auto Initialize** is ON for a marker and that marker is on, that marker's **Marker Trace** is immediately set according to the above flowchart Sending the remote command causes the addressed marker to become selected
Preset	ON

When the marker moves between traces the marker's X position in trace points is retained as it moves. For moving between active traces this generally means the x-axis value of the marker does not change. But for moving to or from an inactive trace, the x-axis value takes on that of the new trace at the bucket the marker was on the old trace (and is still on, on the new trace, since the bucket doesn't change).

Note this is true even if the marker is off screen. Thus, a marker that is at the center of the screen on the old trace stays at the center of the screen on the new trace. A marker that is off screen one whole screen to the left on the old trace remains off screen one whole screen to the left on the new trace – even if this means it is at negative time!

Auto Init Rules Flowchart

The following flowchart depicts the **Auto Initialize** rules:



This flowchart makes it clear that putting all lower-numbered traces in View is the simplest way to specify which trace you want the markers to go to when they turn on. For example, if you want all Markers to go to Trace 2 when they turn on, put Trace 1 in View.

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "Marker Settings Diagram" on page 316 on the **Settings** tab.

3.2.7.6 Marker Function

The controls on this tab allow you to control the Marker Functions of the instrument. Marker Functions perform post-processing operations on marker data.

The **Marker Function** menu controls which marker functions are turned on and allows you to adjust the setup parameters for each function. These parameters include the following, but only one parameter can be assigned to a given marker:

- Marker Noise
- Interval Power
- Interval Density
- Off

Marker Frequency | Time

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency | Time" on page 307 on the **Settings** tab.

Band Function

Band Functions are Marker Functions that allow you to define a band of frequencies around the marker. The band defines the region of data used for the numerical calculations. These marker functions also allow you to perform mathematical calculations on trace and marker data and report the results of these calculations in place of the normal marker result.

NOTE

Unlike regular markers, Band Function markers are not placed directly on the trace. They are placed at a location which is relative to the result of the function calculation.

If any of the band adjust SCPI commands (including the `BAND:SPAN` command and the legacy compatibility commands documented under "Band Function Backwards Compatibility" on page 343) are sent while the marker function is off, they are accepted and the value stored. If sent while the marker is **Off**, they are accepted and *ignored*.

See:

– "Fixed marker functions" on page 342
– "Interval Markers" on page 343
– "Offscreen Markers and Band Functions" on page 343
– "Band Function Backwards Compatibility" on page 343

Remote Command	`:CALCulate:MARKer[1]|2|…|12:FUNCtion NOISe | BPOWer | BDENsity | OFF`
	For option details, see "Options" on page 341
	`:CALCulate:MARKer[1]|2|…|12:FUNCtion?`

Example	Turn on Marker 1 as a noise marker:
	`:CALC:MARK:FUNC NOIS`
	Turn on Marker 1 as a band density marker:
	`:CALC:MARK:FUNC BDEN`
	Turn off marker functions for marker 1:
	`:CALC:MARK:FUNC OFF`
	Return the current band function for marker 1. For Marker Noise, returns `NOIS`, for Band Power returns `BPOW`, and for Band Density returns `BDEN`:
	`:CALC:MARK:FUNC?`
	Return the y-axis value of marker 1, which means it returns the Band Function value if a Band Function is on for Marker 1. Note that the delta value when the Y axis unit is Watts is the square of the delta value when the Y axis unit is Volts. For example, when the percent ratio with Y axis unit in Volt is 0.2, the percent ratio with Y axis unit in Watt is 0.22 = 0.04. When you read the value out remotely, you must know whether your Y Axis Unit is log (dB), linear (V or A), or power (W)
	`:CALC:MARK:Y?`

Notes	The zero-width case and the case of a width less than .499 buckets is treated as one bucket wide although it shows a width of 0 When the trace the marker is on crosses domains, the width crosses domains as well, to remain the same percentage of the traceSending this command selects the specifies marker The marker function result is queried in the same way as the Marker Result, as outlined in the Marker section, with `:CALC:MARK:Y?`
Dependencies	Fixed markers: It is not possible to change the Band Function for a **Fixed** marker; so, the Band Function selections are grayed-out for a **Fixed** marker If a marker function was already on when the marker became **Fixed**, then the selected **Band Function** is shown but cannot be changed. Therefore, you cannot directly set the X or Y value of a **Fixed** marker that has a marker function turned on. To turn off the function, turn off the marker

	Average detector and Power Averaging are auto selected when **Marker Noise** on If the selected (specified) marker is **Off**, selecting **Marker Noise** via front panel or SCPI turns the marker on
Couplings	When you choose any Band Function and **Band Span Auto/Man** is in the **Auto** state, the **Band Span** is set to 5% of the screen width Adjusting the Band Span sets **Band Span Auto/Man** to **Man** While in **Marker Noise** and with **Band Span Auto/Man** in the **Auto** state, if the analyzer Span is changed, **Band Span** stays at 5% of the new span If the selected (specified) marker is off, selecting a **Band Function** via front panel or SCPI turns the marker on If the detector mode for the detector on the marker's trace is set to **Auto**, the `AVERage` detector is selected. If the Average type is set to **Auto**, Power Averaging is selected. Other choices for the detector or Average type may cause measurement inaccuracy
Preset	`OFF`
State Saved	The band function for each marker is saved in instrument state
Annunciation	The band function for the selected marker appears in the Marker Result block and in the Marker Table

Options

The Band Functions are **Marker Noise**, **Band Power**, and **Band Density,** only one of which can be on for a given marker.

Value	SCPI	Notes
Marker Noise	`NOISe`	When **Marker Noise** is on, the marker's Y Axis Result is the average noise level, normalized to a 1 Hz noise power bandwidth, in the band specified under the **Band Adjust** key To guarantee accurate data for noise-like signals, a correction for equivalent noise bandwidth is made by the instrument The **Marker Noise** function accuracy is best when the detector is set to Average or Sample, because neither of these detectors will peak-bias the noise. The tradeoff between sweep time and variance of the result is best when Average Type is set to Power Averaging. Therefore, Auto coupling chooses the Average detector and Power Averaging when Marker Noise is on. Though the Marker Noise function works with all settings of detector and Average Type, using the positive or negative peak detector gives less accurate measurement results Noise Markers assume that the signal to be measured is noise-like. Based on this assumption, we can actually make reasonable measurements under very non-ideal conditions: any detector may be used, any averaging type, any VBW. In contrast, the Band Power and Band Density markers make no assumption about the statistics of the signal
Band Power	`BPOWer`	Computes the total power within a span in a nonzero span. The results computation must include the RBW In **Zero Span**, measures the average power across a time interval. This is sometimes referred to as the interval power

Value	SCPI	Notes
Band Density	`BDENsity`	On frequency domain traces, the band density across a band is the total band power divided by the bandwidth over which it is measured In **Zero Span**, measures the average power across a time interval, divided by Bn. Bn is the noise bandwidth of the RBW filter, as noted and used within the Band Power computation. This is sometimes referred to as the interval density It may seem like the band density marker function is exactly like a function of a noise marker with variable width. But they are somewhat different. The Noise marker assumes that the signal to be measured is noise-like and applies a correction based on that assumption. The Band Density markers make no assumption about the statistics of the signal
Off	`OFF`	Turns off all Band Functions Turning off the marker function has no effect on the band span, nor does it turn the marker **Off**

The unit to be used for displaying Band Function results is automatically chosen based on the control mode (Normal, Delta, Fixed) of the marker and the reference marker. For example, dB/Hz is used when the marker is a noise marker, and the reference marker is a band power marker.If the selected marker is **Off**, pressing **Marker Function** sets it to **Normal** and places it at the center of the display on the trace determined by the Marker Trace rules. However, if the selected marker was **Off**, **Marker Function Off** had to be the selected function, and it remains so even after the marker is thus turned on, although you may then change it.

Fixed marker functions

In the case of a **Fixed** marker, it is not possible to turn on or change a band function. This is because a **Fixed** marker holds the value it had when it became fixed; the trace it was on may keep on changing, so the function value, which depends on trace data, could not be calculated on an ongoing basis.

It is possible to have a **Marker Function** on for a **Fixed** marker, in the case where a function was already on when the marker became Fixed. In this case the function value is retained in the marker. It is also possible to have a **Marker Function** on for a **Fixed** marker in the case when the marker was off and was turned on as **Fixed** because **Delta** was pressed to create a reference marker, in which case the marker function, marker function width, Y Axis value and marker function result that the **Delta** marker had when **Delta** was pressed are copied into the **Fixed** marker. If **Delta** is pressed again, causing the fixed reference marker to move to the delta marker's position, the marker function, marker function width, Y Axis value and marker function result that the **Delta** marker had when **Delta** was pressed are again copied into the fixed reference marker.

If a **Marker Function** is on for a **Fixed** marker, the marker's reported value is derived by the function. Therefore, you cannot directly set the X or Y value of a **Fixed** marker which has a marker function turned on. Indirect setting as detailed above or when a

Peak Search is performed is allowed, as the Fixed marker is always placed on a trace and can derive its function value from the trace at the moment when it is placed.

Interval Markers

What is an interval marker?

The interval power marker measures the average power across some time interval in zero span.

Interval Density is defined to be Interval Power divided by Bn. Bn is the noise bandwidth of the RBW filter, as noted and used within the Band Power computation.

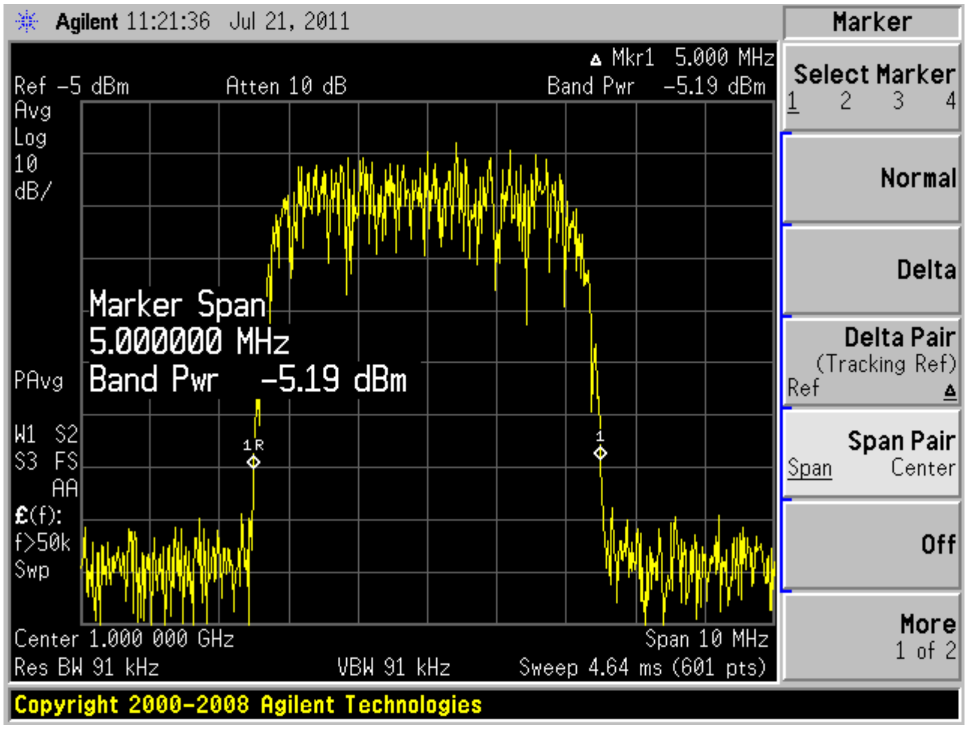
Offscreen Markers and Band Functions

If a Normal or Delta noise marker is so near to the left or right edge of the trace that some of the band is off-screen, then it uses only that subset of the Band Width that is on-trace.

Neither Band power nor Band density markers are defined if any part of the band is off the screen (unless they are Fixed with a stored function value in them), except that when the edges of the bandwidth are trivially off-screen, due to mathematical limitations in the instrument or in the controlling computer, the result is still considered valid.

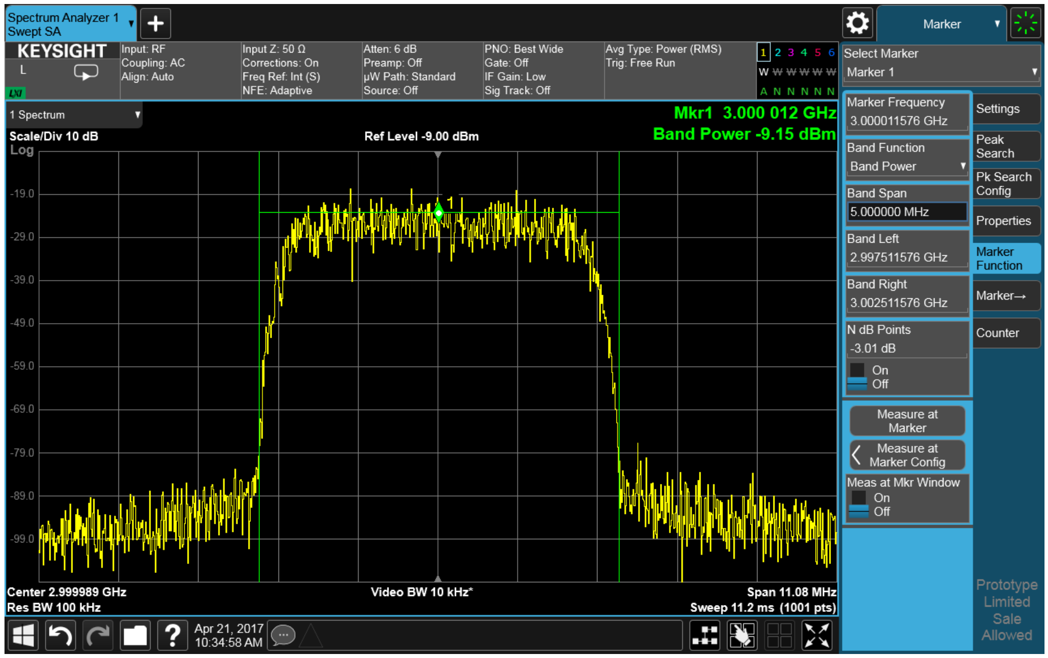
Band Function Backwards Compatibility

To define the Band Power function, the ESA and PSA analyzers used Delta marker functionality with two markers, for example, Marker 1 and its Reference Marker, as shown below:



The marker modes known as Span Pair and Delta Pair (Band Pair in ESA) were used to set two markers for the primary purpose of defining the band of a Band Power function. The two markers were set by adjusting their span and center point (Span Pair mode) or by adjusting their locations independently to directly define the Start and Stop edges of the band (Band Pair/Delta Pair modes).

In X-Series, the introduction of adjustable-width Band Functions fundamentally changes the way Band Power markers are controlled, by using a single marker to completely define the function, as shown below:



In X-Series the marker itself has a width attribute, which you set using the Band Span function. The marker shows “wings” that define the edges of the band in which the Band Power is being measured. You only need one marker, not a pair of markers, to completely define a Band Power function (making it possible to do Delta Band Power, which PSA and ESA could not do).

Additional control functions of Band Left and Band Right are provided for the case when you need to precisely set the band edges. Note that the marker itself always remains centered in the band.

To map the old Span Pair and Band Pair/Delta Pair functions to the X-Series for code compatibility, aliases and compatibility commands were added. Since Span Pair and Band Pair/Delta Pair were primarily used for making band power measurements, the aliases are provided for setting the parameters of a Band Function. If the user was using the old commands for anything other than Band Power these aliases will likely not yield compatible results.

For example, some users took advantage of the fact that the Band Pair commands let you arbitrarily set the frequency (time) of a delta marker and its non-fixed reference marker. In these cases, which had nothing to do with band Power, the new commands will not be compatible. For these use cases the user must use two markers and position each using the `:CALC:MARK:X` commands, since “marker pairs” do not exist anymore.

Note that all the alias commands described below cause the specified marker to become selected.

Marker Mode compatibility

To setup Band Power measurements in the ESA and PSA, you had to send the `:CALCulate:MARKer[1]|2|3|4:MODE POSition|DELTa|BAND|SPAN|OFF` command with either the `BAND` or `SPAN` parameter, in order to turn on the marker control modes that let you use a pair of delta markers as Band Power markers. In the X-Series this is no longer necessary, as there are no special marker modes for Band power. So, when this command is sent with either a `BAND` or `SPAN` parameter it is aliased to simply turn on Normal markers. Thus:

Old command	Aliased to
`:CALCulate:MARKer[1]|2|…|4:MODE:BAND`	`:CALCulate:MARKer[1]|2|…|4:MODE:POSition`
`:CALCulate:MARKer[1]|2|…|4:MODE:SPAN`	`:CALCulate:MARKer[1]|2|…|4:MODE:POSition`

Span Pair Compatibility

In the past, the Span Pair function was used with a marker pair to set the band for Band Power. The following SCPI commands were used when performing this setup programmatically:

```
:CALCulate:MARKer[1]|2|…|4:X:CENTer <param>
:CALCulate:MARKer[1]|2|…|4:X:CENTer?
:CALCulate:MARKer[1]|2|…|4:X:SPAN <param>
:CALCulate:MARKer[1]|2|…|4:X:SPAN?
```

These commands are now aliased as follows to preserve the old functionality as much as possible:

Old command	Aliased to
`:CALCulate:MARKer[1]|2|…|4:X:CENTer`	`:CALCulate:MARKer[1]|2|…|4:X`
`:CALCulate:MARKer[1]|2|…|4:X:SPAN`	`:CALCulate:MARKer[1]|2|…|4:FUNCtion:BAND:SPAN`

Delta Pair/Band Pair functionality

Another way to set the marker pair for Band Power was with the Delta Pair function (Band Pair in ESA). The following SCPI commands were used when performing this setup programmatically:

```
:CALCulate:MARKer[1]|2|…|4:X:STARt <param>
:CALCulate:MARKer[1]|2|…|4:X:STARt?
:CALCulate:MARKer[1]|2|…|4:X:STOP <param>
:CALCulate:MARKer[1]|2|…|4:X:STOP?
```

These commands are now aliased as follows to preserve the old functionality as much as possible:

Old command	Aliased to
`:CALCulate:MARKer[1]|2|…|4:X:STARt`	`:CALCulate:MARKer[1]|2|…|4:FUNCtion:BAND:LEFT`
`:CALCulate:MARKer[1]|2|…|4:X:STOP`	`:CALCulate:MARKer[1]|2|…|4:FUNCtion:BAND:RIGHt`

Arbitrary Marker Pair functionality

Another use case was to use the STARt and STOP commands to arbitrarily set the frequency (time) of a delta marker and its reference marker without being in Band Power mode. This use case is not supported with a backwards compatibility command, but since in the X-Series you can arbitrarily set any marker's value and any reference marker's value, it is easy to fix this problem in code; but the user will have to change their code.

Old command	User must change to
`:CALCulate:MARKer1:X:STARt <param>`	`:CALCulate:MARKer1:X <param>`
`:CALCulate:MARKer1:X:STOP <param>`	`:CALCulate:MARKer2:X <param>`

(in the example marker 1 and marker 2 are used; in practice, use the reference marker number for the STOP marker number, which is usually marker number+1)

Band changes with instrument settings

In the past, when a marker pair was used to set the width of the band for Band Power, the markers held their screen positions when instrument frequency settings such as Span changed. The result of this was that as the Span changed, the frequency difference and hence the width of the band changed as well. In the X-Series, as a result of the change from position markers to value markers, the width of the band remains constant as frequency settings of the instrument change.

Offscreen Markers

As a result of the change from position markers to value markers, markers can be at a frequency which is offscreen, whereas in the past, they were clipped to the screen edges and hence were never offscreen. Users who depended on this clipping behavior by setting Band Span to a high value in order to force Band Power markers to the left and right edges of the screen will have to rewrite their code.

Furthermore, since markers could never be offscreen, Band Power always returned a valid result. In the X-Series, if either edge of the Band is offscreen, Band Power returns not a number as a result.

Direct Marker Positioning

The following commands were used in ESA and PSA to directly set the marker to a specific trace point ("bucket") position when they were being used in Span Pair and Delta Pair/Band Pair modes:

```
:CALCulate:MARKer[1]|2|…|4:X:POSition:CENTer <param>
:CALCulate:MARKer[1]|2|…|4:X:POSition:CENTer?
```

```
:CALCulate:MARKer[1]|2|…|4:X:POSition:SPAN <param>
:CALCulate:MARKer[1]|2|…|4:X:POSition:SPAN?
:CALCulate:MARKer[1]|2|…|4:X:POSition:STARt <param>
:CALCulate:MARKer[1]|2|…|4:X:POSition:STARt?
:CALCulate:MARKer[1]|2|…|4:X:POSition:STOP <param>
:CALCulate:MARKer[1]|2|…|4:X:POSition:STOP?
```

They are aliased very similarly to the non-position commands (above) however a translation to/from trace points (buckets) is also performed:

Old command	Aliased to
:CALCulate:MARKer[1]|2|…|4:X:POSition:CENTer	:CALCulate:MARKer[1]|2|…|4:X:POSition
:CALCulate:MARKer[1]|2|…|4:X:POSition:SPAN	:CALCulate:MARKer[1]|2|…|4:FUNC:BAND:SPAN
:CALCulate:MARKer[1]|2|…|4:X:POSition:STARt	:CALCulate:MARKer[1]|2|…|4:FUNC:BAND:LEFT
:CALCulate:MARKer[1]|2|…|4:X:POSition:STOP	:CALCulate:MARKer[1]|2|…|4:FUNC:BAND:RIGHt

In each case but the first (`:X:POSition:CENTer`),the instrument first converts the specified value in trace points to the current X Axis Scale Units (for example, frequency or time) of the trace upon which the marker resides. Then, that value is used in the alias command to set the desired value.

The query form of the command returns the marker function span in trace points (buckets) by translating back based on the X Axis Scale settings at the time the query is sent.

NOTE The value in Trace Points is translated into the current X Axis Scale units for the purpose of setting the value of the marker. However, the marker's span value, `LEFT` value, or `RIGHt` value in X Axis Scale Units, *not* trace points, is preserved if a change is made to the X Axis scale settings. For example, if you use this command to set a marker function span of 500 buckets, which happens at that time to correspond to 13 GHz, and then you change the instrument's **Start Freq** so that 500 buckets is no longer 13 GHz, the span will stay at 13 GHz, *not* at 500 buckets! This is important to realize as it differs from the legacy behavior.

NOTE The `UP/DOWN` parameters will increment/decrement by one bucket. For this the instrument performs a conversion to buckets and back.

Band Span

Sets the width of the span for the selected marker. The “Band Span” control name is used for all measurements that make frequency domain measurements (even if they have a time-domain mode, such as **Zero Span**). For measurements that have no Frequency Domain measurement mode, such as the Waveform measurement, this function is called “Interval Span”.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:FUNCtion:BAND:SPAN <freq>` `:CALCulate:MARKer[1]|2|…|12:FUNCtion:BAND:SPAN?`

Example	Set the band span of marker 12 to 20 MHz:
	`:CALC:MARK12:FUNC:BAND:SPAN 20 MHz`
	Query the band span of Marker 1:
	`:CALC:MARK:FUNC:BAND:SPAN?`

Notes	Units are those of the trace’s domain, Hz for frequency domain, s for time domain The zero-width case and the case of a width less than .499 buckets are treated as one bucket wide Sending this command selects the subopcoded marker The unit of the parameter must match the current domain of the trace the selected marker is on, or an invalid suffix error is generated. If no unit is sent the fundamental unit for the trace domain is used (Hz for freq domain traces, s for time domain traces) Note that all the values provided in this table are only valid for frequency domain traces. If the current domain of the trace is time domain, values and unit are different. In frequency domain, the Preset value is dependent on the frequency range of the instrument. The default value 1.3245 GHz is appropriate only if the instrument is a 26.5 GHz instrument (Option 526). In a 26.5 GHz Instrument, the default span is 26.49 GHz, so 5% of the span corresponds to 1.3245 GHz
Couplings	When you choose any Band Function and **Band Span Auto/Man** is in the **Auto** state, the **Band Span** is set to 5% of the screen width Adjusting the Band Span sets **Band Span Auto/Man** to Man While in **Marker Noise** and with **Band Span Auto/Man** in the **Auto** state, if the instrument Span is changed **Band Span** will stay at 5% of the new span Changing the Band Span necessarily changes the Band Left and Band Right values Band Span is set to 0 when the marker is turned off
Preset	If 0, set to 5% of span, when a marker function is turned on Swept SA, Log Plot Depends on X axis range of selected Trace Monitor Spectrum
State Saved	Saved in instrument state
Min	0 Hz
Max	Infinity. Unlike legacy instruments, where the markers were forced to be on screen, X-Series marker values are not limited and do not clip
Backwards Compatibility SCPI	`:CALCulate:MARKer[1]|2|…|4:X:SPAN`

Backwards Compatibility Command

Preset	50
Backwards Compatibility SCPI	`:CALCulate:MARKer[1]|2|…|4:X:POSition:SPAN <param>` `:CALCulate:MARKer[1]|2|…|4:X:POSition:SPAN?`

Backwards Compatibility Notes	The old command,
	`:CALCulate:MARKer[n]:X:POSition:SPAN <param>`
	was used to set the span between a delta marker and its reference marker in trace points (buckets) in Span Pair mode. There is no new command for setting the span of a Band Function in trace points. So, when this command is received, the instrument first converts the specified span in trace points to the current X Axis Scale Units (for example, frequency or time) of the trace upon which the marker resides. Then, that value is sent to the
	`:CALC:MARKer[n]:FUNCtion:BAND:SPAN <param>`
	command to set the span of the marker's Band Function
	The query form of the command will return the marker function span in trace points (buckets) by translating back based on the X Axis Scale settings at the time the query is sent
	See "Band Function Backwards Compatibility" on page 343 for more information

Band Left

Sets the left edge frequency or time for the band of the selected marker. The right edge is unaffected.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:FUNCtion:BAND:LEFT <freq>` `:CALCulate:MARKer[1]|2|…|12:FUNCtion:BAND:LEFT?`

Example	`:CALC:MARK12:FUNC:BAND:LEFT 20 GHz`
	sets the left edge of the band span of marker 12 to 20 GHz
	`:CALC:MARK:FUNC:BAND:LEFT?`
	queries the band span of Marker 1

Notes	Units are those of the trace's domain, Hz for frequency domain, s for time domain. When the left edge is moved, the right edge stays anchored; thus, the marker's frequency will change Excess Active Function resolution may require up to 15 digits to allow sub-bucket resolution in narrow spans with many points. Our calculations indicate 15 digits plus decimal point may be required. This will not fit on the control; so the control value can only display to 12 digits, but the value in the active function area should display to the full sub-bucket resolution Sending this command selects the subopcoded marker The unit of the parameter must match the current domain of the trace the selected marker is on, or an invalid suffix error is generated.If no unit is sent, the fundamental unit for the trace domain is used (Hz for freq domain traces, s for time domain traces) Note that all the values provided in this table are only valid for frequency domain traces. If the current domain of the trace is time domain, values and unit are different. In frequency domain, the Preset value is dependent on the frequency range of the instrument. The default value 1.3245 GHz is appropriate

	only if the instrument is a 26.5 GHz instrument (Option 526). In a 26.5 GHz Instrument, the default span is 26.49 GHz, so 5% of the span corresponds to 1.3245 GHz
Couplings	Changing **Band Left** necessarily changes **Band Span** and **Band Center** **Band Span** is set to 0 when the marker is turned off, which means **Band Left** is set to the center value at this time **Band Span** is set to 5% of span when any marker function is turned on if and only if it is zero at that time
Preset	If 0, **Band Span** is set to 5% of span, when a marker function is turned on, which affects **Band Left**
State Saved	Saved in instrument state
Min	0 Hz
Max	Infinity. Unlike legacy instruments, where the markers were forced to be on screen, X-Series marker values are not limited and do not clip

Backwards Compatibility Command

Preset	0
Backwards Compatibility SCPI	`:CALCulate:MARKer[1]|2|…|4:X:POSition:STARt <integer>` `:CALCulate:MARKer[1]|2|…|4:X:POSition:STARt?`

Backwards Compatibility Notes	The legacy command,
	`:CALCulate:MARKer[n]:X:POSition:STARt <param>`
	was used to control the Reference marker in trace points (buckets) in Band Pair/Delta Pair mode. There is no new command for setting the start of a Band Function in trace points. So, when this command is received, the instrument first converts the specified span in trace points to the current X Axis Scale Units (for example, frequency or time) of the trace upon which the marker resides. Then, that value is sent to the
	`:CALC:MARKer[n]:FUNCtion:BAND:LEFT <param>`
	command to set the start of the marker’s Band Function
	The query form of the command will return the marker function LEFT value in trace points (buckets) by translating back based on the current X Axis Scale settings at the time the query is sent
	See "Band Function Backwards Compatibility" on page 343 for more information

Band Right

Sets the right edge frequency or time for the band of the selected marker. The left edge is unaffected

Remote Command	`:CALCulate:MARKer[1]|2|…|12:FUNCtion:BAND:RIGHt <freq>` `:CALCulate:MARKer[1]|2|…|12:FUNCtion:BAND:RIGHt?`

Example	Set the right edge of the band span of marker 12 to 20 GHz:
	`:CALC:MARK12:FUNC:BAND:RIGHt 20 GHz`
	Query the band span of Marker 1:
	`:CALC:MARK:FUNC:BAND:RIGHt?`

Notes	Units are those of the trace's domain, Hz for frequency domain, s for time domain. When the right edge is moved, the left edge stays anchored; thus, the marker's frequency will change Excess Active Function resolution may require up to 15 digits to allow sub-bucket resolution in narrow spans with many points. Our calculations indicate 15 digits plus decimal point may be required. This will not fit on the control; so, the control value can only display to 12 digits, but the value in the active function area should display to the full sub-bucket resolution Sending this command selects the subopcoded marker The unit of the parameter must match the current domain of the trace the selected marker is on, or an invalid suffix error is generated. If no unit is sent, the fundamental unit for the trace domain is used (Hz for freq domain traces, s for time domain traces) Note that all the values provided in this table are only valid for frequency domain traces. If the current domain of the trace is time domain, values and unit are different. In frequency domain, the Preset value is dependent on the frequency range of the instrument. The default value 1.3245 GHz is appropriate only if the instrument is a 26.5 GHz instrument (Option 526). In a 26.5 GHz Instrument, the default span is 26.49 GHz, so 5% of the span corresponds to 1.3245 GHz
Couplings	Changing **Band Right** necessarily changes **Band Span** and **Band Center** **Band Span** is set to 0 when the marker is turned off, which means **Band Right** is set to the center value at this time **Band Span** is set to 5% of span when any marker function is turned on if and only if it is zero at that time
Preset	If 0, **Band Span** is set to 5% of span, when a marker function is turned on, which affects **Band Right**
State Saved	Saved in instrument state
Min	0 Hz
Max	Infinity. Unlike legacy instruments, where the markers were forced to be on screen, X-Series marker values are not limited and do not clip

Backwards Compatibility Command

Preset	1000, the actual value is dependent on the selected number of sweep points
Backwards Compatibility SCPI	`:CALCulate:MARKer[1]|2|…|4:X:POSition:STOP <integer>` `:CALCulate:MARKer[1]|2|…|4:X:POSition:STOP?`

Backwards Compatibility Notes	The legacy command,
	`:CALCulate:MARKer[n]:X:POSition:STOP <param>`
	was used to control the Delta marker in trace points (buckets) in Band Pair/Delta Pair mode. There is no new command for setting the stop of a Band Function in trace points, so, when this command is received, the instrument first converts the specified span in trace points to the current X Axis Scale Units (for example, frequency or time) of the trace upon which the marker resides. Then, that value is sent to the
	`:CALC:MARKer[n]:FUNCtion:BAND:RIGHt <param>`
	command to set the stop of the marker's Band Function
	The query returns the marker function `RIGHt` value in trace points (buckets) by translating back based on the current X-Axis Scale settings at the time the query is sent
	See "Band Function Backwards Compatibility" on page 343 for more information

Band Span Auto/Man

Determines whether the Band Span for Marker Noise will track the instrument's Span.

When you choose any Band Function, and **Band Span Auto/Man** is in the **Auto** state, the **Band Span** is set to 5% of the screen width.

Adjusting the Band Span sets **Band Span Auto/Man** to **Man**.

This function only affects **Marker Noise**. While in **Marker Noise** and with **Band Span Auto/Man** in the **Auto** state, if the instrument **Span** is changed **Band Span** will stay at 5% of the new span.

If **Band Span Auto/Man** is in the **Man** state, the **Band Span** does not change when **Span** is changed. Also, if any Band Function but **Marker Noise** is in effect, the **Band Span** does not change when **Span** is changed.

The **Band Span** is set to 5% regardless of whether or not this would place part of the Band offscreen. The Marker Noise function is well able to function with part of the band offscreen.

Note that, if in **Zero Span**, "Span" should be replaced by "Sweep Time" in the discussion above.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:FUNCtion:BAND:SPAN:AUTO ON | OFF` `:CALCulate:MARKer[1]|2|…|12:FUNCtion:BAND:SPAN:AUTO?`

Example	Set the band span of marker 12 to Auto:
	`:CALC:MARK12:FUNC:BAND:SPAN:AUTO ON`
	Query the auto band span state of Marker 1:
	`:CALC:MARK:FUNC:BAND:SPAN:AUTO?`

Dependencies	Only appears when the Marker Function for the selected marker is Marker Noise
Couplings	When **AutoBand Span** is turned ON, it immediately adjusts the band span to 5% of **Span**. If you select Marker Noise, and **AutoBand Span** is ON, the Band Span will immediately change to 5% of **Span** If **Band Span** is changed, either by the **Band Span** key, the **Band Left** key, or the **Band Righ**t key, or the equivalent commands, this function is set to **Man** This function is set to **Auto** when the Marker is turned **Off**, or by Preset, or by "Auto Couple" on page 1995 Sending this command selects the subopcoded marker
Preset	Auto
State Saved	Saved in instrument state
Backwards Compatibility Notes	In legacy instruments, the Noise Marker had a width that was always equal to 5% of the span. But in the X-Series it is possible for the user to change the span of the Marker Noise band using the Band Adjust function. To preserve the legacy behavior, the Band Span Auto/Man function is provided. When it is in Auto, which it is by default, the Maker Noise band is always held at 5% of Span, even if the Span

changes. When the user adjusts the Marker Noise Band Span, Band Span Auto/Man is set to Manual. So, the legacy behavior is preserved, but now you can set the Marker Noise Span as well, and that setting is preserved when Span is changed

N dB Points

Turns N dB points on or off, and allows you to set the N dB value. N dB uses the selected marker. If the selected marker is not on when N dB is turned on, the selected marker turns on, as a **Normal** marker, at center screen, and is used by N dB.

See:

– "N dB Points Results Queries" on page 354

– "More Information" on page 356

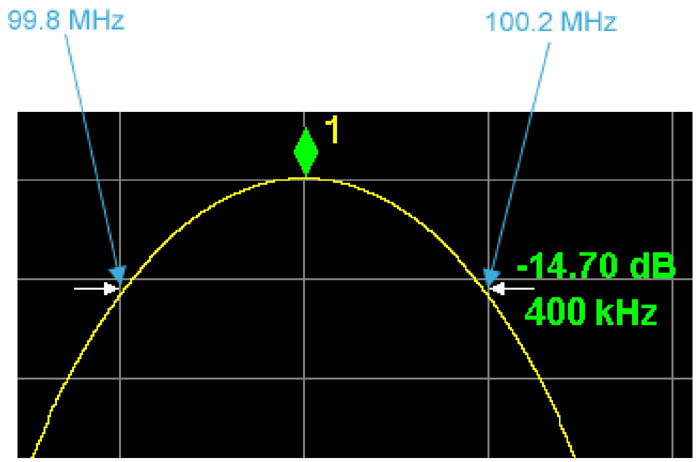
Remote Command	`:CALCulate:BWIDth|BANDwidth:NDB <rel_ampl>` `:CALCulate:BWIDth|BANDwidth:NDB?`
Notes	If the selected marker is turned **Off**, turns off N dB Points N DB Points is unaffected by "Auto Couple" on page 1995
Preset	–3.01dB Off, –3.01 dB
State Saved	The on/off status and the offset value are both saved in instrument state
Min	–140 dB
Max	–0.01 dB

Auto Function

Remote Command	`:CALCulate:BWIDth|BANDwidth[:STATe] OFF | ON | 0 | 1` `:CALCulate:BWIDth|BANDwidth[:STATe]?`
Preset	`OFF`

N dB Points Results Queries

You can query the width of the N dB band as well as the right and left edges of the band. For example, for the signal shown below, the marker is at 100 MHz and each graticule division represents 200 kHz. The N dB value is -14.7 dB, and this makes the width of the N dB band 400 kHz. The frequencies at the left and right edge of the N dB band are as shown, 99.8 MHz and 100.2 MHz:



The following queries return the following values:

`:CALC:BAND:RES? 400 kHz`

`:CALC:BAND:RLEF? 99.8 MHz`

`:CALC:BAND:RRIG? 100.2 MHz`

Remote Command	`:CALCulate:BWIDth|BANDwidth:RESult?`

Example	Set selected marker to 1:
	`:CALC:MARK:AOFF`
	Put marker 1 on peak:
	`:CALC:MARK:MAX`
	Turn on N dB for the selected marker (1):
	`:CALC:BWID ON`
	Set the offset to -3.01 dB:
	`:CALC:BWID:NDB-3.01`
	Query the result:
	`:CALC:BWID:RES?`

Notes	–100 returned if invalid reading

Remote Command	`:CALCulate:BWIDth|BANDwidth:RLEFt?`
Example	Return the leftmost X Axis value for the N dB band: `:CALC:BWID:RLEF?`
Notes	–100 returned if invalid reading

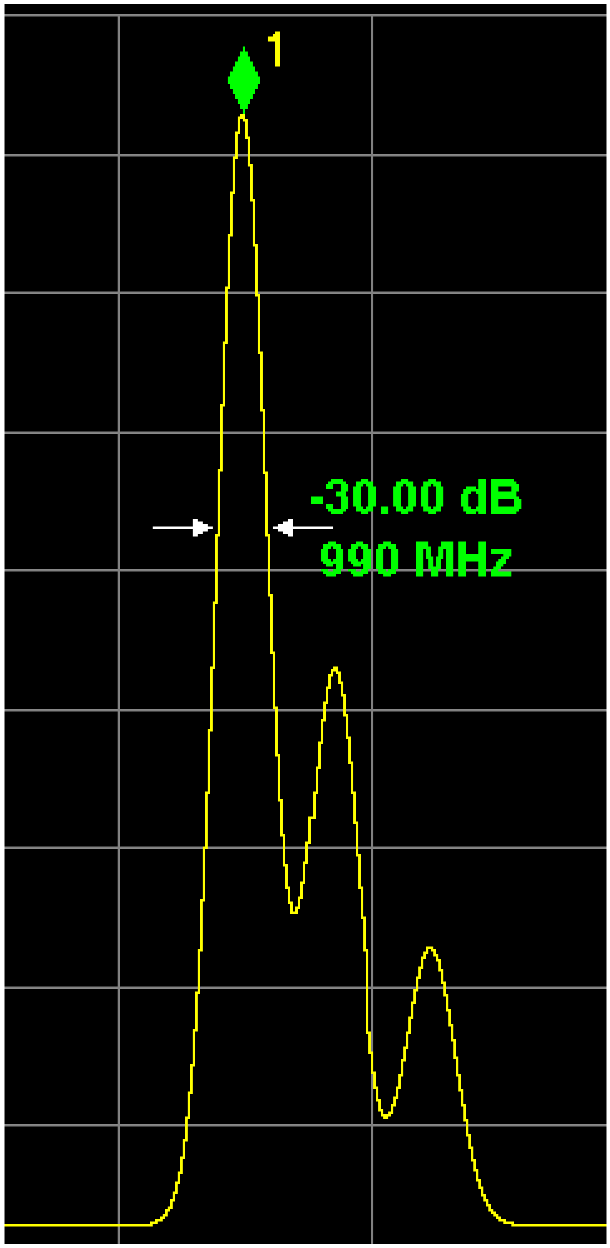
Remote	`:CALCulate:BWIDth|BANDwidth:RRIGht?`

Command	
Example	Return the rightmost X Axis value for the N dB band: `:CALC:BWID:RRIG?`
Notes	–100 returned if invalid reading

More Information

A marker should be placed on the peak of interest before turning on N dB points. The N dB points function looks for the two points on the marker's trace closest to the marker's X Axis value that are N dB below the marker's amplitude, one above and the other below the marker's X Axis value. (That is, one point is to the right, and one is to the left of the selected marker.) The selected N dB value is called the offset. The function reports the frequency difference (for frequency domain traces) or time difference (for time domain traces) between those two points.

Each point is identified by a horizontal arrow pointing towards the marker, next to the trace. The arrows used by the N dB Points function is as shown in the figure below (where each square represents one pixel). They point in, horizontally, at the trace below a peak, on either side of its skirts.



N dB Points can be used to measure the bandwidth of a signal; it is commonly used in conjunction with a tracking generator to measure filter bandwidths.

In one of the common use cases, the marker is placed on a peak, and the arrows are displayed N dB down the skirt from the marker on either side of the peak. The N dB value and the frequency difference between the two arrows is displayed around the arrow as shown in the figure above. Normally this displays on the right arrow, but if this would place any part of the text offscreen to the right then it displays on the left arrow. If the instrument is unable to find data that is N dB below the marker on either side of the marker, the arrows are displayed at the indicator point of the marker, no value (---) is displayed as the result and –100 Hz returned remotely (see figure below):

Some sample N dB scenarios are shown below to illustrate how the function works in various cases. In each case, the two-headed blue arrow represents N dB of amplitude.

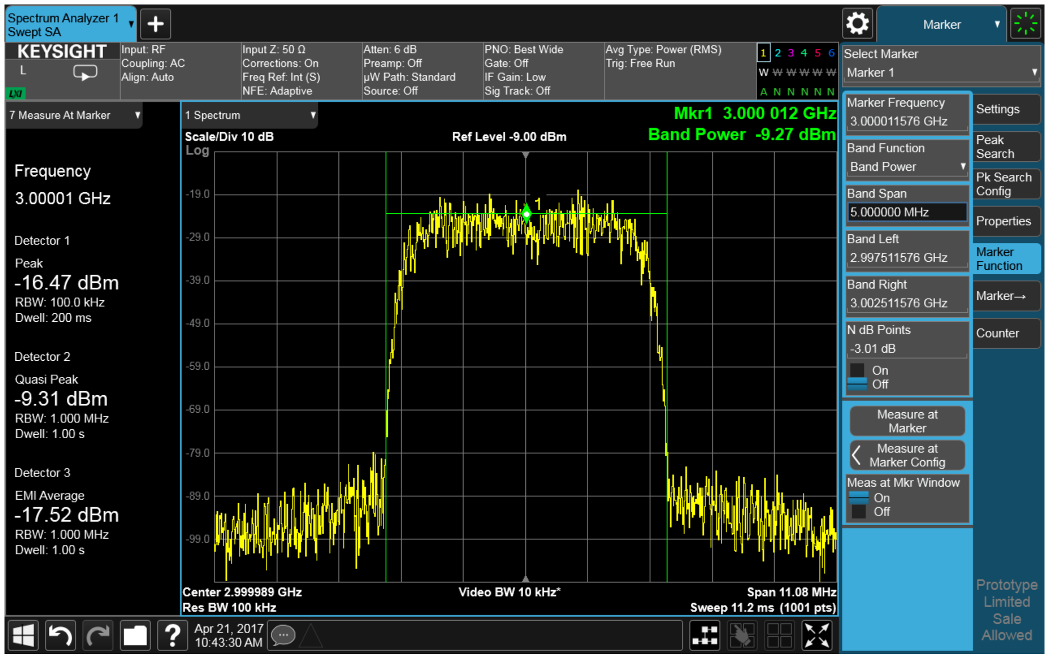
Measure at Marker

When this control is pressed, the instrument executes one **Measure at Marker** function and then returns. **Measure at Marker** goes to the frequency of the selected marker and takes a reading with each of the three detectors selected in the Detectors menu, using the dwell times specified there, then displays the readings in a window on the display, using the current Y-Axis Unit.

When the **Measure at Marker** is complete, the instrument restores all settings to their pre-**Measure-at-Marker** values and normal sweeps resume.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:FUNCtion:MAMarker?`
Example	Perform a **Measure at Marker** function at Marker 2's current frequency and, when completed, return the results of the measure at marker window: `:CALC:MARK2:FUNC:MAM?`
Notes	Returns comma-separated values for the 3 specified detectors and the frequency value of the marker If a Detector is off, or if no measurement has yet completed, –999.0 is returned. This can happen, for example, if you are operating with too large a value of (span/sweep points) and the **Measure at Marker** function does not execute but instead displays the advisory message, "Span per point too large, narrow span or increase RBW or number of points" (see below) The size of the return data array is fixed at 4. The elements are: 1. Detector 1 value (if off, –999.0 for backwards compatibility) 2. Detector 2 value (if off, –999.0 for backwards compatibility) 3. Detector 3 value (if off, –999.0 for backwards compatibility) 4. Frequency of Marker If a sweep is in process when this function executes it aborts, and restarts after the function is complete
Dependencies	Only appears in the N/W6141A application or when Option EMC is installed and licensed If **BW & Avg Type** is in an Autocoupled state, the (up to three) measurements taken by **Measure at Marker** are taken with Auto Coupled settings for the functions in the **BW** menu, even if those functions are in manual
Couplings	If the specified Marker is not on, the instrument turns it on at the center of the screen and does a peak search before performing the function
Annunciation	In the status line messages indicate the progress of the function
Annotation	In the Measure at Marker Window
Status Bits/OPC dependencies	OPC goes true when the measurement is complete
Backwards Compatibility SCPI	`:MEASure:EMI:MARKer[1]|2|…|12?`
Backwards Compatibility Notes	Included for compatibility with the E7400 and PSA option 239. Performs a **Measure at Marker** function at the specified marker's current frequency and returns the results

Measure at Marker displays its information in a separate window that normally appears to the left of the measurement window.



The **Measure at Marker** box shows the detector name for the selected detectors and **Off** for those not selected. The marker frequency is shown in the **Frequency** field. The measured value is shown for all detectors except those that are "Off." For these, --- is displayed. The current Y-Axis unit is used, and the precision that is used for the detector value displays is exactly the same as for the Marker. The precision used for the Frequency display is six significant digits.

The sequence of steps in the measurement is as follows:

- Any sweep in progress is aborted
- If in **Zero Span**, the Center Frequency is used as the frequency at which to take the reading, since, in **Zero Span**, all markers are by definition at the Center Frequency
- If not in **Zero Span**:
- If the selected marker is **Off**, it is first turned on in the center of the screen and a peak search performed
- If the selected marker is on, but offscreen, it is first moved to the center of the screen and a peak search performed
- A frequency "zoom" function is performed to determine the frequency of the selected marker to the required precision. If you are operating with too large a

value of (span/sweep points) then the Measure at Marker window will not display, but instead an advisory message, “Span per point too large, narrow span or increase RBW or number of points”.This means you have chosen a combination of RBW, span and sweep points that makes each trace point much wider than the RBW, so that the trace point in which the signal appears is an inadequately precise measure of its frequency—for example, with a 30 MHz to 1000 MHz span, 601 trace points and 120 kHz RBW, each trace point is 13 times as wide as the RBW. In this case, a SCPI query of the results will yield –999 dBm for each detector

- If the zoom is successful, the instrument goes to zero span at this frequency.
- Each detector is then read in successive single-point zero span sweeps, using a sweep time equal to the specified dwell time. The value displayed by Measure at Marker represents the maximum value output by the detector during the dwell timeAutocoupled bandwidth and average type settings are used for each detector unless the **BW & Avg Type** control is set to **As Set**, in which case the current bandwidth and average type settings are used.
- Each result is then displayed in the measure at marker window as it becomes available
- The instrument returns to its pre-Measure at Marker span and settings after executing a Measure at Marker function, including Bandwidth, Avg Type, and EMC Std - regardless of the setting of **BW & Avg Type**
- Finally, if the sweep had to be aborted, the aborted sweep is restarted

Zooming

We want to make the "measure at marker" measurements with zero span data acquisition that is sometimes "zoomed." In this case, the definition of "zoomed" is "at a frequency within +/–0.5 bucket of the marker frequency, selected to optimize accuracy, based on the trace on which the marker is placed."

This definition of zoom is different from that used in counter zooming and preselector centering zooming and tune-and-listen zooming, all of which assume a reasonably stationary signal. With a stationary signal, zooming via repeatedly narrowing data acquisitions to find the signal with subbucket resolution is feasible; with EMC measurements, many signals (for example pulsed RF) are not stationary or not constant. Furthermore, the reason for zooming in EMC is because the user’s setup often represents a combination of RBW, span and sweep points that makes the bucket location of a signal an inadequately precise measure of its frequency (for example, if the user is looking at one or more full CISPR bands). A commonly used workaround for not zooming is to use more display points. However, with measure at marker, the peak detector is not going to do a good job in zero span unless the tuning is within about 5% of an RBW.

Instead, we can choose the frequency for the marker to higher resolution than the bucket resolution by interpolating from the trace data. This technique does not require another “zoom sweep” and thus will not misbehave with nonstationary signals like pulsed RF. Therefore, there should be no need to defeat the zoom function under user control.

In EMC measure-at-marker operations, we assume a CW signal, because fine-tuning the frequency of a CW signal can have a significant effect on accuracy. For other signal statistics, such as noise and pulsed-RF, fine-tuning is neither possible nor required. So, we can assume CW.

This algorithm will address two issues:

1. When to position the zero-span acquisition at a new frequency

2. What that new frequency is

To determine 1) we need to first perform the calculation in 2).

First we specify that the zoom will always be performed with the peak detector. The math is different (simpler but much different) with the sample detector and unreasonably complicated with other detectors, so it is not reasonable to assume anything other than a peak detector. The algorithm can still operate for other detectors, but it is not as accurate for those.

From the marker amplitude and the amplitudes at the adjacent buckets, we can compute the peak frequency for a CW signal. In fact, with the peak detector, we can compute that frequency from the marker bucket and the next lower bucket, and we can semiredundantly compute it symmetrically from the marker bucket and the next higher bucket. If these two agree, it means the signal is CW; if they disagree, it is not. If it is CW, we will change the frequency at which we acquire data for the measure at marker from the frequency of the marker; if the signal is not CW, we will not change the frequency (not zoom).

Step 1. Compute the frequency from the lower pair of buckets. Compute

fLowerCandidate = fCenterOfBucket – 0.5*BucketWidth + RBW3dB*sqrt(deltaA/(3dB))

fLowerCandidate = the estimated CW frequency computed from the lower bucket and marker bucket

fCenterOfBucket = the frequency at the center of the bucket. This is computed from fStart + BucketNumber * Span / (NumBuckets – 1). Of course, this expression in not computable if NumBuckets = 1, which is a nonsensical case, but the instrument should not crash when set up this way. When NumBuckets = 1, use 2 for NumBuckets.

BucketWidth = Span / (NumBuckets – 1)...as above, to protect against the one-bucket case, use 2 for NumBuckets when NumBuckets = 1.

RBW3dB = the 3 dB RBW, which is not normally the annotated RBW for EMC measurements, which are based on the 6 dB RBW.

deltaA = the amplitude at the marker, in dBm, minus the amplitude of the bucket one to the left of the marker, in dBm. Which reminds me...we need to protect against having the marker be the first or last bucket--we can't zoom in these cases.

If the marker is at a peak, as intended, deltaA must be positive. But the algorithm may be run when deltaA is not positive. In this case, we must "intercept" the computation to prevent a mathematics failure wherein the argument of the square root is negative. In this case, we should set fLowerCandidate to CenterOfBucket – 0.5*BucketWidth. This is equivalent to replacing deltaA with max(0,deltaA).

(3dB) is a constant, which reminds us that the units of deltaA are dB.

Step 2. Compute the frequency from the upper pair. Compute

fUpperCandidate = fCenterOfBucket + 0.5*BucketWidth - RBW3dB*sqrt(deltaA/(3dB))

All the terms are the same except:

deltaA = the amplitude at the marker, in dBm, minus the amplitude of the bucket one to the right of the marker, in dBm.

As in step 1:

If the marker is at a peak, as intended, deltaA must be positive. But the algorithm may be run when deltaA is not positive. In this case, we must "intercept" the computation to prevent a mathematics failure wherein the argument of the square root is negative. In this case, we should set fUpperCandidate to fCenterOfBucket + 0.5*BucketWidth. This is equivalent to replacing deltaA with max(0,deltaA)

Step 3. Compare fUpperCandidate with fLowerCandidate. If the absolute value of the difference is less than 0.1*RBW3dB, and deltaA (either one) is positive, then we conclude that the signal is CW and worth fine-tuning. Set the tuning to the mean value, which is (fUpperCandidate + fLowerCandidate)/2. Otherwise, use fMarker for the zero-span acquisition.

Measure at Marker Config

Opens a dialog that allows you to configure the **Measure at Marker** function.

The two most important settings are the detectors and the dwelltime associated with each. Any of the instrument’s detectors (up to three) can be used as the Measure at Marker detectors, or any of the three can be turned off. The dwell time for each detector is also settable.

When performing a Meas at Marker, the dwell time settings that you select will depend on the characteristics of the emission you are measuring. The default dwell time (200 ms) should work well for typical EUT emissions, but sometimes you will encounter emissions for which the defaults are not optimal. This is especially the case for emissions that vary slowly over time or have a slow repetition rate. By lengthening the dwell times, you can increase the likelihood of accurately measuring these low repetition rate signals.

When Measure at Marker is activated, the receiver makes a **Zero Span** measurement for each of the (up to) three detectors selected, using the Dwell Time set for each detector. If the signal's repetition period is greater than 200 ms (the default setting), the dwell time should be increased to capture at least two and preferably more repetitions of the signal. Additionally, if you do not need or do not wish to use a detector to make a measurement, that specific detector may be turned off.

If the **Measure at Marker** window is being displayed, and one of the detectors is changed, any value being displayed for that detector changes to “---“ until the next successful reading from that detector.

Dependencies	This control and the dialog it calls only appear in N6141, or when Option EMC is installed and licensed

Measure at Marker Window On/Off

Turns the **Measure at Marker Window** on or off. Turns `ON` automatically when **Measure at Marker** is initiated and turns `OFF` on Preset. If the Window is turned on without a Measure at Marker result, “---“ is displayed for each result for which the detector is not `OFF`.

Remote Command	`:DISPlay:WINDow:MAMarker[:STATe] ON | OFF | 1 | 0` `:DISPlay:WINDow:MAMarker[:STATe]?`
Example	`:DISP:WIND:MAM ON`
Couplings	The window turns `ON` automatically when **Measure at Marker** is initiated and turns `OFF` on Preset
Preset	`OFF`
State Saved	Saved in instrument state

BW & Avg Type

Controls the type of bandwidth and average type coupling used in **Measure at Marker**.

If set to **Autocoupled**, then the **Res BW** and **Average Type** are selected by the instrument during the **Measure at Marker** function, according to the normal Autocouple rules, regardless of whether **Res BW** and **Average Type** are currently in **Auto**. If set to **As Set**, then the current values for **Res BW** and **Average Type** are used (which could also be **Auto**).

Option	SCPI	Behavior
Autocoupled	`ON`	1. The **EMC Std** changes to CISPR if any of the CISPR detectors

Option	SCPI	Behavior
		(EMI Avg, RMS Avg, QPD) becomes selected; for all other detectors, the value of **EMC Std** that existed before Measure at Marker is used 2. **RBW** autocouples throughout Measure at Marker, even if **RBW** is set to **Manual.** The autocouple rules are based on whatever the instantaneous setting of EMC Std, Span, and Center Freq are
As Set	`OFF`	1. The **EMC Std** never changes; so if it is set to **None** it stays at **None** throughout, even if one of the CISPR detectors is selected 2. If **RBW** is set to **Auto**, then **RBW** autocouples throughout Measure at Marker. The autocouple rules are based on whatever the setting of EMC Std, Span, and Center Freq are 3. If **RBW** is set to **Manual**, the RBW never changes at all throughout Measure at Marker, it stays at the value to which it was set before Measure at Marker began

The instrument returns to its pre-**Measure at Marker** span and settings after executing a **Measure at Marker** function, including Bandwidth, Avg Type, and EMC Std.

It is important to note that, when **Res BW** is coupled to **Frequency**, as it is when **EMC Std** is anything but `NONE`, for all EMI measurements, the frequency it is coupled to for **Measure at Marker** is the *Marker* frequency, *not* the Center Frequency.

Remote Command	`:CALCulate:MAMarker:COUPling ON | OFF | 1 | 0` `:CALCulate:MAMarker:COUPling?`
Example	`:CALC:MAM:COUP ON`
Preset	Autocoupled (`ON`)
State Saved	Saved in instrument state

Center Presel On/Off

Controls the automatic centering of the preselector for the **Measure at Marker** function.

When **Center Presel** is `ON`, the first step in performing the **Measure at Marker** function is to perform a **Presel Center**. This is not performed if the microwave preselector is off, or the selected marker’s frequency is below Band 1. If the function is not performed, no message is generated.

Remote Command	`:CALCulate:MAMarker:PCENter ON | OFF | 1 | 0` `:CALCulate:MAMarker:PCENter?`

Example	:CALC:MAM:PCEN ON
Dependencies	Not shown in models that do not include a preselector, such as Option 503. If the SCPI is sent in these instruments, it is accepted without error, and the query always returns 0
Preset	ON
Backwards Compatibility SCPI	[:SENSe]:EMI:MEASure:PCENter[:STATe] OFF | ON | 0 | 1 [:SENSe]:EMI:MEASure:PCENter[:STATe]?
Backwards Compatibility Notes	Included for compatibility with E7400 and PSA Option 239

Detector 1, 2, 3

Lets you select the detector to be used for Detector 1, 2, or 3, or turn that Detector off. Press the cell containing the value of Detector 1|2|3 to see a dropdown that shows the list of detectors, including **Off**.

Remote Command	:CALCulate:MAMarker:DETector[1]|2|3 OFF | NORMal | AVERage | POSitive | SAMPle | NEGative | QPEak | EAVerage | RAVerage :CALCulate:MAMarker:DETector[1]|2|3?
Example	Set the detector for **Measure at Marker** Detector 1 to OFF: :CALC:MAM:DET OFF Set the detector for **Measure at Marker** Detector 2 to Quasi peak: :CALC:MAM:DET2 QPE
Preset	Detector 1, Peak Detector 2, Quasi Peak Detector 3, EMI Average
State Saved	Saved in instrument state

Detector 1, 2, 3 Dwell Time

Lets you select the dwell time (essentially, the measurement time) to be used while taking the measurement for Detector 1, 2 or 3. Press the cell containing the dwell time value of Detector 1|2|3 to enter the desired value for that Detector.

The minimum allowed dwell time is based on the current detector. If "**Off**" is selected for detector 1|2|3, this control is grayed-out and shows 200 ms.

Remote Command	:CALCulate:MAMarker:DETector[1]|2|3:DWELl <dwell time> :CALCulate:MAMarker:DETector[1]|2|3:DWELl?
Example	Set the detector for **Measure at Marker** Detector 1 to dwell for 500 ms: :CALC:MAM:DET:DWEL 500 ms

	Set the dwell time for Detector 3 to 400 ms: `:CALC:MAM:DET3:DWEL 400 ms`
Preset	200 ms
State Saved	Saved in instrument state
Min	1 ms
Max	60 s
Backwards Compatibility SCPI	`[:SENSe]:EMI:MEASure:DETector:DWELl <dwell time>`
Backwards Compatibility Notes	Included for compatibility with E7400 and PSA option 239. Sets all the detectors' dwell times to the specified amount

3.2.7.7 Marker To

The controls on this tab let you copy the current marker value into other instrument parameters (for example, **Center Frequency**). The currently selected marker is made the active function on entry to this menu (if the currently selected marker is not on when you press this front panel key, it is turned on at the center of the screen as a **Normal** marker, then made the active function).

The **Marker ->** (or **Marker To**) feature is used to quickly assign a marker's x- or y-axis value to another parameter. For example, if a marker's x-axis value is 500 MHz and y-axis value is –20 dBm, pressing **Mkr -> CF** assigns 500 MHz to **Center Frequency**, and pressing **Mkr - >Ref Lvl** assigns –20 dBm to **Ref Level**.

All **Marker To** functions executed from the front panel use the *selected* marker's values, while all **Marker To** remote commands specify in the command which marker's value to use.

Marker Frequency | Time

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency | Time" on page 307 on the **Settings** tab.

Mkr->CF

Sets the instrument **Center Frequency** to the frequency of the selected marker. The marker stays at this frequency, so it moves to the center of the display. In delta marker mode, this function sets the center frequency to the x-axis value of the delta marker. When the frequency scale is in `LOG` mode, the center frequency is not at the center of the display.

If the currently selected marker is not on when this control is pressed, it is turned on at the center of the screen as a **Normal** marker.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:CENTer`
Example	Set the **Center Frequency** of the instrument to the value of Marker 2: `:CALC:MARK2:CENT`
Notes	Sending this command selects the subopcoded marker If specified marker is **Off**, this command will turn it on at the center of the screen as a **Normal** marker
Dependencies	Not available (control is grayed-out) when x-axis is the time domain
Couplings	All the usual couplings associated with setting **Center Frequency** apply

Mkr->CF Step

Sets the instrument Center Frequency (CF) Step size to the marker frequency, or in a **Delta** marker mode, to the frequency difference between the delta and reference markers.

If the currently selected marker is not on when this control is pressed, it is turned on at the center of the screen as a **Normal** marker.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:STEP`
Example	Set **CF Step** to the value (or delta value) of marker 1: `:CALC:MARK1:STEP`
Notes	Sending this command selects the subopcoded marker If specified marker is **Off**, this command turns it on at the center of the screen as a **Normal** marker
Dependencies	Not available (control is grayed-out) when x-axis is the time domain
Couplings	All the usual couplings associated with setting **CF Step** apply

Mkr->Start

Changes **Start Freq** to the frequency of the selected marker. The marker stays at this frequency, so it moves to the left edge of the display. In **Delta** marker mode, this function sets the start frequency to the x-axis value of the **Delta** marker.

If the currently selected marker is not on when this control is pressed, it is turned on at the center of the screen as a **Normal** marker.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:STARt`
Example	Set the start frequency to the value (or delta value) of Marker 1: `:CALC:MARK1:STAR`
Notes	Sending this command selects the subopcoded marker If specified marker is **Off**, this command turns it on at the center of the screen as a **Normal** marker

Dependencies	Not available (control is grayed-out) when x-axis is the time domain
Couplings	All the usual couplings associated with setting **Start Freq** apply

Mkr->Stop

Changes **Stop Freq** to the frequency of the selected marker. The marker stays at this frequency, so it moves to the right edge of the display. In **Delta** marker mode, this function sets the stop frequency to the x-axis value of the **Delta** marker.

If the currently selected marker is not on when this control is pressed, it is turned on at the center of the screen as a **Normal** marker.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:STOP`
Example	Set the stop frequency to the value (or delta value) of Marker 3: `:CALC:MARK3:STOP`
Notes	Sending this command selects the subopcoded marker If specified marker is **Off**, this command turns it on at the center of the screen as a **Normal** marker
Dependencies	Not available (control is grayed-out) when x-axis is the time domain
Couplings	All the usual couplings associated with setting **Stop Freq** apply

Mkr->Ref Lvl

Sets **Reference Level** to the amplitude value of the selected marker, moving the marked point to the reference level (top line of the graticule). The marker's mode (**Normal**, **Delta**, **Fixed**) does not matter in this case. For example, given a **Delta** marker, if the **Delta** marker is the selected marker, its amplitude is applied to the reference level. If the reference marker is selected, its amplitude is applied to the reference level.

If the currently selected marker is not on when this control is pressed, it is turned on at the center of the screen as a **Normal** marker, and its amplitude applied to the reference level.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:RLEVel`
Example	Set **Reference Level** of the instrument to the amplitude of Marker 2: `:CALC:MARK2:RLEV`
Notes	Sending this command selects the subopcoded marker If specified marker is **Off**, this command turns it on at the center of the screen as a **Normal** marker
Couplings	All the usual couplings associated with setting **Reference Level** apply
Backwards Compatibility	**Mkr-> Ref Lvl** behavior for a delta marker is slightly different from earlier models. ESA would calculate the delta amplitude (difference between reference marker and delta marker in dB) and assign that value

Notes	to the reference level (in dBm). PSA would just assign the delta marker's amplitude to the reference level, ignoring the reference marker altogether. X-Series products allow you to select either the reference or the delta marker individually. It is the selected marker's amplitude that is applied to **Reference Level**

MkrD->CF

Sets **Center Frequency** to the frequency difference between the selected marker and its reference marker. The marker is then changed to a **Normal** marker and placed at the center of span.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:DELTa:CENTer`
Example	Set instrument **Center Frequency** to the value of Marker 2: `:CALC:MARK2:CENT`
Notes	Sending this command selects the subopcoded marker
Dependencies	Only available when the selected marker is a **Delta** marker. Otherwise, the control is grayed-out Not available when x-axis is the time domain

MkrD->Span

Sets **Start Freq** and **Stop Freq** to the values of the **Delta** markers. That is, it moves the lower of the two marker frequencies to the start frequency and the higher of the two marker frequencies to the stop frequency. The marker mode is unchanged, and the two markers (delta and reference) end up on opposite edges of the display.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:DELTa:SPAN`
Example	Set **Start Freq** and **Stop Freq** to the values of Marker 2 and its reference marker: `:CALC:MARK2:DELT:SPAN`
Notes	Sending this command selects the subopcoded marker
Dependencies	Only available when the selected marker is a **Delta** marker. Otherwise, the control is grayed-out Not available when x-axis is the time domain
Couplings	All the usual couplings associated with setting **Span** apply (see also **Frequency**)
Backwards Compatibility SCPI	`:CALCulate:MARKer[1]|2|…|12[:SET]:SPAN`
Backwards Compatibility Notes	In earlier ESA and PSA products, **MkrD->Span** would adjust the span and change the **Delta** marker to a **Normal** marker, placing it at the center of screen. In all X-Series products, this is no longer true. The markers remain in **Delta** mode and the delta and reference marker end up on opposite edges of the display

Mkr -> Zoom Center

Only appears in the **Trace Zoom** View.

Moves the zoom region so that it is centered at the selected marker in the top window. **Zoom Span** is not changed, except as necessary to keep the entire Zoom Region between the top window start and stop frequencies. The center frequency of the lower window changes to reflect the new zoom center frequency.

If the marker frequency is entirely outside the current instrument (top window) start and stop frequencies, "Mkr->CF" on page 368 is first performed. (Note that if this **Mkr->CF** causes the Zoom Region to be outside the new start and stop frequencies, the Zoom Region is re-initialized to the new instrument **Center Frequency** with a span of 10% of the instrument **Span**). After the **Mkr->CF** is performed, **Mkr->Zoom Center** is performed.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:TZOom:CENTer`
Example	Set Zoom **Center Frequency** to the value of Marker 2: `:CALC:MARK2:TZO:CENT`
Notes	Sending this command selects the subopcoded marker If specified marker is **Off**, this command first turns it on at the center of the screen as a **Normal** marker. Then **Mkr->Zoom Center** is performed
Dependencies	Only appears in the **Trace Zoom** View of the Swept SA measurement. If the command is sent in other Views, generates an error

Mkr -> Zone Center

Only appears in the **Zone Span** View.

Moves the zone so that it is centered at the selected marker in the top window. The zone span is not changed. The center frequency of the lower window changes to reflect the new zone center frequency. The lower window will not be updated until it is made active.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:ZSPan:CENTer`
Example	Set Zone **Center Frequency** to the value of Marker 2: `:CALC:MARK2:ZSP:CENT`
Notes	Sending this command selects the subopcoded marker If specified marker is **Off**, this command first turns it on at the center of the screen as a **Normal** marker. Then **Mkr->Zone Center** is performed
Dependencies	Only appears in the **Zone Span** View of the Swept SA measurement. If the command is sent in other Views, gives an error Not available when the bottom window is in **Zero Span**

Move Display Trace -> Marker

Moves the **Display Trace** in the **Waterfall** window to the waterfall trace containing the currently selected marker.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:DTRAce`
Example	Move the **Display Trace** to Marker 2's trace in the **Waterfall** window: `:CALC:MARK2:DTRA`
Notes	Sending this command selects the subopcoded marker If the specified marker is **Off**, this command simply turns it on at the center of the screen, on the current **Display Trace** in the **Waterfall** window
Dependencies	Only appears when the **Waterfall** window is visible

Move Marker -> Display Trace

Moves the Marker in the **Waterfall** window to the current **Display Trace**.

Remote Command	`:CALCulate:MARKer[1]|2|…|12[:SET]:MTRAce`
Example	Move Marker 2 to the **Display Trace** in the **Waterfall** window: `:CALC:MARK2:MTRA`
Notes	Sending this command selects the subopcoded marker If the specified marker is **Off**, this command simply turns it on at the center of the screen, on the current **Display Trace** in the **Waterfall** window
Dependencies	Only appears when the **Waterfall** window is visible

3.2.7.8 Counter

Accesses Marker Counter controls. Does not appear in certain instruments, such as VXT.

Marker Count

Turns the marker frequency counter on or off. The selected marker is counted, and if the selected marker is a **Delta** marker and its reference marker is not **Fixed**, the reference marker is counted as well.

See:

– "Understanding the Marker Counter" on page 375

– "Query Count Value (Remote Query Only)" on page 375

Remote Command	`:CALCulate:MARKer[1]|2|…|12:FCOunt[:STATe] OFF | ON | 0 | 1` `:CALCulate:MARKer[1]|2|…|12:FCOunt[:STATe]?`

Example	`:CALC:MARK2:FCO ON`
	selects marker 2, turns it on, and turns on the counter
	`:CALC:MARK2:FCO:X?`

	returns the counted frequency
Notes	**Fixed** markers are not counted, but a **Fixed** marker will have a count stored in it if it is selected or is the reference marker for the selected marker. The count already in the marker is stored when the marker becomes fixed and if there is none or the marker moves (for example, **Peak Search**) it is counted and stored after the next sweep If a **Fixed** marker has a count stored in it, that count is displayed when the marker is selected, and used as the reference count when that marker is a reference marker If a **Fixed** marker has a count stored in it, that count is deleted if the **Marker X** is adjusted If a **Fixed** marker has a count stored in it, and a search function is performed using the **Fixed** marker while the counter is on, the count stored in the marker is updated If a **Fixed** marker has a count stored in it, and is a reference marker, and the reference is moved to a valid trace point by re-zeroing the delta (by pressing **Delta** again or sending the `DELTa` command) while the counter is on, the count stored in the marker is updated This command causes the specified marker to become selected
Dependencies	Marker Count is unavailable (grayed-out and `OFF`) if the **Gate** function is on
Couplings	If the selected marker is `OFF` when the counter is turned on, the selected marker is set to **Normal** and placed at center of screen on the trace determined by the Marker Trace rules If a marker that is `OFF` is selected while the counter is on, the counter remains on, but since the marker is `OFF`, the count is undefined. In this case the instrument returns Not A Number to a SCPI count query The counter is turned `OFF` when the selected marker is turned `OFF`
Preset	`OFF`
State Saved	The state of the counter (on/off) is saved in instrument state. In the case of Fixed markers, the count stored in the marker is saved in instrument state
Annotation	The absolute count is displayed for **Normal** markers. The difference between the count and the reference marker's count is displayed for **Delta** markers. A **Fixed** marker with no saved count, or a non-**Fixed** marker on a trace which is not updating, will show three dashes in the count block (---), and return not a number to a SCPI count query. This is true when the marker is selected or when it is a reference marker, and its Delta marker is selected Note that when the count is undefined, the Count value (result) itself will display as "---" but any text before or after the value is retained. Hence, an undefined count for Marker 1 (for example) would display as "Cnt1 --- Hz" as long as the value is undefined The format of the frequency counter display is: Cnt<n> <value> where n is the marker number, for example Cnt1 25 386 243 226.493 Hz If the marker is a delta marker then a leading delta symbol appears, as: ΔCnt1 –25 386 243 226.493 Hz The resolution of the frequency counter display is set by the following equation: LSDDisplayed = 10 ^ (floor (–4.7 - log (Gate_Time)) with the further restriction that the displayed resolution must always fall in the 1 Hz to .001 Hz range. Thus, for 2 ms (log 2 ms = –2.69897) and longer gate times, the counter resolution is 0.001 Hz The decimal point location is fixed, without trailing zero suppression. It displays in units of Hz. The

	digits to the left of the decimal have leading zero suppression. For understandability, with more than 4 digits to the left of the decimal point, the digits are grouped in threes, from the decimal point left, with spaces between those groups of three. For negative numbers there is no space between the minus and the number Examples: ΔCnt1 –2226.493 Hz ΔCnt1 –22 226.493 Hz
Backwards Compatibility Notes	In some legacy analyzers (for example, 8560 series) the FreqOffset value was applied to the Marker Count. In others (for example, ESA and PSA) it was not. X-Series follows the ESA/PSA model and does *not* apply Freq Offset to the Marker Count In ESA and PSA, the reference marker for **Delta** markers was always counted. In X-Series the marker is counted for **Normal** and **Delta** markers; but for the reference marker, if it is a **Fixed** marker, we use the count stored in the **Fixed** marker. This enhanced capability may require a change to some user code and/or test procedures

Query Count Value (Remote Query Only)

Queries the frequency count. Returns the absolute count, unless the specified marker is in **Delta** mode, in which case it returns the relative count. If the marker is **Off**, or the marker is on, but the counter is off, the instrument returns Not a Number to a SCPI count query. A marker with no stored count, or a non-**Fixed** marker on a stored trace, also returns Not a Number to a SCPI count query. This result may simply mean that the first sweep after the counter turned on has not yet completed.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:FCOunt:X?`
Notes	Does *not* cause the specified marker to become selected

Understanding the Marker Counter

Using the internal counter we can count the frequency of a marker, but we cannot count while we are actually sweeping. So, once we are done with a sweep, we move to the selected marker frequency and count that frequency. Then, if the marker is a **Delta** marker, the count is also taken for its reference marker. The count is actually performed by moving the LO to the frequency (or frequencies in the case of a **Delta** marker) we wish to count. The count is executed on a marker-by-marker basis and no further count is taken until after the next sweep (even if the marker moves before another sweep has completed).

The **Marker Count** is taken by tuning the instrument to the frequency of the marker and counting the IF, with the instrument not sweeping. The count is adjusted for display by adding or subtracting it (as appropriate) from the LO frequency, so that you see a count that represents the signal frequency. This is true even if External

Mixing is ON. Since all this happens between sweeps, you never see the instrument retuning to do the counts.

If you wish to see the entered frequency of a counted marker it will appear in the active function area when that marker is selected (for Fixed markers, you must press **Marker**, **Fixed** to select Fixed markers, then press it a second time to view or adjust the x or y marker values).

Counting Off-screen Markers

If the selected marker is **Off**, the X-axis the instrument can still be tuned to the marker (unless it is outside the current range of the instrument), so the count can still be displayed. This means you can see a count for an off-screen marker, even though there may be no valid Y-value for the marker. If the marker frequency is outside the range of the instrument, the display shows three dashes in the count block (---), and Not a Number is returned to a SCPI count query.

Delta Marker

When a **Delta** Marker is selected while **Marker Count** is ON:

- If the reference marker is not a **Fixed** marker, the display shows the difference between the count of the selected marker and the count of the reference marker
- If the reference marker is a **Fixed** marker and there is a count stored in the marker (because **Marker Count** was ON when the marker became a **Fixed** marker), the display shows the difference between the count at the marker and the count stored in the reference marker

Marker Count works in **Zero Span** as well as in Swept SA. The instrument tunes to the frequency of the selected marker, which, for active zero span traces, is simply the center frequency of the instrument.

Fixed Markers

Fixed markers have a count stored in them that is generally kept fixed and not updated. If a **Fixed** marker is selected, or used as a reference, the signal at the marker frequency is not counted; rather the stored count is seen or used as the reference. The count is stored, if **Count** is ON, when the marker becomes **Fixed** or when, while **Fixed**, the marker is moved by re-zeroing the reference (if it is the reference marker) or via a peak search (since both of these, by definition, use valid trace data). The count stored in a **Fixed** marker is lost if the counter is turned off, if the marker is moved to an inactive trace, or if the marker is moved by adjusting its x-value.

More Information about Counter

When the counter is ON, the count (or the delta count) for the selected marker is displayed.

The invalid data indicator (*) turns on until the completion of the first count.

Marker Count frequency readings are corrected using the **Freq Offset** function (in some previous instruments, they were not). Note, however, that Marker delta readings are not corrected, as any offset would be applied to both.

In **Zero Span**, on active traces, the counter continues to function, counting any signal near the center frequency of the instrument.

NOTE	No signal farther from the marker frequency than the **Res BW** will be seen by the counter.

The above command turns on or off the frequency counter. If the specified marker number in the command is not the selected marker, it becomes the selected marker. If the specified marker number is not on, `:FCOunt ON` sets it to **Normal** and places it at center of screen on the trace determined by the Marker Trace rules. Once the marker count is on, it is on for any selected marker, not just for the one used in the command. The state query returns 1 only if marker count is on and the specified number is the selected marker. The invalid data indicator (*) turns on until the completion of the first count, but this does not prevent a value from being returned.

Counter Gate

Controls the length of time during which the frequency counter measures the signal frequency. Longer gate times allow for greater averaging of signals whose frequency is “noisy”, though the measurement takes longer. If the gate time is an integer multiple of the length of a power-line cycle (20 ms for 50 Hz power, 16.67 ms for 60 Hz power), the counter rejects incidental modulation at the power line rate. The shortest gate time that rejects both 50 and 60 Hz modulation is 100 ms, which is the value chosen in **Auto**, or on **Preset**, or when "Auto Couple" on page 1995 is pressed.

The start time of the Gate Time of the counter must be controlled by the same trigger parameters as controls the sweep. Thus, if **Trigger** is not **Free Run**, the counter gate must not start until after the trigger is received and delayed.

Remote Command	`:CALCulate:MARKer[1]|2|…|12:FCOunt:GATetime <time>` `:CALCulate:MARKer[1]|2|…|12:FCOunt:GATetime?`
Example	Set the gate time for Marker 2 to 10^{-2} s = 10 ms:

	:CALC:MARK2:FCO:GAT 1e-2
Notes	When **Auto Couple** is pressed, Gate Time is set to 100 ms This command causes the specified marker to become selected
Preset	100 ms
State Saved	Saved in instrument state
Min	1 us
Max	500 ms

Auto Function

Remote Command	:CALCulate:MARKer[1]|2|…|12:FCOunt:GATetime:AUTO OFF | ON | 0 | 1 :CALCulate:MARKer[1]|2|…|12:FCOunt:GATetime:AUTO?
Example	:CALC:MARK2:FCO:GAT:AUTO ON
Preset	ON

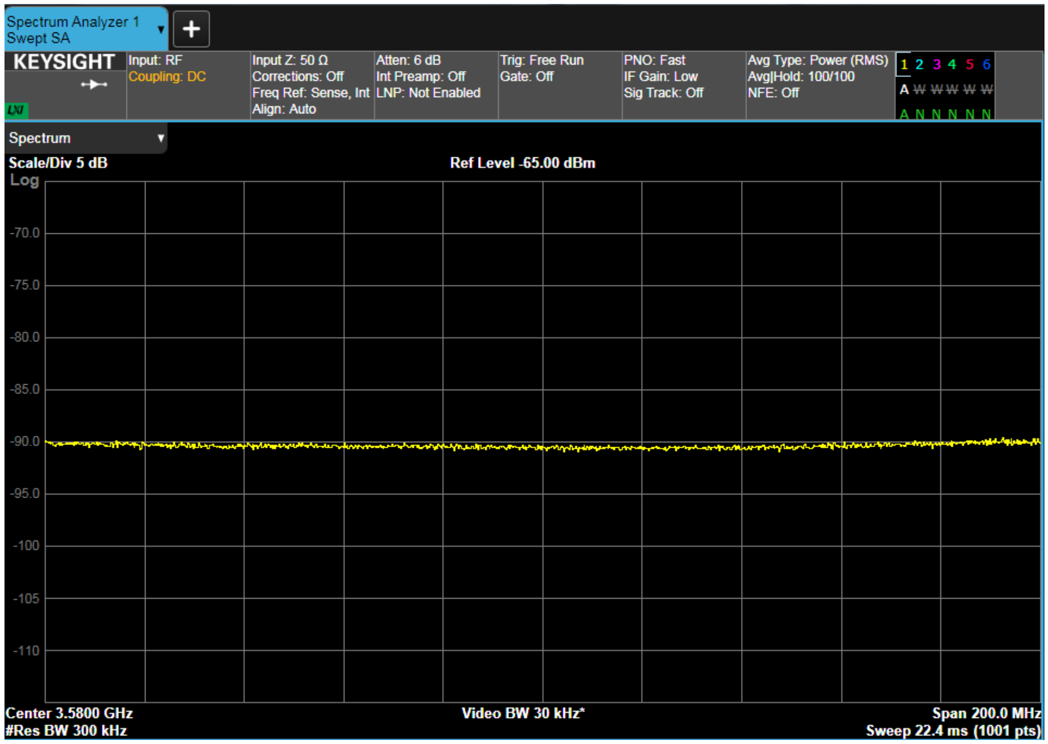
Backwards Compatibility Command

Notes	Provided for ESA compatibility, which allowed you to control the gate resolution, rather than the gate time :CALCulate:MARKer[1]|2|3|4:FCOunt:RESolution <freq> Sets the gate time to 1/freq :CALCulate:MARKer[1]|2|3|4:FCOunt:RESolution? Returns 1/gate_time :CALCulate:MARKer[1]|2|3|4:FCOunt:RESolution:AUTO OFF|ON|0|1 is accepted and ignored :CALCulate:MARKer[1]|2|3|4:FCOunt:RESolution:AUTO? Always returns 1 All these commands cause the marker to become selected
Preset	1Hz
Backwards Compatibility SCPI	:CALCulate:MARKer[1]|2|…|4:FCOunt:RESolution <freq> :CALCulate:MARKer[1]|2|…|4:FCOunt:RESolution?

Auto Function

Remote Command	:CALCulate:MARKer[1]|2|…|4:FCOunt:RESolution:AUTO ON | OFF | 1 | 0 :CALCulate:MARKer[1]|2|…|4:FCOunt:RESolution:AUTO?
Preset	ON

3.2.8 Meas Setup



Contains functions for setting up the measurement parameters and for setting up parameters global to all measurements in the Mode.

NOTE In the **Meas Setup** menu, you may configure Averaging, by setting the Average Number and the Average Type.

3.2.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Average/Hold Number

Sets the terminal count number N for **Average, Max Hold** and **Min Hold** trace types. This number is an integral part of how the average trace is calculated. Basically, increasing N results in a smoother average trace.

See:

– "More Information" on page 380

– "AVERage:CLEar command" on page 381

Remote Command	`[:SENSe]:AVERage:COUNt <integer>` `[:SENSe]:AVERage:COUNt?`
Notes	Note that the SCPI is under the (optional) `SENSe` node; for backwards compatibility
Couplings	Restarting any of these functions (**Average, Max Hold** or **Min Hold)** restarts all of them, as there is only one count
Preset	100
State Saved	Saved in instrument state
Min	1
Max	10000
Annotation	The current average/hold count K is displayed, up to the terminal count N, in the Meas Bar, as **Avg | Hold: K/N** when any active (updating) trace is in Average, Max Hold or Min Hold For example, Trace 2 in Average:, 10 of 100 counts so far: **Avg | Hold: 10/100** If in Continuous, and the Terminal count has been surpassed, the annotation shows as **Avg | Hold: >N/N** For example, Continuous sweep, Trace 2 in Average, Avg/Hold number is 100, but 150 averages have been taken so far: **Avg | Hold: >100/100** No count is displayed if no trace is in Average or Hold
Status Bits/OPC dependencies	See the **Sweep** key description for a discussion of the Sweeping, Measuring, Settling and OPC bits, and the Hi Sweep line. All are affected when a sequence is reset
Backwards Compatibility Notes	In older instruments, when changing the **Average Count** (now **Average/Hold Number**), you had to re-start the trace at the beginning of a sweep to ensure valid average data. Now, the system will ensure valid results when changing the count limit

More Information

When in **Single**, the sweep stops when N is reached. You can add more sweeps by increasing **Average/Hold Number**. For example, if you want to add one more average, or one more trace to Max Hold or Min Hold, simply increment this number by one, which you can do by pressing the **Up** key while **Average/Hold Number** is the active function.

In **Cont** (continuous), averaging and holding continues even after N is reached. Therefore, using doing trace holding in **Cont**, the value of N is irrelevant. But for averaging, each new sweep is exponentially averaged in with a weighting equal to N.

For details of how the average trace is calculated and how this depends on the **Average/Hold Number**, see "Average Type" on page 381, below. For details on how the various control functions in the instrument start and restart averaging, see "Average Type" on page 381.

Average/Hold Number is not affected by "Auto Couple" on page 1995.

AVERage:CLEar command

Resets the average/hold count and performs `:INIT:IMM`, which begins another set of sweeps when trigger conditions are satisfied. It only does this if an active trace is in Average or Hold type.

Remote Command	`[:SENSe]:AVERage:CLEar`

Example	`:AVER:COUN 100`
	`:AVER:CLE`
	sets the current count (k and K) to 1 and restarts the averaging process

Notes	When the instrument receives this command, it performs `:INIT:IMM`, if and only if there is an active trace in Max Hold, Min Hold, or Average type

Average Type

Lets you control the way averaging is done by choosing one of the following averaging scales:

Option	SCPI	Details
Log-Power (Video)	`LOG`	"Log-Pwr Avg (Video)" on page 383
Power (RMS)	`RMS`	"Pwr Avg (RMS)" on page 383
Voltage averaging	`SCALar`	"Voltage Avg" on page 384

Also lets you choose **Auto** (default); see "Auto" on page 382.

These are the averaging processes within the Swept SA measurement, all of which are affected by this setting:

1. Trace averaging (see **Trace** under **Trace Type**) averages signal amplitudes on a trace-to-trace basis. When performing Trace Averaging, the equation that is used to calculate the averaged trace depends on the average type. The average type applies to all traces in Trace Average (it is not set on a trace-by-trace basis)
2. Average detector (see **Trace** under **Detector**) averages signal amplitudes during the time or frequency interval represented by a particular measurement point

3. Noise Marker (see **Marker** under **Marker Function**) averages signal amplitudes across measurement points to reduce variations for noisy signals

4. VBW filtering (see **BW** under **VBW**) adds video filtering which is a form of averaging of the video signal

Remote Command	`[:SENSe]:AVERage:TYPE LOG | RMS | SCALar` `[:SENSe]:AVERage:TYPE?`
Preset	`LOG`
Range	Log-Power (Video) | Power (RMS) | Voltage
Annunciation	Log-Power | Power (RMS) | Voltage Found in the Meas Bar under **Avg Type** When not in Auto, label changes to **#Avg Type**
Backwards Compatibility Notes	The following legacy parameters to the `[:SENSe]:AVERage:TYPE` command are aliased as shown:

Legacy Param	Aliased To
`LINear`	`SCALar`
`VOLTage`	`SCALar`
`VIDeo`	`LOG`
`LPOWer`	`LOG`
`POWer`	`RMS`

Auto Function

Remote Command	`[:SENSe]:AVERage:TYPE:AUTO OFF | ON | 0 | 1` `[:SENSe]:AVERage:TYPE:AUTO?`
Preset	`ON`

Details of each averaging type appear below:

Auto

When **Auto** is selected, the instrument chooses the optimum type of averaging for the current instrument measurement settings. When one of the average types is selected manually, the instrument uses that type regardless of other instrument settings, and shows Man on the **Average Type** toggle.

Here are the auto-select rules for **Average Type:**

Auto selects **VoltageAveraging** if the Detector for any active trace is **EMI Average** or **QPD or RMS Average**; otherwise, it selects **Power (RMS)** Averaging if a **Marker Function** (**Marker Noise**, **Band/Intvl Power**) is on, or **Detector** is set to **Man** and **Average**; otherwise, if **Amplitude**, **Scale Type** is set to **Lin** it selects **Voltage**

Averaging; otherwise, if the EMC Standard is set to CISPR, it selects Voltage; otherwise **Auto** selects **Log-Power** Average.

Note that these rules are only applied to active traces. Traces which are not updating do not impact the auto-selection of Average Type. When you select log-power averaging, the measurement results are the average of the signal level in logarithmic units (decibels). When you select power average (RMS), all measured results are converted into power units before averaging and filtering operations, and converted back to decibels for displaying. Be aware that there can be significant differences between the average of the log of power and the log of the average power.

Log-Pwr Avg (Video)

Selects the logarithmic (decibel) scale for all filtering and averaging processes. This scale is sometimes called “Video” because it is the most common display and analysis scale for the video signal within a spectrum instrument. This scale is excellent for finding CW signals near noise, but its response to noise-like signals is 2.506 dB lower than the average power of those noise signals. This is compensated for in the **Marker Noise** function.

The equation for trace averaging on the log-pwr scale is shown below, where K is the number of averages accumulated. (In continuous sweep mode, once K has reached the **Average/Hold Number**, K stays at that value, providing a continuous running average.)

New avg = ((K−1)Old avg + New data)/K

This equation assumes all values in decibel scale.

Pwr Avg (RMS)

All filtering and averaging processes work on the power (the square of the magnitude) of the signal, instead of its log or envelope voltage. This scale is best for measuring the true time average power of complex signals. This scale is sometimes called RMS because the resulting voltage is proportional to the square root of the mean of the square of the voltage.

In the equation for averaging on this scale (below), K is the number of averages accumulated. (In continuous sweep mode, once K has reached the **Average/Hold Number**, K stays at that value, providing a running average.)

New avg = 10 log $((1/K)((K-1)(10^{\text{Old avg}/10})+10^{\text{New data}/10}))$

This equation assumes all values are in the decibel scale.

Voltage Avg

All filtering and averaging processes work on the voltage of the envelope of the signal. This scale is good for observing rise and fall behavior of AM or pulse-modulated signals such as radar and TDMA transmitters, but its response to noise-like signals is 1.049 dB lower than the average power of those noise signals. This is compensated for in the **Marker Noise** function.

In the equation for averaging on this scale (below), K is the number of averages accumulated. (In continuous sweep mode, once K has reached the **Average/Hold Number**, K stays at that value.)

New avg = 20 log ((1/K)((K−1)($10^{\text{Old avg}/20}$)+$10^{\text{New data}/20}$))

This equation assumes all values are in the decibel scale.

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 385 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter’s coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple***does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Resets the local measurement variables for the currently active measurement to their factory default values. The measurement settings that get reset are a subset of the ones that are reset during a **Mode Preset**. This function keeps the instrument in the current measurement and the current mode and does not affect the settings for other measurements, but does abort the currently running measurement and restarts it.

Remote Command	`:CONFigure:SANalyzer`
Example	`:CONF:SAN`
Notes	Clears the Measuring bit

3.2.8.2 Limits

Contains controls for the Limit Lines of the current measurement. Limits arrays can be user-entered, sent via SCPI, or loaded from a file.

Dependencies	Only appears if you have the proper option installed in your instrument
Preset	Limits are turned off by **Preset**, but the Limits arrays (data) are only reset (deleted) by **Restore Mode Defaults**. They survive shutdown and restarting of the instrument application, which means they will survive a power cycle

Select Limit

Specifies the *selected limit*. The term "selected limit" is used throughout this document to specify which limit is affected by the functions.

Notes	The selected limit is remembered even when not in the **Limits** menu
Preset	Limit 1, not affected by **Mode Preset**, preset by **Restore Mode Defaults**
State Saved	Saved in instrument state

Limit On/Off

Selects whether the limit and margin are displayed. If "Test Limits" on page 400 is ON, this also determines whether the "Test Trace" on page 394 is tested against the limit. If **Limit On/Off** is **On**, the following occurs:

- The limit line is displayed, in the same color as the limited trace, but paler. Portions of traces that fail the limits are displayed in red
- The margin line is displayed if "Margin" on page 388 is ON and the Margin Value is non-zero. The margin line is displayed in the same color as the limit line, but paler still and dashed. Portions of traces that pass the limits but fail the margin are displayed in amber
- The trace is tested for the purpose of the “Trace Pass/Fail” indication in the graticule if, in addition to **Limit On/Off** being **On,** the trace is displayed and "Test Limits" on page 400 is ON. If the trace is not tested, no report of the trace passing or failing is seen on the graticule. Note that the SCPI queries for Limit Pass/Fail are independent of these conditions; the test is always performed when queried via SCPI

The **PASS/FAIL** box in the corner of the **Meas Bar** is only displayed if there is at least one “Trace Pass/Fail” indication displayed in the graticule.

Note that the red and amber coloring of traces that fail the limits and/or margins only apply to traces whose X-axis corresponds to the current instrument X-axis. Traces that are not updating (in **View**, for example) do not change color if the instrument X-axis settings (for example, **Start Freq** and **Stop Freq**) do not match those of the trace, for example if they have been changed since the trace stopped updating. In this case, the Invalid Data indicator (*) appears in the upper right-hand corner.

When the limits are frequency limits, but the trace is a zero-span trace, the limit trace is drawn at the limit amplitude of the center frequency. When the limits are time limits, but the trace is a frequency domain trace, the limit trace is drawn according to the current time axis, with the left of the screen being 0 and the right being equal to sweep time.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:DISPlay OFF | ON | 0 | 1` `:CALCulate:LLINe[1]|2|…|6:DISPlay?`
Example	Turn on the display for Limit Line 2: `:CALC:LLIN2:DISP ON`
Dependencies	Generates an “Option not available” error message unless you have the proper option installed in your instrument
Couplings	Limit display ON selects the limit Testing is done on all displayed limits if **Test Limits (All Limits)** is ON

	Entering the limit menu from the user interface turns on the selected limit
Preset	`OFF`
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`:CALCulate:LLINe[1]|2:STATe OFF | ON | 0 | 1`

Margin

Selects a **Margin** for this limit, which causes a trace to Fail Margin when the trace is between the Limit Line and the Margin Line. Portions of the traces that pass the limit but fail the margin are displayed in amber.

A margin is always specified in dB relative to a limit – an upper limit always has a negative margin, and a lower limit always has a positive margin. If a value is entered with the incorrect sign, the system automatically takes the negative of the entered value.

If the limit type is switched from lower to upper while margin is present, the margin reverses sign.

When the Margin is selected, it may be turned off by pressing the **Margin** control until the toggle is next to **Off**. This may also be done by performing a preset. **Margin** is the default active function whenever the margin is on, and it is not the active function whenever the margin is off.

Margin lines are displayed in the same color as limit lines, but paler . If the limited trace is blanked then the limit line and the margin line are also blanked.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:MARGin <rel_ampl>` `:CALCulate:LLINe[1]|2|…|6:MARGin?`

Example	Set Limit Line 1's margin to -2 dB (Limit Line 1 is by default an upper limit):
	`:CALC:LLIN1:MARG -2dB`
	Set Limit Line 2's margin to 1 dB (Limit Line 2 is by default a lower limit):
	`:CALC:LLIN2:MARG 1dB`

Notes	The queries "Limit Line Fail?" (`:CALCulate:LLINe[1]|2|3|4|5|6:FAIL?`) and "Trace Fail?" (`:CALCulate:TRACe[1]|2|3|4|5|6:FAIL?`) return 1 if the margin fails
Couplings	Affects `:CALC:LLIN3:FAIL` or `:CALC:TRAC2:FAIL?`
Preset	Not affected by **Mode Preset**, set to 0 dB for all Limits by **Restore Mode Defaults**
State Saved	Saved in instrument state
Min	–40 dB (Upper); 0 dB (Lower)
Max	0 dB (Upper); 40 dB (Lower);

Auto Function

Remote Command	`:CALCulate:LLINe[1]|2|…|6:MARGin:STATe OFF	ON	0	1` `:CALCulate:LLINe[1]|2|…|6:MARGin:STATe?`
Example	Turn off the margin for Limit Line 2 and remove any tests associated with that margin line: `:CALC:LLIN2:MARG:STAT OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Type

Selects whether the limit you are editing is an upper or lower limit. An upper limit fails if the trace exceeds the limit. A lower limit fails if the trace falls below the limit.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:TYPE UPPer	LOWer` `:CALCulate:LLINe[1]|2|…|6:TYPE?`
Example	Set Limit Line 2 to act as a lower limit: `:CALC:LLIN2:TYPE LOW`
Couplings	If a margin has already been set for this limit line, and this control is used to change the limit type, then the margin value reverses sign
Preset	Upper for Line 1, 3, and 5; Lower for Line 2, 4, 6 Not affected by **Mode Preset**, preset by **Restore Mode Defaults**
State Saved	Saved in instrument state

Edit Limit

Lets you edit the content and the properties of the Limit Line.

When entering the menu, the editor window (with the limit table) turns on, the selected Limit is turned **On**, and the amplitude scale is set to **Log**. The display of the trace to which the selected limit applies is turned on (thus, traces in **Blank** are set to **View** and traces in **Background** are set to **On**). Turning on the Limit means its display will be on, and its testing mode will be on as well. You should turn off any other limits that are on if they interfere with the editing of the selected limit.

NOTE **The table editor will only operate properly if the instrument is sweeping, because its updates are tied to the sweep system. Thus, you should not try to use the editor in single sweep, and it will be sluggish during compute-intensive operations like narrow-span FFT sweeps.**

Remote users can enter or access limit line data via the "Limit Line Data (Remote Command Only)" on page 402 command.

After exiting the editor, the Limit is still on and displayed, and the amplitude scale remains **Log**.

Limits are turned off by **Preset**, but the Limits arrays (data) are only reset (deleted) by **Restore Mode Defaults**. They survive shutdown and restarting of the instrument application, which means they will survive a power cycle.

When editing a limit, the editor remembers which limit and which element in the limit array you were editing, and returns you to that limit and that element when you return to the editor after leaving it.

Couplings	Turns the ΔLimit Peaks table off

Select Limit

Specifies the selected limit. The term “selected limit” is used throughout this document to specify which limit is affected by the functions.

Notes	The selected limit is remembered even when not in the Limit Menu
Preset	Limit 1, not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state

Go To Row

Lets you move through the table to edit the desired point.

Min	1
Max	2000

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray. To enter the row into the table, press the **Enter** key, or tap either value then edit it.

Scale X Axis

Matches the X Axis to the selected Limit, as closely as possible.

For frequency limits and a frequency-domain X-axis, sets **Start Freq** and **Stop Freq** to contain the minimum and maximum Frequency of the selected Limit.

– For linear Frequency Scale, the range between **Start Freq** and **Stop Freq** is 12.5% above the range between the minimum and maximum frequency, so that span exceeds this range by one graticule division on either side (but never set **Start Freq** below 0 Hz nor **Stop Freq** above the maximum instrument frequency)

– For log Frequency Scale, **Start Freq** is set to the bottom of the decade in which the minimum frequency of the Limit appears, and **Stop Freq** is set to the top of the decade in which the maximum frequency of the Limit appears. In either case, if the frequency is at a decade boundary, we take that boundary as being the bottom/top of the decade in which the frequency appears. Example: Limit goes from 150 kHz to 1 GHz, set Start Freq to 100 kHz, Stop Freq to 1 GHz

For time limits and a time-domain X-axis, sets the sweep time to match the maximum Time of the selected Limit.

If the domain of the selected limit does not match the domain of the X Axis, no action is taken. Standard clipping rules apply, if the value in the table is outside the allowable range for the X axis.

Dependencies	If either the first or last point in the array is outside the frequency range of the current input, an error message is generated: "-221. Settings conflict; Start or Stop Freq out of range for current input settings"

X Offset

Offsets the limit trace by some specified frequency (for frequency-based limit lines) or a time (for time-based limit lines).

Remote Command	`:CALCulate:LLINe[1]|2|…|6:OFFSet:X <value>`
	`:CALCulate:LLINe[1]|2|…|6:OFFSet:X?`
	`<value>` = `<freq>` if Limit X-Axis Unit is Frequency
	`<value>` = `<time>` if Limit X-Axis Unit is Time

Example	Set the X axis offset to –50 MHz:
	`:CALC:LLIN:OFFS:X -50MHZ`
	Apply the X axis offset to all points in the limit line, then reset the X axis offset to zero:
	`:CALC:LLIN:OFFS:UPD`

Preset	0 Hz if Limit X-Axis Unit is Frequency 0 s if Limit X-Axis Unit is Time
State Saved	Saved in instrument state, survives Preset
Min	–500 GHz
Max	500 GHz
Annotation	When the offset is non-zero, the title of the limit table will include the words "[Offset Pending]"

Y Offset

Offsets all segments in the limit line by some specified amplitude.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:OFFSet:Y <rel ampl>` `:CALCulate:LLINe[1]|2|…|6:OFFSet:Y?`

Example	Set the Y axis offset to –3 dB:
	`:CALC:LLIN:OFFS:Y -3 dB`
	Apply the Y axis offset to all points in the limit line, then reset the Y axis offset to zero:
	`:CALC:LLIN:OFFSet:UPD`

Preset	0 dB
State Saved	Saved in instrument state
Min/Max	–/+Infinity
Annotation	When the offset is non-zero, the title of the limit table includes the words “[Offset Pending]”

Apply Offsets to Limit Table

Adds the X and Y offsets to each point in the limit table, then resets the X and Y offset values to zero. This has no effect on the position of the limit trace.

For example, if the X offset is –10 MHz and the Y offset is 1 dB, the values in the limit table are updated as follows: 10 MHz is subtracted from each X value, 1 dB is added to each Y value. The offset values are then reset to zero. The limit trace is not moved, and the limit table is updated to accurately reflect the currently-displayed limit trace.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:OFFSet:UPDate`
Example	Set updates the limit table to reflect the X and Y offsets, then reset the offsets to zero: `:CALC:LLIN:OFFS:UPD`
State Saved	No state

Delete Row

This is an immediate action key. It immediately deletes the currently-selected row, whether or not that row is being edited. The row following the currently-selected row (or the row preceding if there is none) is selected.

Delete Limit

Deletes the currently selected limit line. Pressing **Delete Limit** purges the data from the limit line tables.

Limit data – including secondary parameters such as description, margin value, etc. – is cleared and returned to factory preset settings.

When this control is pressed, a prompt is placed on the screen that says “Please press Enter or OK to delete limit. Press ESC or Cancel to close this dialog.” The deletion is *only* performed if you press **OK** or **Enter**. Following deletion, the informational message **Limit deleted** appears in the MSG line.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:DELete`
Example	Delete all data for Limit Line 2: `:CALC:LLIN2:DEL`

Limit Table

Lets you configure the properties of the current row of the Limit Table.

Frequency

Lets you edit the frequency of the current row.

Min	0
Max	1 THz

Amplitude

Lets you edit the Amplitude of the current row.

Min	–1000 dBm
Max	1000 dBm

Limit Graph

Lets you edit the limit line visually. Each node in the limit line is represented by a gray circle. The current node has a blue outline in the table and a blue circle in the graph. Touch any circle and drag it where you want it to go.

Edit Limit Settings

Opens another menu page that lets you set certain properties of the selected Limit, such as Test Trace, Interpolation, Reference, Fixed/Relative, Description and Comment.

The facility to build a Limit from a Trace and to Copy Limits to other Limits is also found here.

Select Limit

Specifies the *selected limit*. The term “selected limit” is used throughout this document to specify which limit is affected by the functions.

Notes	The selected limit is remembered even when not in the Limit Menu
Preset	Limit 1, not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state

Test Trace

Selects the trace you want the limit to test. A limit is applied to one and only one trace; each trace can have both an upper and a lower limit. When executing Limit Test, the limit is applied only to the specified trace.

A trace can have multiple limit lines simultaneously; in that case, only one upper and one lower limit line will affect the color of the trace. Other limit lines are displayed, and will affect the pass/fail status, but the trace will not turn red if it crosses a secondary limit line.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:TRACe 1 | … | 6` `:CALCulate:LLINe[1]|2|…|6:TRACe?`
Example	Apply limit 3 to trace 2: `:CALC:LLIN3:TRAC 2`
Notes	When the trace display is off, the trace is not tested. The trace is tested only when the trace display is on and "Test Limits" on page 400 is ON
Couplings	This matters when testing a trace or limit line for failure, via `:CALC:LLIN3:FAIL?` or `:CALC:TRAC2:FAIL?`
Preset	Limits 1 and 2 preset to 1, Limits 3 and 4 preset to 2, Limits 5 and 6 preset to 3 Not affected by **Mode Preset**, preset by **Restore Mode Defaults**
State Saved	Saved in instrument state
Min	1
Max	6

Frequency Interpolation

This control is grayed-out if Time is the selected X Axis Unit.

Sets the interpolation between frequency points, allowing you to determine how limit trace values are computed between points in a limit table. The available interpolation modes are linear and logarithmic. If frequency interpolation is logarithmic (Log), frequency values between limit points are computed by first taking the logarithm of both the table values and the intermediate value. A linear interpolation is then performed in this logarithmic frequency space. An exactly analogous manipulation is done for logarithmic amplitude interpolation.

Note that the native representation of amplitude is in dB.

For linear amplitude interpolation and linear frequency interpolation, the interpolation is computed as:

$$y = 20\log\left(\frac{10^{\frac{y_{i+1}}{20}} - 10^{\frac{y_i}{20}}}{f_{i+1} - f_i}\left(f - f_i\right) + 10^{\frac{y_i}{20}}\right)$$

For linear amplitude interpolation and log frequency interpolation, the interpolation is computed as:

$$y = 20\log\left(\frac{10^{\frac{y_{i+1}}{20}} - 10^{\frac{y_i}{20}}}{\log f_{i+1} - \log f_i}\left(\log f - \log f_i\right) + 10^{\frac{y_i}{20}}\right)$$

For log amplitude interpolation and linear frequency interpolation, the interpolation is computed as:

$$y = \frac{y_{i+1} - y_i}{f_{i+1} - f_i}\left(f - f_i\right) + y_i$$

For log amplitude interpolation and log frequency interpolation, the interpolation is computed as:

$$y = \frac{y_{i+1} - y_i}{\log f_{i+1} - \log f_i}\left(\log f - \log f_i\right) + y_i$$

NOTE	Interpolation modes determine how limit values are computed between points in the limit table. The appearance of a limit trace is also affected by the amplitude scale, which may be linear or logarithmic.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:CONTrol:INTerpolate:TYPE LOGarithmic	LINear` `:CALCulate:LLINe[1]|2|…|6:CONTrol:INTerpolate:TYPE?`
Example	Set Limit Line 1 frequency interpolation to linear: `:CALC:LLIN:CONT:INT:TYPE LIN`
Preset	`LINear` Not affected by **Mode Preset**, preset by **Restore Mode Defaults**
State Saved	Saved in instrument state

Freq Reference

Specifies whether the limit line frequency points are coupled to the instrument **Center Frequency**, and whether the frequency points are expressed as an offset from the instrument **Center Frequency**. If the limit lines are specified with time, this has no effect. The limit table must in this case support negative frequencies.

For example, assume you have a frequency limit line, and the instrument **Center Frequency** is 1 GHz. If Relative to CF is **Off**, entering a limit line segment with a frequency coordinate of 300 MHz displays the limit line segment at 300 MHz, and the limit line segment does not change frequency if **Center Frequency** changes. If Relative to CF is **On**, entering a limit line segment with a frequency coordinate of 300 MHz displays the limit line segment at CF + 300 MHz, or 1.3 GHz. Furthermore, if **Center Frequency** changes to 2 GHz, the limit line segment is displayed at CF + 300 MHz, or 2.3 GHz.

It is possible to change this setting after a limit line has been entered. When changing from **On** to **Off** or *vice versa*, the frequency values in the limit line table change so that the limit line remains in the same position for the current frequency settings of the instrument.

Pressing this button makes **Center Frequency** the active function.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:FREQuency:CMODe:RELative ON	OFF	1	0` `:CALCulate:LLINe[1]|2|…|6:FREQuency:CMODe:RELative?`
Example	Make Limit Line 1 relative to **Center Frequency**: `:CALC:LLIN:FREQ:CMOD:REL ON`
Notes	If the Trace Domain is changed to Time (`:CALCulate:LLINe:CONTrol:DOMain TIME`), `:CALCulate:LLINe[1]|2|3|4|5|6:FREQuency:CMODe:RELative ON|OFF|1|0` has no effect
Couplings	Pressing this control makes **Center Frequency** the active function

Preset	`OFF` Not affected by **Mode Preset**, preset by **Restore Mode Defaults**
State Saved	Saved in instrument state

Amplitude Interpolation

Sets the interpolation to linear or logarithmic for the specified limiting points set, allowing you to determine how limit trace values are computed between points in a limit table. See Frequency Interpolation for the equations used to calculate limit values between points.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:AMPLitude:INTerpolate:TYPE LOGarithmic | LINear` `:CALCulate:LLINe[1]|2|…|6:AMPLitude:INTerpolate:TYPE?`
Example	Set Limit Line 1 amplitude interpolation to linear: `:CALC:LLIN:AMPL:INT:TYPE LIN`
Preset	`LOGarithmic` Not affected by **Mode Preset**, preset by **Restore Mode Defaults**
State Saved	Saved in instrument state

Amptd Reference

Specifies whether the limit line amplitude points are coupled to the instrument reference level, and whether the amplitude points are expressed as an offset from the instrument reference level.

For example, assume you have a limit line, and the reference level at –10 dBm. If Relative to RL is **Off**, entering a limit line segment with an amplitude coordinate of –20 dB displays the limit line segment at –20 dBm, and the limit line segment will not change amplitude if the reference level amplitude changes. If Relative to RL is **On**, entering a limit line segment with an amplitude coordinate of –20 dB displays the limit line segment at RL – 20 dB, or –30 dBm. Furthermore, if the reference level amplitude changes to –30 dBm, the limit line segment is displayed at RL – 20 dB, or –50 dBm.

It is possible to change this setting after a limit line has been entered. When changing from **On** to **Off** or *vice versa*, the amplitude values in the limit line table change so that the limit line remains in the same position for the current reference level settings of the instrument.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:AMPLitude:CMODe:RELative ON | OFF | 1 | 0` `:CALCulate:LLINe[1]|2|…|6:AMPLitude:CMODe:RELative?`
Example	Make Limit Line 1 relative to the reference level amplitude: `:CALC:LLIN:AMPL:CMOD:REL ON`

Couplings	Pressing this button makes **Reference Level** the active function
Preset	`OFF` Not affected by **Mode Preset**, preset by **Restore Mode Defaults**
State Saved	Saved in instrument state

Fixed / Relative Limit (Remote Command Only)

Sets both **Relative to CF** and **Relative to RL** simultaneously for all limits.

The query returns whether Limit Line 1 is set Relative to CF, and ignores all other fixed/relative data.

Example	Make all limit lines relative to center frequency and reference level: `:CALC:LLIN:CMOD REL`

Notes	Supported for Backwards Compatibility
	PSA offers only the following softkey, which is generic to all limit lines: Limits Fixed / Rel
	In X-Series A-Models, this functionality is provided by a softkey that is specific to each limit line, and which provides a sub-menu with 2 softkeys (Relative to CF / Relative to RL)
	In X-Series B-Models, this functionality is provided by two controls (**Freq Reference** and **Amptd Reference**) that are specific to each limit line)
	The legacy `:CALCulate:LLINe:CMODe?` query returns 1 if Limit Line 1 is set **Relative to CF**, and returns 0 otherwise, to be consistent with the implementation of the following X-Series commands:
	`:CALCulate:LLINe[1]|2|…|6:FREQuency:CMODe:RELative ON | OFF | 1 | 0`
	`:CALCulate:LLINe[1]|2|…|6:FREQuency:CMODe:RELative?`
	and
	`:CALCulate:LLINe[1]|2|…|6:AMPLitude:CMODe:RELative ON | OFF | 1 | 0`
	`:CALCulate:LLINe[1]|2|…|6:AMPLitude:CMODe:RELative?`

Preset	Fixed
Backwards Compatibility SCPI	`:CALCulate:LLINe:CMODe FIXed | RELative` `:CALCulate:LLINe:CMODe?`

Copy from Limit

Copies an existing limit into the specified limit, including all secondary parameters (Description, Associated Trace, Type, Margin, Interpolation, and Relative to CF/RL). The destination limit is specified as a subopcoded `LLINe` parameter and the source limit is specified as a numeric parameter.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:COPY 1 | … | 6`

Example	Copy the data from line 1 into line 2: `:CALC:LLINE2:COPY 1`
Notes	The form is `:CALCulate:<destination>:COPY <source>`

Copy

Copies a Limit from the Limit specified in Copy From Limit

Build from Trace

Builds a limit using an existing trace. This command overwrites all data in the limit. Since a straight copy would typically have hundreds or thousands of segments, the data is approximated to better represent a limit line; small excursions whose width is less than 10 trace buckets are sometimes not captured. Secondary parameters that are not associated with traces (Description, Associated Trace, Type, Margin, Interpolation, Relative to CF/RL) are unchanged.

When taking a trace to build a limit, it often works well to take the trace with a resolution bandwidth wider than the expected measurement, a video bandwidth lower than the expected measurement, and with the detector set to Max Hold or Min Hold.

Note that an upper limit is built above the trace, while a lower limit is built below the trace. If the trace is constant, the limit should pass after being built.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:BUILd TRACE1	…	TRACE6`
Example	Builds Limit Line 2 based on the data in trace 1. This overwrites the data in the table editor: `:CALC:LLIN2:BUIL TRACE1`

Build

Builds a Limit from the Trace specified in "Build from Trace" on page 399.

Description

Provides a description of up to 60 characters by which the operator can easily identify the limit. The value is stored in the exported file.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:DESCription “Description”` `:CALCulate:LLINe[1]|2|…|6:DESCription?`
Example	`:CALC:LLIN:DESC “European Emissions”`

Dependencies	60 characters max
Preset	“” (null String), not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`:CALCulate:LLINe[1]|2|…|6::TITLe:DATA “Description”` `:CALCulate:LLINe[1]|2|…|6::TITLe:DATA?`

Comment

Sets an ASCII-text comment field, which is stored in an exported file. Can be displayed in the active function area by selecting as the active function, if desired to be in a screen capture. The Limits CSV file supports this field.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:COMMent "text"` `:CALCulate:LLINe[1]|2|…|6:COMMent?`
Example	`:CALC:LLIN1:COMM "this is a comment"`
Dependencies	60 characters max
Preset	“” (null String), not affected by Mode Preset, preset by Restore Mode Defaults
State Saved	Saved in instrument state
Annotation	When **Trace Annotation** under **Display** is ON, limit comment is displayed as part of the label next to the limit line on the graph

Test Limits

Selects whether displayed traces are tested against displayed limits (that is, those for which **Limit On/Off** is set to ON).

For each displayed trace for which a Limit is turned on, a message is displayed in the upper-left corner of the graticule to notify whether the trace passes or fails the limits.

If the trace is at or within the bounds of all applicable limits and margins, the text “Trace x Pass” is displayed in green, where x is the trace number. A separate line is used for each reported trace.

If the trace is at or within the bounds of all applicable limits, but outside the bounds of some applicable margin, the text “Trace x Fail Margin” is displayed in amber, where x is the trace number. A separate line is used for each reported trace. If the trace is outside the bounds of some applicable limits, the text “Trace x Fail” is displayed in red, where x is the trace number. A separate line is used for each reported trace. If the trace has no enabled limits, or the trace itself is not displayed, no message is displayed for that trace.

The **PASS/FAIL** box in the corner of the **Meas Bar** is only displayed if there is at least one “Trace Pass/Fail” indication displayed in the graticule.

If two amplitude values are entered for the same frequency, a single vertical line is the result. In this case, if an upper line is chosen, the lesser amplitude is tested. If a lower line is chosen, the greater amplitude is tested.

This command only affects the display, and has no impact on remote behavior. Limit queries over SCPI test the trace against the limit regardless of whether the trace or the limit is turned on (exception: `:CALCulate:TRACe[1]|2|3|4|5|6:FAIL?` tests only the limits that are turned on for that trace).

Remote Command	`:CALCulate:LLINe:TEST OFF | ON | 0 | 1` `:CALCulate:LLINe:TEST?`
Example	Turn on testing, and display the results in the upper left corner: `:CALC:LLIN:TEST ON`
Preset	`ON` Not affected by **Mode Preset**, preset by **Restore Mode Defaults**
State Saved	Saved in instrument state
Annotation	If this is on, the active limit window displays the information above regarding pass/fail for each displayed limit

X-Axis Unit

Selects how the limit-line segments are defined. Pressing **X-Axis Unit** selects whether the limit lines are entered using frequency (Freq) or sweep time (Time) to define the segments. They can be specified as a table of limit-line segments of amplitude versus frequency, or of amplitude versus time.. When the X-Axis Unit is set to Time, a time value of zero corresponds to the start of the sweep, which is at the left edge of the graticule, and the column and control in the Limit Table Editor reads Time instead of Frequency

Switching the limit-line definition between Freq and Time erases all the current limit lines. When you do this from the front panel, a warning dialog appears letting you know that you are about to erase all the limit lines, and prompting you to hit “OK” if you are sure:

Caution: Changing X-Axis Unit erases all your limit lines. Are you sure you want to do this? Press Enter or OK to proceed, or Cancel(Esc) to cancel

Remote Command	`:CALCulate:LLINe:CONTrol:DOMain FREQuency | TIME` `:CALCulate:LLINe:CONTrol:DOMain?`
Example	`:CALC:LLIN:CONT:DOM FREQ` deletes all currently existing limit lines, then sets all limit lines to be specified in terms of frequency
Couplings	Affects all limit lines simultaneously, and resets all limit line data except the `.wav` file and email

	address stored in the Actions
Preset	`FREQ` Not affected by **Mode Preset**, preset by **Restore Mode Defaults**
State Saved	Saved in instrument state

Delete All Limits

Deletes all limit lines. Pressing **Delete All Limits** purges the data from all limit line tables.

All limit data is cleared and returned to factory preset settings.

When this control is pressed a prompt is placed on the screen that says “Please press Enter or OK to delete all limits. Press **ESC** or **Cancel** to close this dialog.” The deletion is only performed if you press **OK** or **Enter**. Following deletion, the informational message “All Limits deleted” appears in the MSG line.

Remote Command	`:CALCulate:LLINe:ALL:DELete`
Example	`:CALC:LLIN:ALL:DEL` deletes all data for all limit lines

Limit Line Data (Remote Command Only)

Defines the limit line values, and destroys all existing data. Up to 200 points may be defined for each limit using the following parameters.

`<x>`	Frequency or time values as specified by `:CALCulate:LLINe:CONTrol:DOMain`. Units are not sent in the command but are taken to be fundamental units (Hz or seconds) Range: –30 Gs to +30 Gs for time limits, –3 kHz to +350 GHz for frequency limits
`<ampl>`	Amplitude units are not sent in the command but are taken to be the current Y Axis Unit. Up to two amplitude values can be provided for each x-axis value, by repeating <x-axis> in the data list Range: –1000 dBm to +1000 dBm
`<connect>`	connect values are either "0" or "1." A "1" means this point is connected to the previously defined point to define the limit line. A "0" means that it is a point of discontinuity and is not connected to the preceding point. The connect value is ignored for the first point

Example	`:CALC:LLIN3:DATA 1E9,-20,0,2E9,-20,1,2E9,-10,1,3E9,-10,1` describes a stair-stepped limit line
Preset	Limit line data is cleared by Restore Mode Defaults. However, it survives shutdown/restart of the instrument application (including power cycle)

State Saved	Saved in instrument state
Backwards Compatibility SCPI	`:CALCulate:LLINe[1]|2|…|6:DATA <x>,<ampl>,<connect>` `:CALCulate:LLINe[1]|2|…|6:DATA?`
Backwards Compatibility Notes	In the past it was possible to query the limit trace as though it were a normal trace. The query of the limit trace is not supported in the X-series

Merge Limit Line Data (Remote Command Only)

Adds the points with the specified values to the current limit line, allowing you to merge limit line data. Up to two amplitude values are allowed for each X value. If more than 200 points are entered to be merged, the first 200 points are merged, then an error message 'too many DATA entries' is reported.

`<x>`	Frequency or time values as specified by `:CALCulate:LLINe:CONTrol:DOMain`. Units are not sent in the command but are taken to be fundamental units (Hz or seconds) Range: –30 Gs to +30 Gs for time limits, –3 kHz to +350 GHz for frequency limits
`<ampl>`	Amplitude units are not sent in the command but are taken to be the current Y Axis Unit. Up to two amplitude values can be provided for each x-axis value, by repeating <x-axis> in the data list Range: –1000 dBm to +1000 dBm
`<connect>`	connect values are either "0" or "1." A "1" means this point is connected to the previously defined point to define the limit line. A "0" means that it is a point of discontinuity and is not connected to the preceding point. The connect value is ignored for the first point

Example	`:CALC:LLIN1:DATA:MERG 1000000000,-20,0,2000000000,-30,1` merges the 10 GHz segment and the 20 GHz segment into limit line 1. Note that the 20 GHz segment is connected to the next lower point, which may or may not be the 10 GHz point
Preset	Fixed
Backwards Compatibility SCPI	`:CALCulate:LLINe[1]|2|…|6:DATA:MERGe <x-axis>,<ampl>,<connect>`

Limit Test Current Results (Remote Command Only)

Queries the status of the current measurement limit testing. It returns a 0 if the measured results pass when compared with the current limits. It returns a 1 if the measured results fail any limit tests.

Remote Command	`:CALCulate:CLIMits:FAIL?`

Example	`:CALC:CLIM:FAIL?` queries the current measurement to see if it fails the defined limits Returns a 0 or 1: 0 it passes, 1 it fails

Limit Line Fail? (Remote Command Only)

Tests a limit line against its associated trace. Returns a 0 if the trace is within the limit and margin, a 1 if the trace exceeds either the limit or the margin.

Note that this command only tests one limit line – other limit lines are not tested when executing this command. To see whether a trace passed all limits, use `:CALCulate:TRACe:FAIL?`.

Note this command performs the test regardless of whether the trace or the limit is turned on the display.

Remote Command	`:CALCulate:LLINe[1]|2|…|6:FAIL?`
Example	`:CALC:LLIN:FAIL?` returns a zero if limit line 1's associated trace has no failure, 1 if there is a margin or limit failure

Limit Line Control (Remote Commands Only)

Defines a list of limit line control (frequency or time) values for a given limit line. Up to 2000 points may be defined for each limit using the following parameters.

`<x>`	Frequency or time values as specified by `:CALCulate:LLINe:CONTrol:DOMain`. Units default to Hz (for frequency) and seconds (for time) Range: –30 Gs to +30 Gs for time limits, –3 kHz to +1200 GHz for frequency limits

Note that X values may be repeated if a vertical step in the limit line is desired.

The points query returns the number of points in the control. It should match the number of points in the amplitude, that is, the number of values for the CONTrol axis and for the corresponding UPPer and/or LOWer limit lines must be identical. If one array is larger than the other, the limit trace is built using only as much data as is contained in the smaller array.

An empty array returns not a number (9.91e+37 to a data query), 0 to a `POINts` query.

Remote Command	`:CALCulate:LIMit[1]|2|…|6:CONTrol[:DATA] <x>, <x>, …` `:CALCulate:LIMit[1]|2|…|6:CONTrol[:DATA]?`
Example	`:CALC:LIM:CONT 1GHz,2GHz,2GHz,3GHz` describes the X values of a stair-stepped limit line

Preset	Limit line data is cleared by Restore Mode Defaults
State Saved	Saved in instrument state

Remote Command	`:CALCulate:LIMit[1]|2|…|6:CONTrol:POINts?`
Example	`:CALC:LIM:CONT:POIN?` returns the number of points in the limit line
Preset	Limit line data is cleared by Restore Mode Defaults
State Saved	Yes

Limit Line Upper / Lower (Remote Commands Only)

Defines a list of amplitude values for a given limit line. Changing the number of elements in the list spectrum will automatically turn the limit line off. Using the “UPP” syntax defines an upper limit line, using the “LOW” syntax defines a lower limit line. Note that a line may not be simultaneously both upper and lower; the type of the limit line will automatically be changed as appropriate. Up to 200 points may be defined for each limit using the following parameters.

`<ampl>`	Amplitude units are not sent in the command but are taken to be the current Y Axis Unit Range: –200 dBm to +100 dBm

The points query returns the number of points in the amplitude list. It should match the number of points in the control, that is, the number of values for the `CONTrol` axis and for the corresponding UPPer and/or LOWer limit lines must be identical. If one array is larger than the other, the limit trace is built using only as much data as is contained in the smaller array.

An empty array returns the system error message “list is empty” to a data query, 0 to a `POINts` query.

Remote Command	`:CALCulate:LIMit[1]|2|…|6:UPPer[:DATA] <ampl>, <ampl>, …` `:CALCulate:LIMit[1]|2|…|6:UPPer[:DATA]?`
Example	`:CALC:LIM:UPP -10, -10, -20, -20` describes the amplitude values of an upper limit line
Preset	Limit line data is cleared by Restore Mode Defaults
State Saved	Saved in instrument state

Remote Command	`:CALCulate:LIMit[1]|2|…|6:UPPer:POINts?`
Example	`:CALC:LIM:UPP:POIN?` returns the number of points in the upper limit line
Preset	Upper Limit line data/points is cleared by Restore Mode Defaults
State Saved	Saved in instrument state

Remote Command	`:CALCulate:LIMit[1]|2|…|6:LOWer[:DATA] <ampl>, …` `:CALCulate:LIMit[1]|2|…|6:LOWer[:DATA]?`
Example	`:CALC:LIM:LOW -10, -10, -20, -20` describes the amplitude values of a lower limit line
Preset	Limit line data is cleared by Restore Mode Defaults
State Saved	Saved in instrument state

Remote Command	`:CALCulate:LIMit[1]|2|…|6:LOWer:POINts?`
Example	`:CALC:LIM:UPP:POIN?` returns the number of points in the lower limit line
Preset	Limit line data/points is cleared by Restore Mode Defaults
State Saved	Saved in instrument state

Limit Fail? (Remote Query Only)

Tests a limit line against its associated trace. Returns a 0 if the trace is within the limit and margin, a 1 if the trace exceeds either the limit or the margin. This query is identical to `:CALC:LLIN:FAIL?`

Note that this query only tests one limit line – other limit lines are not tested when executing this command. To see whether a trace passed all limits, use `:CALCulate:TRACe:FAIL?`.

Note this query performs the test regardless of whether the trace or the limit is turned on the display.

Remote Command	`:CALCulate:LIMit[1]|2|…|6:FAIL?`
Example	`:CALC:LIM:FAIL?` returns a zero if limit line 1's associated trace has no failure, 1 if there is a margin or limit failure
Couplings	This query is identical to `:CALC:LLIN:FAIL?`

Limit Clear (Remote Command Only)

Clears a limit line, and all associated data. Identical to `:CALC:LLIN:DEL`

Remote Command	`:CALCulate:LIMit[1]|2|…|6:CLEar`
Example	`:CALC:LIM2:CLE` deletes all data for limit line 2
Couplings	Identical to `:CALC:LLIN:DEL`

Trace Fail (Remote Query Only)

Tests a trace against all associated limit lines. Returns 0 if the trace is within all limits and margins, 1 if the trace exceeds either the limit or the margin. If no limits apply to the selected trace, automatically returns 0.

Only applies to limits that are turned on, if a Limit is off it will not be tested. If a Trace is not displaying, it will still be tested, and if **Test Limits (All Limits)** is off the Trace will still be tested.

This command ignores limit lines that are assigned to other traces.

Remote Command	`:CALCulate:TRACe[1]|2|…|6:FAIL?`
Example	`:CALC:TRAC3:FAIL?` returns zero if there is no failure, 1 if the trace exceeds either the limit or the margin

3.2.8.3 Meas Standard

Includes controls for setting the Radio Standard for PowerSuite measurements, as well as controls for setting the EMC Standard and CISPR Preset to which the current measurement will be made.

The EMC Standard and CISPR Preset controls only appear with Option EMC or the N6141A application or the W6141A application installed and licensed.

Dependencies	Only appears if you have the proper option installed in your instrument

Radio Standard Presets

Lets you specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which is a cascading list of standards. When you have the selected the desired Standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command	`[:SENSe]:RADio:STANdard[:SELect] NONE | JSTD | IS95a | IS97D | IS98D | GSM | W3GPP | C2000MC1 | C20001X | NADC | PDC | BLUEtooth | TETRa | WL802DOT11A | WL802DOT11B | WL802DOT11G | HIPERLAN2 | DVBTLSN | DVBTGPN | DVBTIPN | FCC15 | SDMBSE | UWBINDOOR | LTEB1M4 | LTEB3M | LTEB5M | LTEB10M | LTEB15M | LTEB20M | WL11N20M | WL11N40M | WL11AC20M | WL11AC40M | WL11AC80M | WL11AC160M | WL11AX20M | WL11AX40M | WL11AX80M | WL11AX160M | WL11BE20M | WL11BE40M | WL11BE80M | WL11BE160M | WL11BE320M | WL11AD2G | WL11AY2G16 | WL11AY4G32 | WL11AY6G48 | WL11AY8G64 | NR5GFR1B100M` `[:SENSe]:RADio:STANdard[:SELect]?`

Example	`:RAD:STAN NONE` `:RAD:STAN?`
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state

The **Radio** column in the table lets you specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station (BTS) settings, for all relevant PowerSuite measurements. The Device SCPI command has the same effect as a selection in the **Radio** column:

Remote Command	`[:SENSe]:RADio:STANdard:DEVice BTS | MS` `[:SENSe]:RADio:STANdard:DEVice?`
Example	`:RAD:STAN:DEV MS` `:RAD:STAN:DEV?`
Preset	`BTS`
State Saved	Saved in instrument state
Range	`BTS|MS`

Chart for Standard and Available Measurements

Note that not every measurement in Spectrum Analyzer Mode is available for every standard. The chart below describes which measurements are available for each Radio Standard.

For TOI or Harmonics measurements, *no* Radio Standards are available.

	Swept SA	CHP	OBW	ACP	CCDF	Burst Power	Spurious Emission	SEM	List Sweep

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules
TETRA	Command Example	:RAD:STAN TETR
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
	RRC Filter	On
	RRC Filter Alpha	0.35
FCC Part15 Subpart F	Command Example	:RAD:STAN FCC15

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

DVB-T L/SECAM/NICAM	Command Example	:RAD:STAN DVBTLSN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T G/PAL/NICAM	Command Example	:RAD:STAN DVBTGPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T I/PAL/NICAM	Command Example	:RAD:STAN DVBTIPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001

S-DMB System E	Command Example	:RAD:STAN SDMBSE
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	:RAD:STAN GSM
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP W-CDMA	Command Example	:RAD:STAN W3GPP
	IBW	5 MHz
	Span	7.5 MHz
	RBW	240 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22
3GPP LTE 1.4 MHz	Command Example	:RAD:STAN LTEB1M4
	IBW	1.4 MHz
	Span	2.1 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 3 MHz	Command Example	:RAD:STAN LTEB3M
	IBW	3 MHz
	Span	4.5 MHz
	RBW	Auto rules
	VBW	Auto rules

3GPP LTE 5 MHz	Command Example	:RAD:STAN LTEB5M
	IBW	5 MHz
	Span	7.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 10 MHz	Command Example	:RAD:STAN LTEB10M
	IBW	10 MHz
	Span	15 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 15 MHz	Command Example	:RAD:STAN LTEB15M
	IBW	15 MHz
	Span	22.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 20 MHz	Command Example	:RAD:STAN LTEB20M
	IBW	20 MHz
	Span	30 MHz
	RBW	Auto rules
	VBW	Auto rules
cdma2000	Command Example	:RAD:STAN C20001X :RAD:STAN C2000MC1 :RAD:STAN? (Query always returns C20001X)
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
IS-95A	Command Example	:RAD:STAN IS95
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules

J-STD-008	Command Example	:RAD:STAN JSTD
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
NADC	Command Example	:RAD:STAN NADC
	IBW	32.8 kHz
	Span	49.2 kHz
	RBW	1.2 kHz
	VBW	Auto rules
PDC	Command Example	:RAD:STAN PDC
	IBW	21 kHz
	Span	31.5 kHz
	RBW	6.2 kHz
	VBW	Auto rules
IS-97D/98D	Command Example	:RAD:STAN IS97D :RAD:STAN IS98D :RAD:STAN IS95C :RAD:STAN? Query always returns `IS97D`
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24kHz
	VBW	Auto rules

Band Class (IS-97D/98D only)

The following function is only available when you have selected the standard: IS-97D/98D. It lets you select the band class.

Remote Command	`[:SENSe]:RADio:STANdard:BAND:CLASs BC0 | BC1` `[:SENSe]:RADio:STANdard:BAND:CLASs?`
Example	`:RAD:STAN:BAND:CLAS BC0` `:RAD:STAN:BAND:CLAS?`
Preset	`BC0`
State Saved	Saved in instrument state
Range	0 (800 MHz Band)|1 (1900 MHz Band)

Wireless Radio Standards

The table below lists the CHP settings and provides an example for each wireless Radio Standard.

WLAN 802.11a	Command Example	:RAD:STAN WL802DOT11A
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11g	Command Example	:RAD:STAN WL802DOT11G
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11b	Command Example	:RAD:STAN WL802DOT11B
	IBW	25 MHz
	Span	37.5 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11n 20 MHz	Command Example	:RAD:STAN WL11N20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11n 40 MHz	Command Example	:RAD:STAN WL11N40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 20 MHz	Command Example	:RAD:STAN WL11AC20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules

WLAN 802.11ac 40 MHz	Command Example	:RAD:STAN WL11AC40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 80 MHz	Command Example	:RAD:STAN WL11AC80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 160 MHz	Command Example	:RAD:STAN WL11AC160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 20 MHz	Command Example	:RAD:STAN WL11AX20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 40 MHz	Command Example	:RAD:STAN WL11AX40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 80 MHz	Command Example	:RAD:STAN WL11AX80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 160 MHz	Command Example	:RAD:STAN WL11AX160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules

WLAN 802.11be 20 MHz	Command Example	:RAD:STAN WL11BE20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 40 MHz	Command Example	:RAD:STAN WL11BE40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 80 MHz	Command Example	:RAD:STAN WL11BE80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 160 MHz	Command Example	:RAD:STAN WL11BE160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 320 MHz	Command Example	:RAD:STAN WL11BE320M
	IBW	320 MHz
	Span	480 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ad 2 GHz	Command Example	:RAD:STAN WL11AD2G
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 2.16 GHz	Command Example	:RAD:STAN WL11AY2G16
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules

WLAN 802.11ay 4.32 GHz	Command Example	:RAD:STAN WL11AY4G32
	IBW	4.32 GHz
	Span	6.48 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 6.48 GHz	Command Example	:RAD:STAN WL11AY6G48
	IBW	6.48 GHz
	Span	9.72 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 8.64 GHz	Command Example	:RAD:STAN WL11AY8G64
	IBW	8.64 GHz
	Span	12.96 GHz
	RBW	1 MHz
	VBW	Auto rules
3GPP 5G NR 5G NR FR1 100MHz	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules

WLAN HiperLAN/2	Command Example	:RAD:STAN HIPERLAN2
	UWB Indoor	Command Example RAD:STAN UWBINDOOR
	Bluetooth	Command Example RAD:STAN BLUE

Packet Type (Bluetooth only)

The command below sets the packet type for the Bluetooth measurement

Remote Command	[:SENSe]:RADio:STANdard:PACKet DH1 | DH3 | DH5 [:SENSe]:RADio:STANdard:PACKet?
Example	:RAD:STAN:PACK DH1 :RAD:STAN:PACK?
Notes	The packet length is: DH1 366 µs

	DH3	1622 µs
	DH5	2870 µs
Preset	DH1	
State Saved	Saved in instrument state	
Range	DH1 | DH3 | DH5

		HiperLAN/2	
	Bluetooth	DH1	
		DH3	
		DH5	
	UWB Indoor		

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is NONE, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = [Offset Freq A] - 0.5*([Chan Integ BW] + [Ref BW])
2. Divide by 4.5. Call the result GuardbandGoalRBW

3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute AutoRBWGoal = min(IntegBWGoal, max(GuardbandGoalRBW, ChannelWidthGoalRBW))
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as `:CONF` allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to `NONE`.

Enable Non-Std Meas

Lets you specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to `NO`, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to `YES`, all measurements and standard selections are enabled, so you can select any combination.

NOTE **If you select an unavailable measurement or unavailable radio standard using the Enable Non-Std Meas control, the measurement results may not conform to the selected standard.**

Remote Command	`[:SENSe]:RADio:STANdard:EAMeas YES | NO` `[:SENSe]:RADio:STANdard:EAMeas?`
Example	`:RAD:STAN:EAM YES` `:RAD:STAN:EAM?`
Preset	`NO`
State Saved	Saved in instrument state
Range	`YES|NO`

EMC Standard

Lets you select NONE (no EMI standard), CISPr (CISPR 16-1-1), or MIL (MIL-461A). Each standard has a unique way of determining the couplings between detectors and RBWs, as well as its own set of available RBWs.

Note that "Auto Couple" on page 1995 has no effect on the EMC Standard setting.

Remote Command	`[:SENSe]:EMC:STANdard[:SELect] NONE | CISPr | MIL` `[:SENSe]:EMC:STANdard[:SELect]?`
Example	`:EMC:STAN CISP`
Dependencies	When the **EMC Standard** changes to **CISPR** or **MIL**, the **RBW Filter Type** and **RBW BW** controls are grayed-out. The **Filter Type** is then always Gaussian; the **Filter BW** is chosen as appropriate for the filter and the standard. See the **BW** key description When the EMC Standard changes to **None**, the **Filter Type** is set to Gaussian and the Filter BW is set to -3 dB Only appears with Option EMC installed and licensed. If not, the command generates a message
Couplings	The auto rules for detector select Peak for any trace in Auto when the EMI Standard is CISPR or MIL Choosing a CISPR detector or CISPR presets automatically picks the CISPR Standard, however switching from a CISPR detector has no impact on EMC Standard
State Saved	Saved in instrument state

Backwards Compatibility Command

Notes	This command is mapped to `:EMC:STANdard` with the following mappings: EMI=>CISPr, SAN =>None, and if the legacy command comes in with the OFF parameter, it sets EMC Standard to None and Res BW to Manual . The query returns "OFF" if Res BW in Manual, otherwise "EMI" if EMC Standard is CISPR or MIL, and "SAN" if EMC Standard is None
Dependencies	Only appears in N/W6141A applications or with Option EMC installed and licensed. If not, the command generates a message
Preset	`SAN`
Backwards Compatibility SCPI	`[:SENSe]:BANDwidth|BWIDth[:RESolution]:MODE EMI | SAN | OFF` `[:SENSe]:BANDwidth|BWIDth[:RESolution]:MODE?`

CISPR Presets

This group of controls lets you easily set up the instrument for CISPR measurements.

This topic contains the following sections:

- "Controls in the CISPR Group" on page 424
- "Band Setup" on page 424
- "Sweep Points in Band E" on page 425

Remote Command	`[:SENSe]:FREQuency:CISPr:BAND A | B | C | CD | D | E`
Example	`:FREQ:CISPR:BAND A` activates the CISPR preset for Band A
Couplings	Selecting a CISPR preset sets the EMI Standard to CISPR, performs an autocouple all, and sets the Y Axis Unit to dBµV (unless dBuV is grayed-out, in which case it will leave the Y Axis Unit unaffected)

Controls in the CISPR Group

This group contains controls to set the following Presets:

- CISPR A 9 kHz – 150 kHz
- CISPR B 150 kHz – 30 MHz
- CISPR C 30 MHz – 300 MHz
- CISPR C/D 30 MHz – 1 GHz
- CISPR D 300 MHz – 1 GHz
- CISPR E 1 GHz – 18 GHz

Band Setup

The number of sweep points for each band is roughly calculated by the formula 2*(Stop Frequency-Start Frequency)/RBW, so that you get two points for every RBW width. This number is increased as necessary to make it an odd integer, so that you always end up with an odd number of sweep points. This is desirable so that you always have a sweep point at the Center Freq.

Band Setup	Band A	Band B	Band C	Band D	Band C&D	Band E
Start Frequency	9 kHz	150 kHz	30 MHz	300 MHz	30 MHz	1 GHz
Stop Frequency	150 kHz	30 MHz	300 MHz	1 GHz	1 GHz	Max freq of instrument or 18 GHz, whichever is lower
Sweep Points	1411	6635	4501	11667	16167	See below

The table above is based on the fact that the Res BW autocouples to the center frequency when in the CISPR EMC standard as follows:

Center Frequency	RBW
<150 kHz	200 Hz
150 kHz to 30 MHz	9 kHz
>30 MHz to 1 GHz	120 kHz
>1 GHz	1 MHz

Sweep Points in Band E

Note that the Res BW is 1 MHz in band E. The number of sweep points for band E is dependent on the maximum frequency of the instrument. The formula above gives the following values for Band E:

Option	Max Instrument Freq (nominal)	Width of Band E	Number of Points
503 (3.0 GHz models)	3.0 GHz	2.0 GHz	4001
503 (3.6 GHz models	3.6 GHz	2.6 GHz	5201
507 (7 GHz models)	7.0 GHz	6.0 GHz	12001
507 (7.5 GHz models)	7.5 GHz	6.5 GHz	13001
508	8.4 GHz	7.4 GHz	14801
513	13.2 GHz	12.2 GHz	24401
526	26.5 GHz	17 GHz	34001
544 (and above)	44 GHz	43 GHz	40001 (max)

3.2.8.4 Legacy Compat (Compatibility)

Contains controls for setting the Legacy Compatibility functions, which let you modify certain behaviors to exactly match our legacy products.

Certain behaviors in the X-Series instruments were changed from legacy HP/Agilent analyzers, in order to give you access to new, more powerful functionality. Keysight recognizes that from time to time, it is necessary to *exactly* match legacy behaviors, which is what the controls on this tab accomplish.

Average/Hold

In X-Series instruments, Max Hold and Min Hold traces were added to the trace types that were controlled by the Average Number (which became the Average/Hold Number). In other words, setting an Average/Hold number of 100 and then performing a Max Hold in Single sweep takes 100 traces and then stops, and pressing Restart restarts the Max Hold Sequence. This allows the user to exactly control how the number of Max Hold traces taken; however, many users need a way of stopping and then resuming a Max/Min Hold without clearing the accumulated result.

In the past you could stop and start Max Hold by going back and forth between **Single** and **Continuous**. Currently, neither X-Series nor legacy instruments like ESA and PSA clear the Max or Min Hold when going from **Cont** to **Single** and *vice versa*; so, you can go to **Single** to stop temporarily and then resume the Max or Min Hold by going back to **Cont**. However, in X-Series, because Max and Min Hold obey the **Average/Hold Number**, this is not an effective method for stopping a sweep, until you have reached the terminal count. Also, **Restart** is sometimes used as part of this method and in the X-Series, **Restart** clears the accumulated Max/Min Hold, whereas in the PSA (for example) it does not.

The **Average/Hold** switch in the **Legacy Compatibility** menu solves this problem. When this switch is **On**, the following is true for traces in Max Hold or Min Hold:

– They pay no attention to the Average/Hold number; “Single” for Max Hold and Min Hold causes one sweep only, so going to **Single** stops after the current sweep, and going to **Cont** starts you going again without clearing the accumulated result

– They do not clear the Max or Min Hold on **Restart** or **Single**, or `:INIT:IMM` (changing a measurement parameter like frequency or bandwidth, etc. would still restart the max/min hold)

Note that whenever any trace is in Average, the **Single/Cont** controls *do* tie in to the **Avg/Hold Number**, and pressing **Single***does* cause a set of sweeps (100 by default). This is also true in PSA.

Remote Command	`:CONTrol:COMPatible:TRACe ON | OFF | 1 | 0` `:CONTrol:COMPatible:TRACe?`
Example	`:CONT:COMP:TRAC ON` `ON` means exhibit legacy average/hold behavior
Preset	Unaffected by **Mode Preset**. Set to `OFF` by **Restore Mode Defaults**
State Saved	Saved in State

Detector

In the HP/Agilent ESA Spectrum Analyzer, the default detector is **Peak**. In later instruments, **Normal** (which does alternate peak and pit detection) is the default, but ESA did not have this detector. For ESA compatibility, the **Detector** switch in the **Legacy Compatibility** menu causes the Detector Auto Rules to select the **Peak** detector instead of the **Normal** detector for the conditions under which the **Normal** detector would otherwise be chosen.

This means that when you have this switch on, performing **Mode Preset** causes the **Peak** detector to be chosen, rather than the **Normal** detector, just like ESA.

Remote Command	`:CONTrol:COMPatible:DETector ON | OFF | 1 | 0` `:CONTrol:COMPatible:DETector?`
Example	`:CONT:COMP:DET ON` `ON` means exhibit ESA detector behavior
Preset	Unaffected by **Mode Preset**. Set to `OFF` by **Restore Mode Defaults**
State Saved	Saved in State

*RST

In older HP/Agilent/Keysight Spectrum Analyzers, sending `*RST` (to preset the analyzer) puts the analyzer in **Continuous** sweep mode. To be compliant with the IEEE-488.2 specification, X-Series instruments put the instrument into **Single** sweep mode on `*RST`.

For backwards compatibility, when the `*RST` switch in the **Legacy Compatibility** menu is `ON`, the `*RST` command puts the instrument into **Continuous** sweep mode.

Remote Command	`:CONTrol:COMPatible:RST ON | OFF | 1 | 0` `:CONTrol:COMPatible:RST?`
Example	`:CONT:COMP:RST ON` `ON` means exhibit pre-X-series `*RST` behavior
Preset	Unaffected by **Mode Preset**. Set to `OFF` by **Restore Mode Defaults**
State Saved	Saved in State

3.2.8.5 Tune & Listen

Contains controls to turn the demod function on and off and select modulation type and configure the demod bandwidth. This tab only appears if N9063C Analog Demod Mode, N6141C Mode, or Option EMC is installed and licensed.

Does not appear in instruments that do not contain a speaker, such as VXT, EXM, UXM and CXA-m.

When the function is `ON` (set to AM, FM, or ΦM), the demodulated signal is fed to the instrument's speaker. Muting and volume control functions are done through the standard Windows speaker volume control interface.

Demod Type

Sets the type of Demod to be performed for the Tune & Listen function.

Remote Command	`[:SENSe]:DEMod AM | FM | PM | OFF` `[:SENSe]:DEMod?`
Example	`:DEM AM` turns amplitude demodulation function ON
Dependencies	When **Tune & Listen** is ON, all active traces are forced to use the same detector CISPR detectors (QPD, EMI Avg, RMS Avg) and Tune & Listen are mutually exclusive. No sound output is heard if one of these detectors is selected
Preset	OFF
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`[:SENSe]:DEMod:STATe ON | 1 | OFF | 0` `[:SENSe]:DEMod:STATe?`
Backwards Compatibility Notes	Sending `DEM:STAT ON` has the same effect as sending `DEM:AM,` turning AM Demod ON Sending `DEM:STAT OFF` has the same effect as sending `DEM:OFF,` turning Demod OFF The query returns the state of the Analog Demod Tune and Listen function. The response to the query is determined by the current setting of `[:SENSE]:DEMod AM|FM|PM|OFF`. The response is 1 if `AM, FM, PM` are selected, or 0 if `OFF` is selected. In ESA, the command [:SENSe]:`DEMod AM|FM` would select the demodulation type but would not activate it (turn it on). In X-Series this command both selects and activates demodulation The X-Series implementation of Demod Tune and Listen does not include Squelch Control as was supported in ESA The speaker control for Tune and Listen for X-Series is done with the volume up/down and mute hardkeys in the System Settings dialog and is handled by the Windows operating system. There is no software speaker on/off control as was supported in ESA

Demod Time

Sets the amount of time the instrument demodulates the signal after each sweep for the Tune & Listen function. The demodulated signal can be heard through the speaker during demodulation. In zero span, demodulation can be performed continuously, making this parameter not applicable, hence it is grayed-out in zero span.

Remote Command	`[:SENSe]:DEMod:TIME <time>` `[:SENSe]:DEMod:TIME?`
Example	`:DEM:TIME 500 ms` `:DEM:TIME?`
Notes	Grayed-out in **Zero Span**
Dependencies	Unavailable in **Zero Span**
Preset	500 ms
State Saved	Saved in instrument state

Min	2 ms
Max	100 s

AM Channel BW

Sets the RBW setting used by the hardware during the demodulation period in nonzero spans for the Tune & Listen function. Note that this is a separate parameter only for the demodulation function and does not affect the RBW setting in the BW menu which is used during the normal sweep. The flat top filter type must be used during the demodulation period. A 5 kHz Video Bandwidth filter is used.

In Zero Span, the instrument's RBW & VBW filters are used for the demodulation; thus, the Channel BW (and RBW filter type) will match those of the instrument. This allows gap-free listening. The Channel BW control is grayed-out and the value displayed on the control matches the current RBW of the instrument. Upon leaving zero span, the non-zero-span setting of Channel BW is restored as well as the flattop filter type.

Remote Command	`[:SENSe]:DEMod:AM:BANDwidth:CHANnel <freq>` `[:SENSe]:DEMod:AM:BANDwidth:CHANnel?`
Example	`:DEM:AM:BAND:CHAN 200 kHz`
Notes	Grayed-out in **Zero Span**
Dependencies	Unavailable in **Zero Span**
Couplings	In **Zero Span** only, the value is set equal to the instrument's current RBW value and it displays that value on the control, but the control is grayed-out
Preset	30 kHz
State Saved	Saved in instrument state
Min	390 Hz
Max	8 MHz

FM Channel BW

Sets the **Res BW** setting used by the hardware during the demodulation period in nonzero spans for the **Tune & Listen** function. Note that this is a separate parameter only for the demodulation function and does not affect the RBW setting in the BW menu which is used during the normal sweep. The flat top filter type must be used during the demodulation period. A 5 kHz Video Bandwidth filter is used.

In **Zero Span**, the instrument's RBW & VBW filters are used for the demodulation; thus, the Channel BW (and RBW filter type) will match those of the instrument. This allows gap-free listening. The Channel BW control is grayed-out and the value displayed on the control matches the current RBW of the instrument. Upon leaving zero span, the previous setting of Channel BW and the flattop filter type are restored.

Remote Command	`[:SENSe]:DEMod:FM:BANDwidth:CHANnel <freq>` `[:SENSe]:DEMod:FM:BANDwidth:CHANnel?`
Example	`:DEM:FM:BAND:CHAN 200 MHz`
Notes	Grayed-out in **Zero Span**
Dependencies	Unavailable in **Zero Span**
Couplings	In **Zero Span** only, the value is set equal to the instrument's current RBW value and it displays that value on the control, but the control is grayed-out
Preset	150 kHz
State Saved	Saved in instrument state
Min	390 Hz
Max	8 MHz

PM Channel BW

Sets the RBW setting used by the hardware during the demodulation period in nonzero spans for the Tune & Listen function. Note that this is a separate parameter only for the demodulation function and does not affect the RBW setting in the BW menu which is used during the normal sweep. The flat top filter type must be used during the demodulation period. A 5 kHz Video Bandwidth filter is used.

In **Zero Span**, the instrument's RBW & VBW filters are used for the demodulation; thus, the Channel BW (and RBW filter type) will match those of the instrument. This allows gap-free listening. The Channel BW control is grayed-out and the value displayed on the control matches the current RBW of the instrument. Upon leaving zero span, the previous setting of Channel BW and the flattop filter type are restored.

Remote Command	`[:SENSe]:DEMod:PM:BANDwidth:CHANnel <freq>` `[:SENSe]:DEMod:PM:BANDwidth:CHANnel?`
Example	`:DEM:PM:BAND:CHAN 200 MHz`
Notes	Grayed-out in **Zero Span**
Dependencies	Unavailable in **Zero Span**
Couplings	In **Zero Span** only, the value is set equal to the instrument's current RBW value and it displays that value on the control, but the control is grayed-out
Preset	100 kHz
State Saved	Saved in instrument state
Min	390 Hz
Max	8 MHz

FM Demod De-emphasis

Controls a single-pole filter (6 dB/octave roll off) for the **Tune & Listen** function, usually to counter intentional pre-emphasis in the transmitter. When De-emphasis state is `OFF`, the hardware digital filter is bypassed, otherwise the setting is applied.

The choices are Off, 25 µs, 50 µs, 75 µs, and 750 µs.

Only available when FM is the demod selected. Grayed-out for AM and PM.

Remote Command	`[:SENSe]:DEMod:FM:DEEMphasis OFF | US25 | US50 | US75 | US750` `[:SENSe]:DEMod:FM:DEEMphasis?`
Example	`:DEM:FM:DEEM US75` Sets the de-emphasis for FM demod to 75 µs
Dependencies	Only available in FM. Grayed-out for AM and PM
Preset	`US75` recommended for US commercial FM 75 µs pre-emphasis
State Saved	Saved in instrument state

3.2.8.6 Advanced

Contains controls for setting advanced functions of the instrument.

Does not appear in instruments that do not contain **Advanced** functions. Most of the modular instruments (including VXT models M9410A/11A) fall into this category, as does UXM.

Phase Noise Optimization

Selects the LO (local oscillator) phase noise behavior for various desired operating conditions.

For full details, see "Parameter Options, Installed Options, Auto Rules & Ranges" on page 432 below.

Remote Command	`[:SENSe]:FREQuency:SYNThesis[:STATe] 1 | … | 5` `[:SENSe]:FREQuency:SYNThesis[:STATe]?`
Example	`:FREQ:SYNT 2` selects optimization for best wide offset phase noise
Dependencies	Does not appear in all models. The control is not displayed in those models, but the command is accepted for compatibility (although no action is taken)
Preset	Because this function is in Auto after preset, and because **Span** after preset > 314.16 kHz (see Auto

	rules, next section) the state of this function after Preset will be 2
Range	See "Ranges" on page 436 below
Annotation	Found in the Meas Bar under **PNO** When not in Auto, label changes to **#PNO**

Auto Function

Remote Command	`[:SENSe]:FREQuency:SYNThesis:AUTO[:STATe] OFF | ON | 0 | 1` `[:SENSe]:FREQuency:SYNThesis:AUTO[:STATe]?`
Example	`:FREQ:SYNT:AUTO ON`
Preset	`ON`

Parameter Options, Installed Options, Auto Rules & Ranges

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 433	1	– In instruments with EP0, balances close-in phase noise with spur avoidance – In instruments without EP0 optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 434	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 434	3	Optimizes LO for tuning speed
"Best Close-in" on page 433	4 or 1*	– In instruments with EP0, emphasizes close-in phase noise performance without regard to spur avoidance – In instruments without EP0, this setting is accepted but no action is taken
"Best Spurs" on page 433	5	– In instruments with EP0, emphasizes spur avoidance over close-in phase noise performance – In instruments without EP0, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EP0 installation. See "Best Close-in" on page 433 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 434 is identical in effect to "Best Close-in" on page 433.

Best Close-in

Without option EP0

`:FREQ:SYNT 1`

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EP0

`:FREQ:SYNT 4`

In instruments with Option EP0, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 433 setting, parameter 1 selects "Balanced" on page 433 in EP0 instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 433, which is usually not as good a choice as "Balanced" on page 433.

Balanced

`:FREQ:SYNT 1`

In instruments with EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EP0, the LO is configured for better phase noise than the "Best Wide-offset" on page 434 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 433 case mostly within ±1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 433 case at better than –90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "Fast Tuning" on page 434 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "Best Spurs" on page 433. It is available with the "Fast Tuning" on page 434 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "Fast Tuning" on page 434 option, the settings for "Best Close-in" on page 433 are used if "Fast Tuning" on page 434 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EP0 Models with option EP0 have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz	"Balanced" on page 433
	Span > 114.1 MHz, *or* RBW > 800 kHz	"Fast Tuning" on page 434
	RBW > 290 kHz, *or* Span > 4.2 MHz	"Best Wide-offset" on page 434
	Other conditions	"Balanced" on page 433
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, *or* RBW > 1.9 MHz, *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 434
	Center frequency is < 195 kHz, *or* CF >= 1 MHz *and* Span <= 1.3 MHz *and* RBW <= 75 kHz	"Best Close-in" on page 433
	All other conditions	"Best Wide-offset" on page 434
EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 433; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	CF < 130 kHz , *or* CF > 12 MHz *and* Span < 495 kHz *and* RBW < 40 kHz	"Best Close-in" on page 433
	Span > 22 MHz, *or* RBW > 400 kHz, *or* CF ≤ 12 MHz *and* Span < 495 kHz *and* RBW < 23 kHz	"Fast Tuning" on page 434
	All other conditions	"Best Wide-offset" on page 434
EP4 (available in CXA for improved phase noise)	Span > 101 MHz *or* RBW > 1.15 MHz *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 434
	CF is < 109 kHz *or* CF >= 4.95 MHz *and* Span <= 666 kHz *and* RBW < 28 kHz	"Best Close-in" on page 433

Models with Option	Conditions	Selection
	All other conditions	"Best Wide-offset" on page 434
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 434 are actually the same as "Best Close-in" on page 433, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, *or* RBW > 250 kHz, *or* Source Mode is set to "Tracking"	"Fast Tuning" on page 434
	Center frequency is < 25 kHz, *or* CF >= 1 MHz *and* Span <= 141.4 kHz *and* RBW <= 5 kHz	"Best Close-in" on page 433
	All other conditions	"Best Wide-offset" on page 434

In all the above cases:

– The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter

– The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP1	1	Best Close-in	[offset < 140 kHz]
	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]

Option	Option #	Phase Noise Option	Range
EP2, EP3, EP5	1	Best Close-in	[offset < 70 kHz]
	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
EP4	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

ADC Dither

Controls the **ADC Dither** function, which enhances linearity for low level signals at the expense of reduced clipping-to-noise ratio. The reduced clipping-to-noise ratio results in higher noise, because we work to ensure that the clipping level of the ADC relative to the front terminals remains unchanged with the introduction of dither, and this results in reduced ADC dynamic range. So, making measurements with ADC dither gives you better amplitude linearity, but turning ADC dither off gives you a lower noise floor (better sensitivity).

With dither on, the third-order distortions are usually invisible for mixer levels below –35 dBm. With dither off, these distortions can be visible, with typical power levels of –110 dBm referred to the mixer. Detection nonlinearity can reach 1 dB for dither off at mixer levels around –70 dBm and lower, while the specified nonlinearity is many times smaller with dither on.

When **ADC Dither** is on, the linearity of low-level signals is improved. The enhanced linearity is mostly improved scale fidelity. The linearity improvements of dither are most significant for RBWs of 3.9 kHz and less in swept mode, and FFT widths of 4 kHz and less in FFT mode.

The increased noise due to turning dither on is most significant in low band (0 to 3.6 GHz) with **IF Gain** set to Low, where it can be about 0.2 dB.

Remote Command	`[:SENSe]:ADC:DITHer[:STATe] OFF | ON | HIGH`
	For options, see "Option Details" on page 438
	`[:SENSe]:ADC:DITHer[:STATe]?`

Example	`:ADC:DITH HIGH`
	`:ADC:DITH ON`
	Specifying option `ON` sets Medium dither. In older instruments, the **Medium** key was labeled **On**, and the SCPI for this setting has *not* changed

Dependencies	In some models, the `HIGH` parameter is not available. In some instruments, the `HIGH` parameter is accepted, and the `HIGH` state is set and returned to a query, but the Medium (`ON`) dither level is actually used
Preset	AUTO

Range	OFF|ON|HIGH
Backwards Compatibility SCPI	[:SENSe]:ADC:DITHer AUTO
Backwards Compatibility Notes	The command: [:SENSe]:ADC:DITHer AUTO is aliased to: [:SENSe]:ADC:DITHer:AUTO[:STATe] ON Because of this, the [:SENSe]:ADC:DITHer function cannot be a true Boolean, so the query, [:SENSe]:ADC:DITHer? returns OFF or ON (not 1 or 0 like a true Boolean)

Auto Function

Remote Command	[:SENSe]:ADC:DITHer:AUTO[:STATe] OFF | ON | 0 | 1 [:SENSe]:ADC:DITHer:AUTO[:STATe]?
Example	:ADC:DITH:AUTO ON
Preset	ON

Option Details

Detail on the settings follows:

Auto

Sets the ADC dither to automatic. The instrument then chooses the dither level according to which is most likely to be the best selection, based on other settings within the digital IF.

When in Auto, the instrument sets the dither to Medium whenever the effective IF Gain is Low by this definition of IF Gain = Low:

- When Sweep Type = Swept, IF Gain = Low whenever Swept IF Gain is set to Low Gain, whether by autocoupling or manual selection
- When Sweep Type = FFT, IF Gain = Low whenever FFT IF Gain is set to "Low Gain," which cannot happen by autocoupling

Whenever the IF Gain is not Low by this definition, Auto sets the dither to Off.

Example	:ADC:DITH:AUTO ON

High (Best Log Accy)

When ADC Dither is set to High, the scale fidelity is especially good, most notably the relative scale fidelity. The tradeoff is that there is a modest loss of noise floor performance, up to about a decibel.

Example	`:ADC:DITH:HIGH`

Medium (Log Accy)

The Medium setting of ADC Dither (known as “On” in earlier versions of the instrument software) improves the linearity of low-level signals at the expense of some noise degradation.

Example	`:ADC:DITH:ON`

Off (Best Noise)

When ADC Dither is Off, the instrument noise floor is improved, because without the need to make room for the dither, you get a lower noise floor and better sensitivity.

Example	`:ADC:DITH:OFF`

Swept IF Gain

To take full advantage of the RF dynamic range of the instrument, there is an added switched IF amplifier with approximately 10 dB of gain. When you can turn it on without overloading the instrument, the dynamic range is always better with it on than off. The **Swept IF Gain** control can be used to set **IF Gain** to Auto, to **High** Gain (the extra 10 dB), or to **Low** Gain. These settings affect sensitivity and IF overloads.

This function is only active when in Swept sweeps. In FFT sweeps, the FFT IF Gain function is used instead.

Option	SCPI	Details
Auto	AUTO = ON	"Auto" on page 440
Low	OFF	"Low Gain (Best for Large Signals)" on page 440
High	ON	"High Gain (Best Noise Level)" on page 440

Remote Command	`[:SENSe]:IF:GAIN:SWEPt[:STATe] OFF | ON | 0 | 1` `[:SENSe]:IF:GAIN:SWEPt[:STATe]?`
Example	`:IF:GAIN:SWEP ON`
Dependencies	The IF Gain keys (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no keys grayed-out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the keys
Couplings	The ‘auto’ rules for Swept IF Gain depend on attenuation, preamp state, start and stop frequency and the setting of FFT IF Gain. Set the Swept IF Gain to High (On) when the total input attenuation is 0 dB, the preamp is off, the start frequency is 10 MHz or more, and the FFT IF Gain is autocoupled, or manually set to Autorange, or manually set to High. Also set the Swept IF Gain to High (On) when the

	total input attenuation is 2 dB or less, the preamp is on, the start frequency is 10 MHz or more, and the stop frequency is 3.6 GHz or less and the FFT IF Gain is autocoupled, or manually set to Autorange, or manually set to High. Under all other circumstances, set the Swept IF Gain to Low (Off) If the sweep type is Swept, the start frequency of the instrument is less than 10 MHz, and you put Swept IF Gain in Manual On, a warning condition is generated and remains in effect as long as this condition exists. The warning message is about a possible IF overload As with most parameters with an AUTO state, "Auto Couple" on page 1995 sets it to Auto, and setting any specific value (for example on or off) will set the AUTO state to false
Preset	Auto after a Preset, which yields Off unless the Preamp is on Auto and Off after Meas Preset
State Saved	Saved in instrument state
Range	Low Gain | High Gain
Annunciation	Low | High Found in the Meas Bar under **IF Gain** when in Swept sweep type When not in Auto, label changes to **#IF Gain**

Auto Function

Remote Command	`[:SENSe]:IF:GAIN:SWEPt:AUTO[:STATe] OFF | ON | 0 | 1` `[:SENSe]:IF:GAIN:SWEPt:AUTO[:STATe]?`
Example	`:IF:GAIN:SWEP:AUTO ON`
Preset	`ON`

Auto

Activates the auto rules for Swept IF Gain.

Low Gain (Best for Large Signals)

Forces Swept IF Gain to be off.

Example	`:IF:GAIN:SWEP OFF`

High Gain (Best Noise Level)

Example	`:IF:GAIN:SWEP ON`
Dependencies	The High setting for **Swept IF Gain** is grayed-out when **FFT IF Gain** is manually set to Low (not when Low is chosen by the auto-rules)

FFT IF Gain

Accesses the keys to set the ranging in the digital IF when doing FFT sweeps. When in Autorange mode, the IF checks its range once for every FFT chunk, to provide the best signal to noise ratio. You can specify the range for the best FFT speed, and optimize for noise or for large signals.

When the sweep type is FFT and this function is in **Autorange**, the IF Gain is set `ON` initially for each chunk of data. The data is then acquired. If the IF overloads, then the IF Gain is set `OFF` and the data is re-acquired. Because of this operation, the Auto setting uses more measurement time as the instrument checks/resets its range. You can get faster measurement speed by forcing the range to either the high or low gain setting. But you must know that your measurement conditions will not overload the IF (in the high gain range) and that your signals are well above the noise floor (for the low gain range), and that the signals are not changing.

Option	SCPI	Details
Auto	AUTO = ON	"Auto" on page 442
Autorange	`AUTOrange`	"Autorange (Slower: Follows Signals)" on page 442
Low	`LOW`	"Low Gain (Best for Large Signals)" on page 442
High	`HIGH`	"High Gain (Best Noise Level)" on page 442

Remote Command	`[:SENSe]:IF:GAIN:FFT[:STATe] AUTOrange | LOW | HIGH` `[:SENSe]:IF:GAIN:FFT[:STATe]?`
Example	`:IF:GAIN:FFT ON`
Dependencies	The IF Gain keys (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no keys grayed-out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the keys
Couplings	As with most parameters with an `AUTO` state, "Auto Couple" on page 1995 sets it to Auto, which then picks `AUTOrange`, and setting any specific value (`AUTOrange`, `LOW` or `HIGH`) will set the `AUTO` state to false
Preset	`AUTOrange`
State Saved	Saved in instrument state
Range	`AUTOrange|LOW|HIGH`
Annunciation	Autorange | Low | High Found in the Meas Bar under **IF Gain** when in FFT sweep type When not in Auto, label changes to **#IF Gain**
Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:LOG:RANGe:AUTO` `[:SENSe]:ADC:RANGe AUTO | NONE`
Backwards Compatibility Notes	The first form is included for ESA compatibility The second form is included for PSA compatibility. The command and query are accepted without error but ignored

Auto Function

Remote Command	`[:SENSe]:IF:GAIN:FFT:AUTO[:STATe] OFF | ON | 0 | 1` `[:SENSe]:IF:GAIN:FFT:AUTO[:STATe]?`

Example	`:IF:GAIN:FFT:AUTO ON`
Preset	`ON`

Auto

Allows the instrument to pick the FFT IF Gain method as appropriate. When in Auto, the FFT IF Gain is set as follows:

- When the Sweep Type Rules are set to “Best Speed,” the instrument selects `LOW` Gain as the auto choice
- When the Sweep Type Rules are set to “Best Dynamic Range”, the instrument selects `AUTOrange` as the auto choice

Auto is selected when "Auto Couple" on page 1995 is pressed.

Autorange (Slower: Follows Signals)

Turns the ADC ranging to automatic, which provides the best signal to noise ratio. `AUTOrange` is usually preferred over the manual range choices.

NOTE: In N9041B, when the **Software Preselection** switch in the **Amplitude**, **Signal Path** menu is `ON`, and RF Input 2 is selected, **Autorange** always selects high gain. This provides the best signal-to-noise ratio, at the risk of overloading in the presence of stronger signals. If you experience overloads with **Software Preselection** set to `ON`, set **FFT IF Gain** to **Low** manually.

Example	`:IF:GAIN:FFT AUTOrange`

Low Gain (Best for Large Signals)

Forces FFT IF Gain to be `LOW`.

Example	`:IF:GAIN:FFT LOW`

High Gain (Best Noise Level)

Forces FFT IF Gain to be `HIGH`.

Example	`:IF:GAIN:FFT HIGH`

Noise Floor Extension

Lets you configure Noise Floor Extension (NFE). All Modes that support NFE let you set it on or off. Additionally, some Modes support *two* “on” states for NFE, Full and Adaptive, as described below.

Adaptive Option Support

At present (Release: X-Apps 2024), support for **Adaptive** NFE is as follows:

Mode	Measurements	Supports Adaptive NFE?
BT	ACP, IBEM, IBSP	No
CQM	MON	Yes
EDGEGSM	EORF, ETSP, MON	No
EMI	APD, DAN, FSC, MON, RTSC, SCH	Yes
LTEAFDD	PVT	No
LTEATDD	PVT	No
MSR	ACP, CHP, MON, OBW, SEM, SPUR	Yes
NR5G	PVT	No
PNOISE	LPL, MON, SFR	No
SA	SAN	Yes
SRCOMMS	ACP, CHP, MON, OBW, SEM, SPUR	Yes
VMA	ACP, CHP, OBW, SEM, SPUR	Yes
WCDMA	ACP, CHP, MON, OBW, SEM, SPUR	Yes
WLAN	CHP, MON, OBW, SEM, SPUR	Yes

The menus and command options are as follows:

NFE State	Modes with Adaptive NFE	Modes without Adaptive NFE	SCPI
Off	**Off**	**Off**	See "NFE On/Off Command" on page 445
On	**Full**	**On**	
Adaptive	**Adaptive**	n/a	See "Adaptive NFE Command" on page 445

As shown in the table above, the **On** state (in Modes that do not support **Adaptive** NFE) matches the **Full** state in Modes that *do* support **Adaptive** NFE.

To maintain SCPI backwards compatibility, the existing command to turn NFE on or off is retained, and a new command is added to set the state to turn **Adaptive**`ON` or `OFF`:

- `[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, with the default changed to `ON` for Modes that support **Adaptive** NFE
- `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default = `ON`

When NFE is **On** or **Full**, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

NFE works with any RBW, VBW, detector, any setting of **Average Type**, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to **Average** or **Peak**). It works best with extreme amounts of smoothing, and with the average detector, with the **Average Type** set to **Power**.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the **Average** detector, results are better with long sweep times and fewer trace averages. When using the **Sample** detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE **Noise Floor Extension has no effect unless the RF Input is selected, so when External Mixing is selected, it does nothing.**

For more details, see "Optimal Detector & Averaging Selections" on page 446 and "Recalibration of Noise Floor" on page 447.

Pros & Cons of Adaptive NFE

Adaptive NFE provides an alternative to fully-on or fully-off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the fully-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

In **Adaptive** NFE, there is not the same dramatic visual impact on the noise floor as there is in **Full** NFE. **Adaptive** NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the fully-off case; and when lots of averaging is being performed, the signal displays more like the **Full** NFE case.

Adaptive NFE is recommended for general-purpose use. For fully-ATE (automatic test equipment) applications, where possible distraction of the instrument user is not a risk, **Full** NFE is recommended.

NFE On/Off Command

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear. In those cases, the SCPI command is accepted without error, but has no effect
Couplings	When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the **Characterize Noise Floor** operation if it is needed When NFE is enabled through SCPI, and a **Characterize Noise Floor** operation is needed, an error is entered in the system error queue
Preset	Unaffected by **Mode Preset**. Turned `ON` at startup and by **Restore Mode Defaults** in Modes that support **Adaptive**. Turned `OFF` at startup and by **Restore Mode Defaults** in Modes that do *not* support **Adaptive** In Modes that support **Adaptive** NFE, the default (preset) state of NFE is **Adaptive**. In Modes that do not support **Adaptive** NFE, the default state of NFE is **Off**
State Saved	No

Adaptive NFE Command

Only effective in instruments with the NFE or NF2 license installed, and in Modes that support **Adaptive** NFE. For coverage, see "Adaptive Option Support" on page 443 above.

For all other cases, the SCPI command below is accepted without error, but has no effect.

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAptive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAptive?`

Example	First turn NFE on, this is **Full** mode
	`:CORR:NOIS:FLO ON`
	Then set it to **Adaptive**
	`:CORR:NOIS:FLO:ADAP ON`

Couplings	To maintain backwards compatibility, sending :`CORR:NOIS:FLO ON` turns NFE **Adaptive**`OFF`. To turn

	Adaptive on, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by **Mode Preset**, but set to `ON` at startup and by **Restore Mode Defaults**
State Saved	No

Optimal Detector & Averaging Selections

Note that some measurements do not allow you to switch the **Detector** type (which is set by default to **Average**), so the discussion of detector types here is irrelevant for those measurements. Similarly, some measurements do not allow you to set **Average Type** (set by default to `LOG`), so that discussion here is irrelevant in those cases.

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to obtain the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when **Detector** is **Average** and **Average Type** is set to **Power** (`RMS`).

For best operation, **AverageDetector** (default) and **Average Type**. = **Power** are recommended, as already stated. In other cases, operation is often not quite as good but still highly effective. Other **Detector** options, when available, behave as follows:

Positive Peak	The noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage **Positive Peak** is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise For pulsed-RF, **Positive Peak** can still give excellent effectiveness FFT analysis does not work well, and does not perform NFE well, with pulsed-RF signals, so this combination is *not* recommended
Negative Peak	Not very useful

Sample	Works well, but never better than **Average** , because it does not smooth as well
Normal	A combination of peak and negative peak behaviors, and works about as well as these

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points makes the buckets longer.

For best operation, **Average Type** = **Power** (`RMS`) is optimal (when this option is available). When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. Using NFE with **Average Type** = **Log-Power** (`LOG`) is not synergistic, though; NFE with **Average Type** = **Power** (`RMS`) works a little better than NFE with `LOG`.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that exceeds the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Recalibration of Noise Floor

In instruments with the NF2 license installed, the calibrated noise floor used by **Noise Floor Extension** should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. To do this, use "Characterize Noise Floor" on page 2128, under **System**, **Alignments**, **Advanced**. If you have not done this yourself at the recommended interval, then when you turn on **Noise Floor Extension**, the instrument will prompt you to do so with a dialog stating:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week

If you cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

Noise Source

Lets you turn the noise source power on or off and select the type of Noise Source to be used when making manual noise figure measurements.

See "More Information" on page 448.

Remote	`:SOURce:NOISe:TYPE NORMal | SNS`

Command	`:SOURce:NOISe:TYPE?`
Example	`:SOUR:NOIS:TYPE NORM`
Couplings	If no SNS is connected, this parameter is set to `NORMal` When Type is set to `SNS` and the SNS is disconnected, this parameter changes to `NORMal` When an SNS is not connected, the `SNS` option is grayed-out (disabled)
Preset	`NORMal`
State Saved	Saved in instrument state
Range	`NORMal | SNS`
Backwards Compatibility Notes	In previous Noise Figure analysis applications, this command could optionally be preceded with the `:SENSe` keyword. The optional `:SENSe` keyword is no longer supported

Auto Function

Remote Command	`:SOURce:NOISe[:STATe] ON | OFF | 1 | 0` `:SOURce:NOISe[:STATe]?`
Example	`:SOUR:NOIS OFF`
Couplings	If an SNS is connected, and the Type is set to `SNS`, this parameter turns the SNS on or off When an SNS is not connected, this parameter turns the BNC 28V output on or off When the SA mode is first entered, this parameter is set to `OFF`, and the 28v drive is `OFF` When the SA mode is exited, this parameter is set to `OFF` and the 28v drive is turned `OFF`
Preset	`OFF`

More Information

There are several types of noise source:

- 346/7 Series
- N4000 series Smart Noise Source (SNS)
- USB Noise Source (connects via USB rather than via the Noise Source connector on the rear panel)

This menu allows you to control any of these.

When an SNS is connected, you can select it from the **Type** dropdown, allowing the **State** parameter to then control the SNS. The `NORMal` source is controlled by a BNC connector that supplies 28V. If SNS is *not* connected, then the “state” parameter controls the `NORMal` noise source 28V BNC port. If both are connected, the **Type** parameter determines which source the **State** parameter controls. Two sources can never be controlled together. The query "SNS Attached (Remote Query Only)" on page 449 can be used remotely to determine whether an SNS is connected. SNS functionality is limited to turning on or off only. The SNS ENR data and temperature cannot be queried, unless Noise Figure Mode is installed. The SNS ENR data is issued in printed form when an SNS is purchased, or can be read using the instrument's Noise Figure Mode if installed, or other Keysight noise figure instruments that support the SNS.

Only one SNS is supported at a time. To switch to a different SNS (a USB SNS or an N4000 series SNS), disconnect the one that is no longer being used prior to connecting a new one.

When you switch to the Swept SA measurement, the **State** is `OFF` and the 28v BNC drive and SNS is turned off to ensure the two are in sync. When you exit the Swept SA measurement, **State** is set to `OFF`, and the 28v BNC and SNS drive are turned off.

For making manual noise figure measurements, the following setup is recommended:

- Set **Span** to Zero
- Set **Attenuation** to 0 dB
- Set the PRE-AMP `ON`
- Set **Res BW** to 4 MHz
- Set **Detector** to `AVERage`
- Set **Sweep Time** to 16 ms - sets the variance correctly for good results.
- Set a **Band/Interval Power Marker** function, and set the interval over the full width of trace; that is, **Left** = 0s and **Right** = 16 ms

SNS Attached (Remote Query Only)

If a Smart Noise Source (SNS) is present, returns 1, otherwise 0.

Remote Command	`:SOURce:NOISe:SNS:ATTached?`
Example	`:SOUR:NOIS:SNS:ATT?`
Preset	`OFF`
State Saved	No
Backwards Compatibility Notes	In previous Noise Figure analysis applications, this command could optionally be preceded with the `:SENSe` keyword. The optional `:SENSe` keyword is no longer supported

ACP Enhanced Dynamic Range On/Off

Causes a 300 kHz SAW filter (also called the **ACP Filter**) to be switched into the signal path to allow third-order critical measurements, such as ACP measurements, to be made with improved dynamic range when the spectrum is substantially wider than 300 kHz. When **ACP Enhanced Dynamic Range** is ON:

- When **Res BW** ≤ 300 kHz, the **ACP Filter** is switched in. This means that the **Res BW** shape is affected, but not excessively
- When **Res BW** > 300 kHz, ACP Enhanced Dynamic Range causes no changes in the signal path

NOTE **This function should be used only under specific measurement scenarios, such as ratio measurements of intermodulation, to avoid adding other measurement inaccuracies, such as Frequency Readout Accuracy, Res BW amplitude accuracy, power bandwidth accuracy and absolute amplitude accuracy.**

Remote Command	`[:SENSe]:IF:EDRange ON | OFF | 1 | 0` `[:SENSe]:IF:EDRange?`
Example	`:IF:EDR ON`
Preset	`OFF`
State Saved	Saved in instrument state

3.2.8.7 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "Global Center Freq" on page 2013) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to ON, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched ON, the current Mode’s center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is ON, modifies the **Global Center Freq**.

When **Global Center Freq** is switched OFF, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is ON, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to OFF when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	ALL|NONE

Preset	OFF
Backwards Compatibility SCPI	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`

Global EMC Std

When this control is switched ON, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is ON modifies the **Global EMC Std**.

When **Global EMC Std** is switched OFF, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is ON, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to OFF when "Restore Defaults" on page 2016 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:EMC:STANdard ALL | NONE` `:INSTrument:COUPle:EMC:STANdard?`

Example	`:INST:COUP:EMC:STAN ALL` `:INST:COUP:EMC:STAN?`
Dependencies	Only available if Option EMC is installed
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Global Limit Lines (Freq and Amptd)

When this control is set to `ALL`, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use **Global Limit Lines**, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global** Settings, while **Global Limit Lines** is `ALL`, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to `NONE`, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is `ALL`, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to `NONE` when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:LLINe ALL | NONE` `:INSTrument:COUPle:LLINe?`
Example	`:INST:COUP:LLIN ALL | NONE` `:INST:COUP:LLIN?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned `ON`, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to `OFF` when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON|OFF`

Restore Defaults

Resets all functions in the **Global** settings menu to `OFF`. Pressing **System**, **Restore Defaults**, **All Modes** has the same effect.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.2.8.8 Source

Accesses menus for controlling a Tracking Source in Tracking Source mode.

Does not appear in instruments that do not support Tracking Source functions, such as most of the modular instruments (including VXT), and UXM.

Some instruments (such as VXT) contain an Independent Source, which is controlled using the **RF Source** tab in the **Input/Output** menu.

Dependencies	Only appears in the Swept SA measurement of Spectrum Analyzer Mode Operation with a tracking source requires a license, such as ESC or TG3. If the proper license is not installed, the **Source** tab does not appear, and sending any SCPI command in the `:SOURce` subsystem generates a message, "Settings conflict; option not installed"

NOTE **Option T03 or T06 is required for the Tracking Generator function in CXA.**

Option T03, T07, T13 or T26 is required for the Tracking Generator function in CXA-m.

CXA-m TG Uncalibrated Amplitude Range

When using the CXA-m Tracking Generator, if the Source Frequency is in any of the frequency ranges in the table below, and the Source Amplitude is in the corresponding amplitude range of the below table, a warning status message is generated, +313 “Source Uncal”. This is also true if **Power Sweep** is ON and any amplitude in the Power Sweep (as calculated by Amplitude, Power Sweep, and Amptd Offset) is in that range.

Frequency Range	Amplitude Range
2 MHz ≤ frequency < 10 GHz	-40 dBm ≤ amplitude < -35 dBm
10 GHz ≤ frequency < 20 GHz	-40 dBm ≤ amplitude < -35 dBm or -5 dBm < amplitude ≤ 0 dBm
20 GHz ≤ frequency ≤ 26.55 GHz	-12 dBm < amplitude ≤ 0 dBm

RF Output

Turns source RF Power on or off.

NOTE As stated below, when the RF Output is ON, "Source Mode" on page 456 is set to **Tracking**. See the **Source Mode** control description for special considerations concerning how to configure an N5172B or N5182B source for use with External Source Control.

Remote Command	`:OUTPut[:EXTernal] [:STATe] ON | OFF | 1 | 0` `:OUTPut[:EXTernal] [:STATe]?`
Example	`:OUTP ON` `:OUTP?`
Dependencies	Grayed-out in measurements that do not support a source. If you switch to such a measurement, the output is forced to OFF Grayed-out if there is no valid source selection. In this case, go to the **Select Source** menu to choose, configure and/or verify your source When there is no available Source Mode (other than OFF), due to other couplings, then **RF Ouput** is grayed-out
Couplings	When **RF Output** is turned ON, **Source Mode** is set to **Tracking** When **Source Mode** is turned OFF, **RF Output** is turned OFF When **Source Mode** is turned OFF (or forced to OFF by another coupling), **RF Output** is turned OFF Turning **RF Output**OFF does not affect **Source Mode** or other settings
Preset	OFF On either **Mode Preset**, **Source Preset**, or **Restore Input/Output Defaults**

State Saved	Part of the **Input/Output** system, which means it is loaded and saved with state
Range	ON|OFF
Annunciation	The Source annotation in the Meas Bar shows Off if Source Mode is Off, “Trk, RF off” if Source Mode is Tracking but RF is off, and “Trk, RF on” if Source Mode is Tracking and the RF output is on 

Source Amplitude

Adjusts the power level of the selected source. Note that the actual amplitude is also affected by Amplitude Offset and Power Sweep.

Remote Command	:SOURce[:EXTernal]:POWer[:LEVel][:IMMediate][:AMPLitude] <ampl> :SOURce[:EXTernal]:POWer[:LEVel][:IMMediate][:AMPLitude]?
Example	:OUTP ON :SOUR:POW -10dBm
Dependencies	If the requested setting of Source Amplitude causes the calculated external source start or stop Amplitude to exceed the external source capability, a warning status message is generated, “Data out of Range; clipped to source max/min” The “Show Source Capabilities and Settings” menu can then be examined to check the source capabilities This parameter test and clip is also performed at source acquisition See also "CXA-m TG Uncalibrated Amplitude Range" on page 454
Preset	-10.00 dBm (On Source Preset and Restore Input/Output Defaults) Not affected by Mode Preset
State Saved	Part of the Input/Output system, which means it is Loaded and Saved with state
Min/Max	The range of the amplitude parameter is dependent on the amplitude range of the source that is selected, and the settings of Amplitude Offset and Power Sweep
Backwards Compatibility SCPI	:SOURce:POWer:STARt <ampl> :SOURce:POWer:STARt?
Backwards Compatibility Notes	This alias is for the ESA tracking generator. It specifies the source output power level at the start of the power sweep, just as does :SOURce:POWer

Tracking Peak

Activates a routine that adjusts the delay of the instrument’s tuned frequency with respect to the tracking generator output in order to guarantee that the measurement is peaked in amplitude. This delay is automatically determined by the instrument, in order to accommodate the delay of the DUT and its cables. The resulting delay from this adjustment is displayed on the Manual Track Delay control and may then be further adjusted by the user.

This delay is most critical when the sweep rates are very high, over 108 Hz/s. The adjustment routine works best at these high sweep rates. Once set, this delay will usually not need to be adjusted again unless the DUT or cable lengths are changed.

When the signal to noise ratio is not good enough for the instrument to determine a valid delay time, an error message is returned.

If the sweep time is larger than 30 seconds, the tracking peak function would occupy an unacceptably large amount of time, since it has to take a sweep to function, so it does not execute. In this case when you press the Tracking Peak key, the instrument will not execute the tracking peak function, but instead retain the old track delay value and give you a message.

Remote Command	`:SOURce:POWer:TRCKing:PEAK`
Example	`:SOUR:POW:TRCK:PEAK` Peak the Tracking Generator
Dependencies	If the currently selected source does not support this capability (for example, an external tracking source), this control does not display This control does not appear unless you are in Tracking Source mode

Source Mode

Lets you select Tracking mode for the Source, and allows you to set **Source Mode** to `OFF`

Source Mode can be set to `TRACking` without the user setting it directly. There are several couplings that cause **Source Mode** to be automatically set to `TRACking` (detailed in the table below). One important coupling is that **Source Mode** is forced to `TRACking` when the RF Output is turned on if the measurement supports Tracking. Since **Source Mode** is set to `OFF` by **Mode Preset**, this means that you will rarely need to change the **Source Mode** setting directly.

NOTE: When **Source Mode** is set to `TRACking`, the instrument acquires control of the source. When this happens, the source is told to save its state and then perform a preset. Usually both of these operations take very little time; however, on an N5172B or an N5182B, if many Source real-time apps are in use, both save and preset can take many seconds. If it takes longer than the instrument expects to acquire control, you will see an error: “Source connection lost, check interface connection”. If you see this error, and you are using an N5172B or an N5182B, you can shorten the acquire time by presetting your MXG before attempting to use External Source Control.

Remote Command	`:INSTrument:SOURce[:SELect] TRACking | OFF`

	`:INSTrument:SOURce[:SELect]?`
Example	`:INST:SOUR TRAC`
Dependencies	Grayed-out if no Source is selected. In this case go to the Select Source menu to select, configure and/or verify your source Grayed-out and forced to Off if either BBIQ or External Mixing are selected Grayed-out in Measurements that do not support a source **Tracking** is grayed-out when Manual FFT is selected **Tracking** is grayed-out when the RF Preselector is on (in models which support the RF Preselector)
Couplings	When RF Output is turned On, **Source Mode** is set to `TRACking`. When **Source Mode** is turned `OFF`, RF Output is turned Off Whenever you switch to a Mode in which the **Source Mode** was previously set to `TRACking`, it is again set to `TRACking`. That is, the last setting of the **Source Mode** is remembered when you leave a Mode and restored when you return **Source Mode** is forced to `TRACking` when the RF Output is turned on, if the measurement supports Tracking If **Source Mode** is set to `TRACking`, then it is forced to `OFF` when you select a measurement that does not support Tracking If TRACking is set to `TRACking`, then it is forced to `OFF` when you turn on the RF Preselector (in models which support the RF Preselector) Whenever **Source Mode** is set to `TRACking`, the instrument acquires the Source. Similarly, the Source is released whenever **Source Mode** is set to `OFF`. This is true whether **Source Mode** was set directly by you, was set indirectly through a coupling, if you switched to a Mode that had previously been set to `TRACking`, or if you switched to a Mode in which **Source Mode** is not set to `TRACking` For an external source, “acquiring the source” involves contacting the external instrument over the remote interface (which puts it into Remote) and taking control of it When you set **Source Mode** to `OFF`, it releases the Source (and puts it into Local). For an external source, this means you are now free to operate the source for other purposes When the Source is acquired, its previous state is saved, and when it is released, that state is restored, so that you can acquire and then release the source and it will return to the state it was in before you acquired it
Preset	`OFF`
State Saved	Saved in instrument state
Annunciation	If the Source Mode is off, the settings panel at the top of the screen shows:  See the RF Output control for the case where the Source Mode is Tracking

When the instrument acquires the Source, the following things happen:

1. The instrument attempts to verify communication with the selected source. If the communication somehow fails, the Source Mode is set to Off, and the instrument will report a message “System Error; source connection lost, check interface

connection”. This will also happen if at any time, during normal operation, the source connection fails after having been successfully acquired Note that even if this happens the current Source is not removed from the list of available sources

2. If the communication succeeds, the source goes to Remote. The instrument then commands the external source to save its current state in one of its own internal state registers (Seq 0, state 99)
3. The instrument examines its current Source State and if the settings for the sweep exceed the capabilities of the configured source it clips the settings and displays an informational message, “Some source settings changed to match source limits.” The sweep setting is forced to a setting that allows the source to sweep. The user can then reconfigure the sweep settings one at a time to see which is in conflict. The menu: Show Source Capabilities and Settings... can be used to show potential settings conflicts with the source capabilities
4. The following clip is performed to ensure that the instrument’s current settings of max and/or min frequency do not exceed the capabilities of the source:

   Instrument start frequency = max\{instrument current frequency, source minimum frequency\}

   Instrument stop frequency = min\{instrument current frequency, source maximum frequency\}

In other words, if the instrument’s current state contains a frequency that is outside the frequency range of the Source, the instrument State is clipped to conform to the capabilities of the source. If this happens, an informational message is displayed, “Some analyzer settings changed to match source limits.”

1. Once the Source is acquired, other Auto coupled instrument sweep parameters are changed to perform the Stimulus/Response measurement
2. Additionally, once the Source is acquired, some Source State variables will need to be Preset if they cannot be supported by the current source. These include Multiplier Numerator , Multiplier Denominator, Reverse Sweep, and Source Freq Offset
3. The instrument writes its current (updated) Source State to the source

After this has been done, the source and instrument will operate together in “tracking” mode, which, for an external source, includes a software or hardware handshake for synchronization

If any subsequent setting change of the instrument causes a conflict regarding the calculated source settings (for example, frequency/amplitude/trace point beyond the source ranges), the instrument will clip to the source max/min and generate a warning message, -221 “Data out of Range; clipped to source max/min”.

When the Source is released, the instrument commands the external source to recall its state from its own internal state register (Seq 0, state 99) thus leaving the source in its pre-acquisition state, and the instrument measurement couplings and dependencies are removed, allowing the measurement to return to its normal, non-tracking state. It also puts the Source in Local.

Source Setup Table

Accesses various setup parameters for the Source. In addition, the results of the source control sweep algorithms can be viewed. This gives information of the source range required for a given instrument sweep range. This can be used dynamically as a way of configuring the sweep settings.

Point Trigger: Lets you set up how you want to trigger the source as it steps from frequency to frequency. For more on triggering in Tracking Mode, see "Tracking Setup Details" on page 461.

Amplitude parameters: Power Sweep, Amplitude Offset, Amplitude Step. The resolution of the Source amplitude parameters is coupled to match the minimum resolution of the source when the source is acquired. When the source is released, the amplitude parameter resolution reverts to default values.

Frequency parameters: Multiplier (Numerator and Denominator), Reverse Sweep, Freq Offset. These controls give you added flexibility when using a stepped tracking source for stimulus/response measurements.

- Because with a stepped source, the source frequency does not need to track 1:1 with the instrument LO frequency, it is possible to measure scalar harmonic and subharmonic responses of devices. For example, the second harmonic response is measured by stepping the instrument and source so that the instrument is always at twice the source frequency.
- In addition, the frequency offset capability allows the measurement of frequency conversion devices (like mixers).
- In tracking mode, the source frequency tracks the instrument frequency according to the source frequency equation:

Source Frequency = (Analyzer Frequency *Multiplier Numerator / Multiplier Denominator) + Source Frequency Offset

NOTE **In the above equation, Analyzer Frequency is the frequency to which the instrument is set, which is the instrument's displayed frequency, offset by any Freq Offset set under the Frequency hardkey. Source Frequency Offset is the value set under Source, Frequency, Freq Offset.**

For some Stimulus/Response measurements you may wish to bypass the Microwave Preselector. For information on bypassing the Microwave Preselector, see "Use of the YTF (Microwave or mm Preselector) with External Source Control" on page 460

Example calculations:

Source Frequency = (Analyzer Frequency * Multiplier Numerator / Multiplier Denominator) + Offset Frequency				
Analyzer Start Freq (Hz)	**Analyzer Stop Freq (Hz)**	**Multiplier (Num/Den)**	**Offset Freq (Hz)**	**Source Freq (Hz)**
1.0e6	2.0e6	1/1	0.0	1.0e6 – 2.0e6
2.0e6	4.0e6	1/1	100.0e6	102.0e6 – 104.0e6
2.0e6	4.0e6	-1/1	100.0e6	98.0e6 – 96.0e6
102.0e6	104.0e6	1/1	-100.0e6	2.0e6 – 4.0e6
98.0	96.0e6	-1/1	100.0e6	2.0e6 – 4.0e6
3.0e6	4.0e6	3/1	0.0	9.0e6 – 12.0e6
4.0e6	6.0e6	5/1	100.0e6	120.0e6 – 130.0e6
4.0e6	6.0e6	-5/1	100.0e6	80.0e6 – 70.0e6

Use of the YTF (Microwave or mm Preselector) with External Source Control

In most stimulus/response measurements that utilize External Source Control, the source exactly tracks the tuned analyzer frequency. Consequently, preselection is not needed, and you can achieve greatly superior amplitude accuracy and repeatability by bypassing the YTF (Preselector) using the Microwave Preselector Bypass control in the Amplitude, uW Path Control menu (note: this control is only available if option MPB is installed).

There are rare but important cases, however, where the source is tuned to a different frequency than the analyzer, using the Multiplier and Reverse controls in the Source, Frequency menu. For example, you might be tuning the source to ½ of the analyzer frequency when looking at second harmonic distortion in a DUT. In these cases, it would be commonplace for there to be an undesired signal at the analyzer input that is at an image frequency that you will want to reject with the YTF.

Understanding these cases is important for proper operation of the Microwave Preselector with External Source Control, so that you only bypass it when it will improve accuracy but not hinder the measurement.

Point Trigger

Shows point trigger type selected and navigates to the **Point Trigger** menu, which lists all instrument point trigger types.

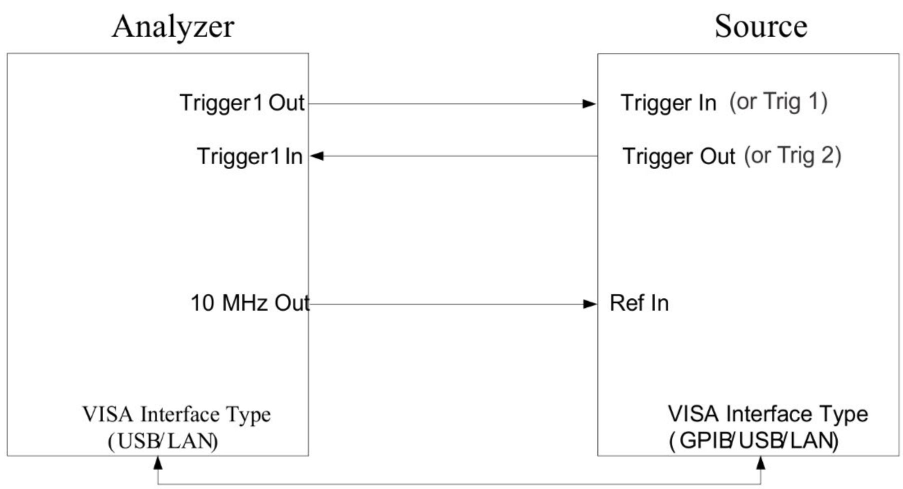
The instrument and source point trigger synchronization can be done using SCPI bus commands or by using external trigger output and input lines.

NOTE **For X-Series software versions earlier than A.10.01, hardware triggering was unavailable in stepped tracking at frequencies above 3.6 GHz, so above 3.6 GHz, software triggering was always used. This is no longer the case.**

Remote Command	`:SOURce:TRIGger:TYPE BUS | EXTernal[1] | EXTernal2` `:SOURce:TRIGger:TYPE?`
Example	`:SOUR:TRIG:TYPE EXT1` Selects instrument external trigger 1 in and out for point trigger synchronization with selected source
Dependencies	If an internal Tracking Generator is selected, then this menu is unavailable, Additionally, the External 1 and External 2 Trigger keys on the Spectrum Analyzer are released from any grayout that may have been forced on them by the external source Point Trigger selection In some models, there is no second External input. In these models, the External 2 selection does not appear and the EXTernal2 parameter will generate a “Hardware missing; Not available for this model number” message
Couplings	The source control point trigger selection can select external trigger 1 or 2 in for synchronized point triggering. This can conflict with the selection under the **Trigger** hardkey, if it has **External 1** or **2** selected. If there is a conflict when the selection is made under the **Point Trigger** menu, the **Trigger** selection under the **Trigger** hardkey changes to **Free Run**
Preset	Unaffected by **Mode Preset** but set to `EXTernal1` by **Source Preset** or **Restore Input/Output Defaults**
State Saved	Part of the Input/Output system, which means it is Loaded and Saved with state

Tracking Setup Details

When an external source is operating in Tracking Mode, operation can be greatly enhanced by using hardware triggers. Below is a typical connection diagram showing a hardware handshake using Trigger 1 inputs and outputs on the instrument (trigger 2 in and out is also a valid connection).



Typical Analyzer-Source connection

Analyzer Trigger 1 Out: Triggers the external source to step to next point in the frequency step/list.

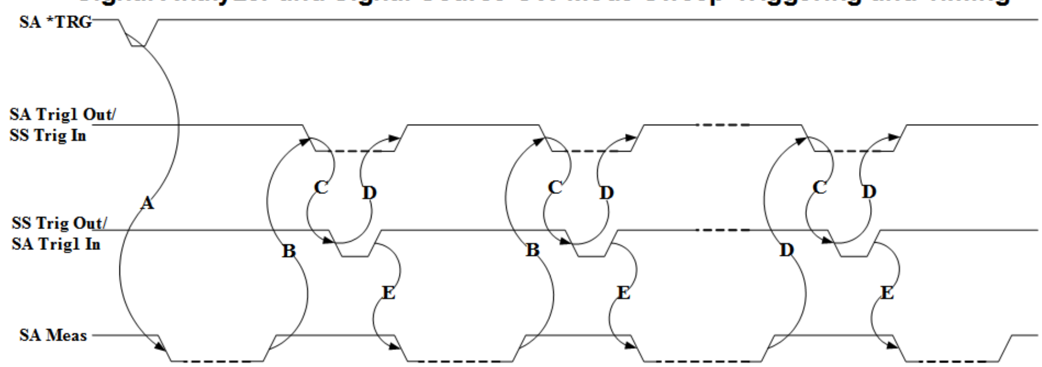
Analyzer Trigger 1 In: Triggers the analyzer to make a measurement on this point

Source Trigger In (or “Trig 1” at default setting for N5181B/82B, N5183B MXG or N5171B/72B, N5173B EXG):
Triggers the source to step to the next point.

Source Trigger Out (or “Trig 2” at default setting for N5181B/82B, N5183B MXG or N5171B/72B, N5173B EXG): Indicates that the source has settled.

IO interface Connection: instrument can connect to sources with its GPIB, USB or LAN interface.

Signal Analyzer and Signal Source CW Mode Sweep Triggering and Timing



A- Test system triggers SA sweep programmatically (*TRG). First point measurement started
B - SA finishes measurement and triggers SS to move to next sweep point by pulling SA Trigger 1 Out low
C - SS pulls SS Trigger Out line low and steps to next sweep point
D - SA releases SA Trigger 1 Out line (timing not crucial; OK to release on SS Trig Out line high or after meas)
E - SS source settles and releases SS Trig Out line, triggering SA to start next point measurement

Notes:

- Trigger sync connections are optional – synchronization can be done via remote commands if Bus Trigger is enabled in the Source Setup menu.
- Connection from the SA external frequency reference output to the source frequency reference input (10 MHz Out to Ref In) is not required, but may improve the measurement accuracy.

SW Trigger

Analyzer and source point trigger synchronization is setup using the SCPI commands. Source is stepped via SCPI commands. Analyzer waits for source to settle by polling source.

SCPI example: `:SOUR:TRIG:TYPE BUS`

Ext Trigger 1

SCPI example: `:SOUR:TRIG:TYPE EXT1`

Analyzer and source point trigger synchronization is setup using the analyzer Trigger 1 Output and Trigger 1 Input. The Source is stepped via Trigger 1 Output. The Analyzer waits for source to settle via Trigger 1 Input.

With an acquired source, selecting this point trigger mode overrides existing external trigger 1 output level, slope, and delay, and external trigger 1 type and polarity.

External trigger 1 input level = 1.20 V

External trigger 1 input slope = Positive

External trigger 1 input delay = Off

External trigger 1 output type = Source Point Trigger

External trigger 1 output polarity = Positive

When this selection is made:

- The **External 1** selection in the **Trigger** menu (under the **Trigger** hardkey) does not appear and, if **External 1** was previously selected, it changes to **Free Run**
- **Trig 1 Out** selected under **Output Config** in the **Input/Output** menu changes to **Source Point Trigger**

If you subsequently go into the **Trig 1 Out** menu and select a different Trigger Output, the **Point Trigger** reverts to SW Trigger.

Ext Trigger 2

Analyzer and source point trigger synchronization is setup using the analyzer Trigger 2 Output and Trigger 2 Input. The Source is stepped via Trigger 2 Output. The instrument waits for source to settle via Trigger 2 Input.

SCPI example: `:SOUR:TRIG:TYPE EXT2`

With an acquired source, selecting this point trigger mode overrides existing external trigger 2 output level, slope, and delay, and external trigger 2 type and polarity.

External trigger 2 input level = 1.20 V

External trigger 2 input slope = Positive

External trigger 2 input delay = Off

External trigger 2 output type = Source Point Trigger

External trigger 2 output polarity = Positive

When this selection is made:

- The **External 2** selection in the **Trigger** menu (under the **Trigger** hardkey) does not appear and, if **External 2** was previously selected, it changes to **Free Run**
- **Trig 2 Out** selected under **Output Config** in the **Input/Output** menu changes to **Source Point Trigger**

If you subsequently go into the **Trig 2 Out** menu and select a different Trigger Output, the **Point Trigger** reverts to SW Trigger.

Manual Track Delay

Lets you manually adjust the delay of the tracking generator oscillator using the step keys, knob, or numeric keypad. The tracking delay should be tuned to maximize the amplitude of the trace. Generally, you should only need to perform this adjustment if the characteristics of your setup make it difficult for the instrument to accurately determine the correct delay with the Tracking Peak function (for example, your DUT may not be passing enough signal at the desired frequency for Tracking Peak to work properly). Any time you change the DUT, it is a good practice to set the Manual Track Delay to 0.

Remote Command	`:SOURce:POWer:TRCKing <integer>` `:SOURce:POWer:TRCKing?`
Example	`:SOUR:POW:TRCK 120` Set Man Track Adjust to 120
Dependencies	If the currently selected source does not support this capability (for example, an external tracking source), this key does not appear This key does not appear unless you are in Tracking Source mode
Preset	Unaffected by Preset. Set to 0 by **Restore Input/Output Defaults**
State Saved	Part of the **Input/Output** system, which means it is loaded and saved with state
Min	0
Max	10 us

Save/Restore Source State

Lets you disable the ability of the External Source to return to the state it was in before it was acquired.

Normally, when the instrument acquires the Source, the Source saves its state in an internal register. Then, when the instrument releases the Source, it restores its previous state from that register.

You may wish to defeat this feature, to save time when acquiring/releasing the Source. If so, turn this function Off. The default state is On. Once set to On, it stays On until you turn it Off, shutdown the instrument or perform a Restore Mode Defaults.

Remote Command	`:SOURce:STATe:RESTore ON | OFF | 0 | 1` `:SOURce:STATe:RESTore?`
Example	`:SOUR:STAT:REST OFF` `:SOUR:STAT:REST?`
Notes	You must be in Spectrum Analyzer Mode to use this command. Use `:INSTrument:SELect` to set

	the Mode
Dependencies	If the currently selected source does not support this capability (for example, an internal Tracking Generator which must track the LO), this control is forced to its Preset value and grayed-out
Preset	Unaffected by Mode Preset but is set to ON by Restore Mode Defaults
Range	ON|OFF

Power Sweep

Sets up a Power Sweep. **Power Sweep** is useful for measuring saturation behavior in a test device, such as a power amplifier.

The source will sweep the power between the start power defined by the Amplitude function and the stop power = start power + power sweep value:

Source (start) amplitude = Amplitude – Amplitude Offset

Source (stop) amplitude = Amplitude – Amplitude Offset + Power Sweep

In Stepped Tracking, such as is used with an external source or the CXA-m TG, the instrument controls the source with step sweep mode, which provides a linear progression from one selected frequency, amplitude, or both, to another, pausing at linearly spaced points (steps) along the sweep. The instrument continues to sweep the specified frequency range when power sweep is on, although generally Power Sweep is performed in Zero Span.

With CXA options T03, T06 , the hardware is capable of continuous power sweeps. This makes it possible to use the swept sweep time rules and should be employed for faster sweeps. Care should be taken to limit the sweep time you use as there are no sweep time couplings to Power Sweep settings. The recommended minimum sweep time depends on the RBW and power-sweep range. Start by computing (1.28/RBW)* (abs(startPower – stopPower)/(5 dB)). The recommended minimum sweep time is the larger of this value and 50 ms.

Some external Sources have mechanical attenuators, which are not used in Power Sweep in order to save wear on the attenuators. To allow an acceptable range of Power Sweep without changing the mechanical attenuation, the Sources are put in a mode that allows the Source to handle a wide amplitude range without switching the attenuators. When the Power Sweep settings put the Source in an amplitude range that requires the mechanical attenuators, the instrument displays a condition warning message:

Settings Alert; Src pwr ramp>ALC range

Remote Command	`:SOURce:POWer:SWEep <rel_ampl>` `:SOURce:POWer:SWEep?`
Example	`:SOUR:POW -5` `:SOUR:POW:SWE:STAT ON`

	`:SOUR:POW:SWE 10`
	Set source start power to - 5 dBm and stop power + 5dBm (-5 + 10)
	`:SOUR:POW:SWE:STAT ON`

Dependencies	If the requested setting of **Power Sweep** causes the calculated external source start or stop Amplitude to exceed the external source capability, a warning status message is generated, "Data out of Range; clipped to source max/min". The Show Source Capabilities and Settings menu can then be examined to check the source capabilities This parameter test and clip is also performed at source acquisition See also "CXA-m TG Uncalibrated Amplitude Range" on page 454
Preset	This is unaffected by "Mode Preset" but is set to 0dB on a "Source Preset" or "Restore Input/Output Defaults"
State Saved	Part of the Input/Output system, which means it is Loaded and Saved with state
Min/Max	–/+500 dB
Backwards Compatibility SCPI	`:SOURce[:EXTernal][:SWEep]:POWer:SPAN <rel_ampl>` `:SOURce[:EXTernal][:SWEep]:POWer:SPAN?`
Backwards Compatibility Notes	This alias is for the ESA tracking generator and PSA option 215. It specifies the range of power levels through which the source output will sweep just as does `:SOURce:POWer:SWEep`

Auto Function

Remote Command	`:SOURce:POWer:SWEep:STATe ON | OFF | 1 | 0` `:SOURce:POWer:SWEep:STATe?`
Preset	Unaffected by **Mode Preset** but set to `OFF` by **Source Preset** or **Restore Input/Output Defaults**

Backwards Compatibility Command

Notes	The ESA tracking generator and the PSA option 215 support this SCPI command. It sets the source output to be at a single amplitude (fixed) or to sweep through a range of power levels
	`:SOURce:POWer:MODE FIXed`
	is equivalent to `:SOURce:POWer:SWEep:STATe OFF`
	`:SOURce:POWer:MODE SWEep`
	is equivalent to `:SOURce:POWer:SWEep:STATe ON`

Preset	Unaffected by **Mode Preset** but set to `FIXed` by **Source Preset** or **Restore Input/Output Defaults**
Backwards Compatibility SCPI	`:SOURce[:EXTernal]:POWer:MODE FIXed | SWEep` `:SOURce[:EXTernal]:POWer:MODE?`

Amptd Offset

Offsets the displayed power of the source in the Amplitude parameter. Using the amplitude offset allows you to take into account any system losses or gains (for example, due to cable loss), thereby displaying the actual power delivered to the device under test. See the equations under **Source**, **Amplitude**, "Power Sweep" on page 466.

Remote Command	`:SOURce:CORRection:OFFSet <rel_ampl>` `:SOURce:CORRection:OFFSet?`
Example	`:SOUR:CORR:OFFS 5` Sets the displayed source offset power to 5 dB
Dependencies	If the requested setting of Amptd Offset causes the calculated external source start or stop Amplitude to exceed the external source capability, a warning status message is generated, “Data out of Range; clipped to source max/min”. The Show Source Capabilities and Settings menu can then be examined to check the source capabilities This parameter test and clip is also performed at source acquisition
Preset	Unaffected by Mode Preset but is set to 0.00dBm on a Source Preset or Restore Input/Output Defaults
State Saved	Part of the **Input/Output** system, which means it is loaded and saved with state
Min/Max	–/+1000 dB

Amptd Step

Sets the step size associated with the Source Amplitude key. When auto-coupled, the step size is the current "Scale/Div" on page 202 setting under the **Amplitude** hardkey (note that this is true even if the instrument is currently in Linear amplitude scale).

Once a step size has been selected and the Source Amplitude function is active, the step keys (and the `UP|DOWN` parameters for Source Amplitude from remote commands) change the Source Amplitude by the step-size value.

You may change the step size manually by pressing Amptd Step and entering a value. The function (and the step size) will return to **Auto** when **Mode Preset** or "Auto Couple" on page 1995 is performed.

Remote Command	`:SOURce:POWer:STEP[:INCRement] <ampl>` `:SOURce:POWer:STEP[:INCRement]?`
Example	`:SOUR:POW:STEP 0.1` Set amplitude step to 0.1 dB
Couplings	In **Auto**, coupled to the size of one logarithmic vertical graticule division
Preset	Auto
State Saved	Part of the **Input/Output** system, which means it is loaded and saved with state
Min	0.1 dB
Max	20 dB

Auto Function

Remote Command	`:SOURce:POWer:STEP:AUTO OFF | ON | 0 | 1` `:SOURce:POWer:STEP:AUTO?`
Example	`:SOUR:POW:STEP:AUTO ON`
Preset	`ON`
State Saved	In Input/Output state

Multiplier Numerator

This parameter offsets the source frequency from the instrument frequency. The source frequency tracks the SA frequency according to the source frequency equation shown at the bottom of the Source Setup Table.

Remote Command	`:SOURce:FREQuency[:MULTiplier]:NUMerator <integer>` `:SOURce:FREQuency[:MULTiplier]:NUMerator?`
Example	`:SOUR:FREQ:NUM 3` Sets the source frequency multiplier numerator to 3
Dependencies	If the currently selected source does not support this capability (for example, an internal Tracking Generator which must track the LO), this control is forced to its Preset value and grayed-out
Preset	Unaffected by Mode Preset but is set to 1 on Source Preset or Restore Input/Output Defaults
State Saved	Part of the **Input/Output** system, which means it is loaded and saved with state
Min	1
Max	1000

Multiplier Denominator

This parameter offsets the source frequency from the instrument frequency. The source frequency tracks the SA frequency according to the source frequency equation shown at the bottom of the Source Setup Table.

Remote Command	`:SOURce:FREQuency[:MULTiplier]:DENominator <integer>` `:SOURce:FREQuency[:MULTiplier]:DENominator?`
Example	`:SOUR:FREQ:DEN 3` Sets the source frequency multiplier denominator to 3
Dependencies	If the currently selected source does not support this capability (for example, an internal Tracking Generator which must track the LO), this control is forced to its Preset value and grayed-out
Preset	Unaffected by Mode Preset but is set to 1 on Source Preset or Restore Input/Output Defaults
State Saved	Part of the **Input/Output** system, which means it is loaded and saved with state
Min	1
Max	1000

Source Sweep Reverse

Lets you reverse the source sweep direction

Normally, the source will sweep from a lower frequency to a higher frequency. However, there are test scenarios in which the source sweep needs to be “reversed”. In this case, it sweeps from a higher frequency to a lower frequency. For example, when the DUT is a frequency converter and a measurement of the Lower Side Band characteristics is desired, a reverse sweep is employed. Reverse sweeps are supported for such scenarios, but two cautions are in order:

1. Reverse Sweep only reverses the direction of the source’s sweep, not the instrument’s sweep. Unless you are actually using a device like a frequency converter and looking at the lower sideband, thus effectively reversing the direction of the source’s sweep, the source will be sweeping in the opposite direction from the instrument, and it will not be possible track the desired device output frequency

2. Any time you are using a frequency converter, care must be taken in setting up all of the sweep parameters, including instrument start/stop frequency and source multiplier, to make sure that the instrument’s sweep tracks the output of the converter device

Remote Command	`:SOURce:FREQuency:SSReverse ON | OFF | 0 | 1` `:SOURce:FREQuency:SSReverse?`
Example	`:SOUR:FREQ:SSR OFF` `:SOUR:FREQ:SSR?`
Notes	You must be in Spectrum Analyzer Mode to use this command. Use `:INSTrument:SELect` to set the Mode
Dependencies	If the currently selected source does not support this capability (for example, an internal Tracking Generator which must track the LO), this control is forced to its Preset value and grayed-out
Preset	Unaffected by Mode Preset but is set to `OFF` on Source Preset or Restore Input/Output Defaults
State Saved	Part of the **Input/Output** system, which means it is loaded and saved with state
Range	`ON|OFF`

Freq Offset

This parameter offsets the source frequency from the instrument frequency. The source frequency tracks the SA frequency according to the equations at the bottom of the Source Setup Table.

Remote Command	`:SOURce:FREQuency:OFFSet <freq>` `:SOURce:FREQuency:OFFSet?`

Example	`:SOUR:FREQ:OFFS 10MHz` Sets the source frequency offset to 10 MHz
Dependencies	If the currently selected source does not support this capability (for example, an internal Tracking Generator which must track the LO), this control is forced to its Preset value and grayed-out
Preset	Unaffected by Mode Preset but is set to 0.00Hz on Source Preset or Restore Input/Output Defaults
State Saved	Part of the **Input/Output** system, which means it is loaded and saved with state
Min	-500 GHz
Max	500 GHz
Backwards Compatibility SCPI	`:SOURce:EXTernal:SWEep:OFFSet:FREQuency <freq>` `:SOURce:EXTernal:SWEep:OFFSet:FREQuency?`
Backwards Compatibility Notes	PSA option 215 supports this command, which is equivalent to `:SOURce:FREQuency:OFFSet`

Auto Function

Remote Command	`:SOURce:FREQuency:OFFSet:STATe ON | OFF | 1 | 0` `:SOURce:FREQuency:OFFSet:STATe?`
Preset	This is unaffected by Mode Preset but is set to `OFF` on Source Preset or Restore Input/Output Defaults
Backwards Compatibility SCPI	`:SOURce:EXTernal:SWEep:OFFSet:STATe ON | OFF | 1 | 0` `:SOURce:EXTernal:SWEep:OFFSet:STATe?`
Backwards Compatibility Notes	PSA Option 215 supports this SCPI command. It is equivalent to `:SOURce:FREQuency:OFFSet:STATe`

Select Source

Allows you to maintain a list of available external and internal Sources, and choose the Source that you want to use from the list. The controls for adding sources to the list are shown at the top of the screen, the list of available sources in the middle of the screen, and the currently selected source at the bottom of the screen.

The sources in the Available Source List are as follows:

– Any internal sources that are installed and licensed

NOTE **Only one internal source can be installed, displayed at address “INTERNAL”**

– Any external sources that you have previously configured, whether or not they are currently connected, displayed with their VISA address

The list of available sources includes any sources that you have previously used (unless you have deleted them) and any found using the “Add Source to List” controls.

Double-tap the source you want to use, or use the up and down arrows to move to the source that you want and press Select Highlighted Source” or “Enter”. The source you have selected shows up at the bottom of the screen as the “Selected Source”. Press “Verify Connection” to make sure that the interface connection to the Source is functional.

At any time, you may use the “Add Source to List” controls to find new sources or “Delete Highlighted Source” to remove a source from the list of available sources.

Note that only external sources that are supported by the Tracking Source Mode are displayed in the Available Source List. Here are the Keysight/Agilent sources currently supported:

Source	UXA	PXA	MXA	EXA	CXA	MXE (Presel off)
MXG N5161A	X	X	X	X	X	X
MXG N5162A	X	X	X	X	X	X
EXG N5171B	X	X	X	X	X	X
EXG N5172B	X	X	X	X	X	X
EXG N5173B	X	X	X	X	X	X
MXG N5181A	X	X	X	X	X	X
MXG N5182A	X	X	X	X	X	X
MXG N5183A	X	X	X	X		X
MXG N5181B	X	X	X	X	X	X
MXG N5182B	X	X	X	X	X	X
MXG N5183B	X	X	X	X	X	X
PSG E8257C	X	X	X	X		
PSG E8257D	X	X	X	X		
PSG E8257N	X	X	X	X		
PSG E8267C	X	X	X	X		
PSG E8267D	X	X	X	X		

Add Installed USB Source

Sources on USB (once installed) can be added to the list by pressing **Add Installed USB Sources**. Any supported source found is added to the list.

Press this control to add USB sources to the Available Source List. Note that this function will *only* find sources that have previously been installed onto the USB. For information on how to install a USB source, see "Installing a USB source" on page 473

Notes	If no installed USB device is found which is a supported source, an error message is generated

Installing a USB source

USB is the only interface that requires no runtime action by the user in the Select Source menu, but does require “installation” when a source is plugged in.

You start by connecting the USB source to the instrument. You will see a series of messages indicating that the instrument is installing required device software.

When the installation is complete, you will see a message to that effect. You can then use **Add Installed USB Sources** (above) to add the source to the list of sources in the Available Source List.

GPIB Address

Lets you enter the GPIB address of a GPIB source. After you enter the address press **Add Specified GPIB Address** to add the source at that address to the Available Source List.

NOTE **For the GPIB interface to work properly when controlling a Source, it must be configured as a Controller. You can find this setting in the System menu under System, I/O Config, GPIB. Set the GPIB Controller function to Enabled.**

Preset	Unaffected by Mode Preset but set to 19 by **Restore Input/Output Defaults**
State Saved	No
Min	0
Max	30

Add Specified GPIB Address

Add the source at the entered GPIB address to the Available Source List. If a supported source is found at that address, it is added to the list.

Notes	If GPIB controller mode is not enabled, an error message is generated If no supported source is found at the specified address, an error message is generated

Scan & Add GPIB Source

Sources on GPIB can be added by pressing **Scan & Add GPIB Source**. Any supported source found is added to the Available Source List.

NOTE	This will cause any older, non-SCPI compatible devices on your GPIB to generate error messages.

Notes	If the GPIB controller mode is not enabled, an error message is generated If no GPIB device is found which is a supported source, an error message is generated

IP Address

Lets you enter the IP address of a source om the LAN. After you enter the address, press **Add** to add the source at that address to the Available Source List.

Preset	Unaffected by Mode Preset but set to 0.0.0.0 by **Restore Input/Output Defaults**
State Saved	No

Add Specified IP Address

Adds the source at the entered IP address to the Available Source List. If a supported source is found at that address, it is added to the list.

Notes	If no supported source is found at the specified address, an error message is generated

Run Connection Expert...

The LAN cannot be scanned directly from the instrument software, but if you want to discover sources on the LAN, you can open Keysight Connection Expert by pressing **Run Connection Expert...**. You can import the list of currently configured devices from Keysight Connection Expert by pressing **Add From Connection Expert**.

The Connection Expert list depends on which instruments have been discovered by the Keysight Connection Expert application. Any connected, supported sources in that list is added.

Add From Connection Expert

You can import the list of currently configured devices from Keysight Connection Expert by pressing **Add From Connection Expert**. The Connection Expert list depends on which instruments have already been discovered by the Keysight Connection Expert application. Any connected, supported sources in that list is added.

Notes	If no supported source is found in the Connection Expert list, an error message is generated

Select Highlighted Source

You can navigate up and down in the list with the up and down arrow keys, and select any entry by pressing **Select Highlighted Source** (or by double-tapping on the entry in the table). The highlighted source becomes the Current Source and is prominently displayed at the bottom of the screen.

At any given time, there is only one selected Source for the entire system; once a Source is selected, it becomes the Current Source and will be used by all applications that support Source Control.

For example, if no Source has yet been selected, the statement at the bottom of the screen would say

`Selected Source`

`None`

If an N5182A connected via USB were the Current Source, the statement at the bottom of the screen might say:

`Selected Source`

`Keysight N5182A US00000258 at USB0::2931::7937::US00000258::0::INSTR`

The command defined below allows the programmatic user to directly define the VISA address via a string parameter. The parameter is checked for proper syntax, the connection to the instrument is verified, and the source is added to the Available Source List if it verifies. If it does not verify or no source is found at that address, an error message is generated.

Normally the source selection activities should be performed only when the user changes the hardware connection configuration or activates/deactivates a source option license; shutdown and startup of the application will not cause source re-selection.

The Keysight IO Libraries Suite provides a “Keysight VISA Help” document that has a section that shows the proper syntax for valid VISA address strings, in the `ViOpen` function definition.

Remote Command	`:SYSTem:COMMunicate:SOURce[1]:ADDRess <address string>` `:SYSTem:COMMunicate:SOURce[1]:ADDRess?`

Example	Different examples for setting external source address
	`:SYST:COMM:SOUR:ADDR “TCPIP0::MyHostName::INSTR”`
	`:SYST:COMM:SOUR:ADDR “TCPIP0::123.121.100.210::INSTR”`

	`:SYST:COMM:SOUR:ADDR “USB0::12212::32145::US1234567A::INSTR”` `:SYST:COMM:SOUR:ADDR “GPIB1::19::INSTR”`
Notes	Empty string is allowed and means no source is defined or selected The address string is the VISA address for external sources and “`INTERNAL`” for an internal source
Dependencies	Operation with a source requires a license. If the proper license is not installed, the command generates an error message, “Settings conflict; option not installed” If no supported source, or no source at all, is found at the specified address, the command generates an error message
Preset	The current source selection is unaffected by Mode Preset and Source Preset but reverts to [None] on Restore Input/Output Defaults If an internal Tracking Generator is installed, then instead of None, the default selection is `INTERNAL`
State Saved	Selected Source is saved Power On Persistent (survives power cycle) Part of the Input/Output system, which means it is Loaded and Saved with state
Backwards Compatibility SCPI	`:SYSTem:COMMunicate:LAN:SOURce[:EXTernal]:IP <address string>` `:SYSTem:COMMunicate:LAN:SOURce[:EXTernal]:IP?`

Backwards Compatibility Notes	Provided for compatibility with PSA Option 215. The address string is reformatted for the X-Series. For example, if the user sends
	`:SYSTem:COMMunicate:LAN:SOURce:EXTernal:IP 146.208.172.111`
	The instrument turns this into
	`:SYSTem:COMMunicate:SOURce:ADDRess “TCPIP0::146.208.172.111::INSTR"`

Delete Highlighted Source

Deletes the highlighted source from the list of available sources. You are prompted with a dialog box to make sure you *really* want to do this. The prompt says:

“The highlighted source will be permanently deleted from the list. Are you sure you want to do this? Press Enter to proceed, or Cancel (ESC) to cancel”

Verify Connection

This control verifies the interface connection to the Current Source (it does *not* verify any signal connections!)

Until the selected source is verified, a statement appears at the bottom of the screen which says (in red):

This Source has not been verified. Press “Verify Source” to check the interface connection.

When you press this key, the connection is checked to the selected source. If all is well, the statement is changed to (in green):

This connection to this source has been verified.

If the verification fails, the statement at the bottom will change to (in red):

Verification of this source failed. Check the interface connection

The selected source is also verified whenever it is acquired. If a Source's connection has been verified by any means, then that Source is considered to have been verified until either the instrument software is shut down or if, in attempting to use the Source, communication with it fails.

Show Source

Shows the capabilities of the currently selected Source. The menu is useful for displaying source capabilities such as frequency and amplitude ranges.

Dependencies	If no source is selected this control is grayed-out

Source Preset

Forces all the settings in the instrument's Source State to their preset condition.

The Source State is the set of Source settings that is maintained and remembered by the instrument for use in the Tracking Source Mode. The Source State variables are controlled and set in the menus under the Source front panel key. These settings include:

- RF Output Off
- Amplitude = – 10 dBm
- Amplitude Step = Auto
- Power Sweep = 0 dB
- Amplitude Offset = 0 dB
- Source Sweep Reverse = Off
- Multiplier Numerator = 1
- Multiplier Denominator = 1
- Freq Offset = 0 Hz
- Point trigger is set to "Ext1"

The Source State is saved along with the state of the current Mode when you save a State, and is recalled when that Mode State is recalled. When the instrument first starts up, a Source Preset is performed. In the Input/Output menu, Restore Input/Output Defaults will also perform a Source Preset.

A Mode Preset, from modes that support the External Source, will turn the RF Off but will *not* perform a Source Preset. By the same token, Source Preset does *not* perform a Mode Preset.

Source Preset does *not* change the Source Mode nor the selection of which physical source is being used, nor does it release the current source (the source remains under the control of the instrument) nor exit the Source menu.

Remote Command	`:SOURce:PRESet`
Example	`:SOUR:PRES`
Preset	Initiates a Source Preset
State Saved	No

Source Setting Query (Remote Query Only)

This query returns certain settings from the Source when the Source Mode is set to Tracking. The returned values are all in ASCII text format.

Remote Command	`:SOURce:SETtings?`
Example	`:SOUR:SET?`
Notes	Returns a set of comma-separated values as follows (no spaces): `source max frequency,source min frequency,source frequency resolution,source max amplitude,source min amplitude,source amplitude resolution,source sweep max point,source start frequency,source stop frequency,source start amplitude,source stop amplitude`

3.2.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.2.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span when "Sweep Type" on page 490 is `SWEpt`, displays the sweep time in swept measurements, and displays the equivalent sweep time when **Sweep Type** is `FFT`.

NOTE **In instruments without sweeping hardware, such as some modular instruments, this control may be labelled "Acquisition Time"**

When **Sweep Time** is Auto, the instrument computes a time that will give accurate measurements based on other settings of the instrument, such as RBW and VBW.

You can choose a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the Meas Uncal indicator will come on if the sweep time you set is less than the calculated Auto Sweep time. You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters. The number of measurement points can also be reduced to speed the measurement (at the expense of frequency resolution).

You might need to specify a specific sweep speed to accommodate a specific condition in your transmitter. For example, you may have a burst signal and need to measure an exact portion of the burst.

When in Zero Span, there is no "Auto Sweep Time", so the Auto/Man toggle on this control disappears.

When Sweep Type is `FFT`, you cannot control the sweep time, it is simply reported by the instrument to give you an idea of how long the measurement is taking. The Auto/Man toggle therefore disappears when in an `FFT` sweep. In this case the **Sweep Time** function is grayed-out.

NOTE In VXT Models M9410A/11A/15A, **Sweep Type** is *always* set to `FFT`, as these models do not have sweeping hardware. Therefore, in VXT Models M9410A/11A/15A, the **Sweep Time** control is *always* grayed-out unless you are in Zero Span. The value reported on the control is the approximate time that will be taken to acquire the trace data for one measurement cycle. This is basically the acquisition time for each frequency segment ("chunk") multiplied by the number of segments. The "chunk" time is determined by other parameters, such as RBW and VBW. The value displayed represents, as close as can be estimated, the time to "take one sweep".

When the control is grayed-out, sending the **Sweep Time** SCPI command generates an error.

If you need a longer total acquisition time than that represented by the **Sweep Time** readout in VXT Models M9410A/11A/15A, use the "Minimum Acquisition Time" on page 482 control.

Note that although some overhead time is required by the instrument to complete a sweep cycle, the sweep time reported when Sweep Type is `SWEpt` does not include the overhead time, just the time to sweep the LO over the current Span. When Sweep Type is `FFT`, however, the reported Sweep Time takes into account both the data acquisition time and the processing time, in order to report an equivalent Sweep Time for a meaningful comparison to the Swept case.

NOTE	Significantly faster sweep times are available for the Swept SA measurement with Option FS1.

NOTE	The Meas Uncal (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual **Sweep Time** entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will give accurate measurements; if you sweep faster than this your measurements may be inaccurate. A Meas Uncal condition may be corrected by returning **Sweep Time** to Auto; by entering a longer **Sweep Time**; or by choosing a wider RBW and/or VBW. On occasion, other factors such as the Tracking Generator's maximum sweep rate, the YTF sweep rate (in high band) or the LO's capability (in low band) can cause a Meas Uncal condition. The most reliable way to correct this is to return **Sweep Time** to Auto. If the instrument calculates that the Auto Sweep Time would be greater than 4000s (which is beyond its range), the warning message "Settings Alert; Sweep Rate Unavailable" is displayed. In this case increase the RBW or reduce the span. If the instrument's estimated sweep time in an `FFT` sweep is greater than 4000s, the warning message "Settings Alert; Span : RBW Ratio too big" is displayed. In this case reduce the span or increase the RBW and/or FFT Width.

NOTE	When using a Tracking Source (**Source**, **Source Mode** set to "**Tracking**"), the sweep time shown includes an estimate of the source's settling time. This estimate may contain inaccuracies, particularly when software triggering is used for the source. This can result in the reported sweep time being shorter than the actual sweep time.

Remote Command	`[:SENSe]:SWEep:TIME <time>`

	`[:SENSe]:SWEep:TIME?`
Example	`:SWE:TIME 500 ms` `:SWE:TIME?`
Notes	The values shown in this table reflect the "swept spans" conditions, which are the default settings after a preset. See "Couplings" for values in the zero-span domain
Dependencies	The Auto/Man toggle disappears in Zero Span. Sending `:SWEep:TIME:AUTO ON` in Zero Span generates an error message In `FFT` sweeps, the Sweep Time control is grayed-out. Pressing the control or sending the SCPI for sweep time while the instrument is in FFT sweep generates a -221, "Settings Conflict;" error In certain instruments without sweeping hardware, such as VXT and UXM, the Auto/Man toggle disappears, and the **Sweep Time** control is grayed-out Sending `:SWEep:TIME:AUTO ON` in `FFT` sweeps generates an error Grayed-out while in Gate View, to avoid confusion with GATE VIEW Sweep Time Grayed-out in Measurements that do not support `SWEpt` mode Not displayed in Modes that do not support `SWEpt` mode Set to **Auto** when "Auto Couple" on page 1995 is pressed or sent remotely
Couplings	Coupled to RBW when in a non-zero span. If **Sweep Time** is set to Auto, then the sweep time is changed as the RBW changes, to maintain amplitude calibration Also coupled to Video Bandwidth (VBW). As the VBW is changed, the sweep time (when set to Auto) is changed to maintain amplitude calibration. This occurs because of common hardware between the two circuits Although the VBW filter is not "in-circuit" when using the average detector and the EMI detectors, the Video BW control can have an effect on (Auto) sweep time in these cases, and is not disabled. Because the purpose of the average detector and the VBW filter are the same, either can be used to reduce the variance of the result. In this case, reducing the VBW setting increases the sweep time, which increases the averaging time, producing a lower-variance trace Span, Center Frequency, and the number of sweep points also can have an effect, so changing these parameters may change the Sweep Time The Sweep Time used upon entry to Zero Span is the same as the Sweep Time that was in effect before entering Zero Span. The Sweep Time can be changed while in Zero Span. Upon leaving Zero Span, the Auto/Man state of Sweep Time that existed before entering Zero Span is restored If **Sweep Time** was in **Auto** before entering Zero Span, or if it is set to **Auto** while in **Zero Span** (which can happen via remote command or if "Auto Couple" on page 1995 is pressed) it returns to **Auto** and recouples when returning to non-zero spans If **Sweep Time** was in **Man** before entering **Zero Span**, it returns to **Man** when returning to non-zero spans, and any changes to Sweep Time that were made while in **Zero Span** are retained in the non-zero span (except where constrained by minimum limits, which are different in and out of zero span)
Preset	Auto
State Saved	Saved in instrument state
Min	In zero span: 1 ms In swept spans: 1 ms In Stepped Tracking (as with option ESC): same as auto sweep time

	In Swept Tracking, with Tracking Generator option T03 or T06, the minimum sweep time is 1 ms, but the Meas Uncal indicator is turned on for sweep times faster than 50 ms
Max	Zero span: 6000 s Swept spans: 4000 s In VXT: depends on current settings in Swept spans
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) If in an FFT sweep, the word (FFT) is added in parentheses and a ~ is used to indicate “approximate”, as Sweep (FFT) ~13 ms (1001 points) A “#” mark appears before “Sweep” in the annotation when it is switched from Auto to Manual coupling. Note that this # does NOT appear when in zero span, as there is neither an autocoupled nor a manual state in zero span; there is no coupling at all
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register `STATus:QUEStionable:INTegrity:UNCalibrated`

Auto Function

Remote Command	`[:SENSe]:SWEep:TIME:AUTO OFF | ON | 0 | 1` `[:SENSe]:SWEep:TIME:AUTO?`
Example	`:SWE:TIME:AUTO OFF` `:SWE:TIME:AUTO?`
Preset	`ON`

Minimum Acquisition Time

Sets the minimum time to be used to acquire each frequency segment (“chunk”) in an FFT sweep. In Auto, it simply uses the value driven by "Sweep Time" on page 479. You can use this control to increase the total acquisition time to the value you need in order to acquire all of the data for your particular measurement.

This control is provided in VXT Models M9410A/11A/15A to give you control over the acquisition time, because **Sweep Time** is not available in these models, as they always use FFT sweeps.

In manual, if set to a value greater than Sweep Time/number of chunks, the instrument acquires more than the minimum amount of data and averages multiple FFTs.

Note that if set to manual, the acquisition time may *exceed* the minimum in order to do an integral number of FFTs.

Remote Command	`[:SENSe]:SWEep:ACQuisition:TIME <time>`

	[:SENSe]:SWEep:ACQuisition:TIME?
Example	:SWE:ACQ:TIME 500 ms :SWE:ACQ:TIME?
Dependencies	Only available in certain modular instruments such as VXT Models M9410A/11A Grayed-out in Zero Span. Grayout error: "-121, Settings conflict; Zero Span, Min Acq Time unavailable"
Preset	Auto
State Saved	Saved in instrument state

Auto Function

Remote Command	[:SENSe]:SWEep:ACQuisition:TIME:AUTO OFF | ON | 0 | 1 [:SENSe]:SWEep:ACQuisition:TIME:AUTO?
Example	:SWE:ACQ:TIME:AUTO OFF
Preset	ON

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "More Information" on page 484

Remote Command	:INITiate:CONTinuous OFF | ON | 0 | 1 :INITiate:CONTinuous?
Example	Put instrument into **Single** measurement operation: :INIT:CONT 0 :INIT:CONT OFF Put instrument into **Continuous** measurement operation: :INIT:CONT 1 :INIT:CONT ON
Preset	ON Note that :SYST:PRES sets :INIT:CONT to ON, but *RST sets :INIT:CONT to OFF
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is **Single** – A loop with an arrow is **Continuous**
Backwards	X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-

Compatibility Notes	Series A-models, if in single measurement, the **Cont** hardkey (and `INIT:CONT ON`) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument keeps sweeping See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**
Single Mode	The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- `:INIT:CONT 1` has no effect
- `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state

See "Restart" on page 2018 for details of `:INIT:IMMediate`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Sweep Time Annotation

Lets you specify whether you want to see, for Sweep Time, an estimate of the total time the instrument is taking to make a sweep, or 1/(Sweep Rate) as has traditionally been the case.

In previous instruments, Sweep Time has always been displayed, when taking a sweep by the swept method (as opposed to the FFT method), as 1/(Sweep Rate), even though that may be shorter than the time it actually takes to perform a sweep. This value of 1/(Sweep Rate) is an excellent indication of how fast the local oscillator is moving, and the experienced user can infer much from this quantity about the optimal value of other settings, like Res BW.

However, 1/(Sweep Rate) can be much less than the total time it takes the instrument to do a multi-band sweep over a wide frequency range, due to band switching and settling times that may add to the total sweep time.

Because of this, you are now given the option of which value the instrument will display. The Sweep Time Annotation gives you two choices, `NORMal` and `ESTimated`. If you prefer the traditional method (that is, always display 1(sweep rate)), choose Normal (1/Sweep Rate). If instead you choose “Estimated”, the estimated actual sweep time is displayed, which is the time from start to finish of a sweep, as well as it can be estimated. This is displayed in the Sweep Time annotation area and is still called “Sweep Time”, as always. To show you that this is the estimated actual sweep time instead of 1/(Sweep Rate), it is preceded by a tilde (~), so it will look like this (for example):

Sweep ~5.3 s (1001 pts)

instead of

Sweep 440 ms (1001 pts)

Note that this value does *not* include the time *between* sweeps, so it not a measure of “cycle time”.

Note also that Estimated Sweep Time only applies when Sweep Type=Swept; when Sweep Type=FFT, the behavior remains as it always has for FFT sweeps, the display is (for example):

Sweep (FFT) ~1.2 s (1001 pts)

Sweep Time Annotation is an Auto/Man control. In Auto (the default state), Normal is chosen unless when unless there is a band crossing or software preselection is being performed, in which case Estimated is chosen.

The Sweep Time command and Sweep Time query set and return the traditional values; but if you want to query the estimated sweep time via SCPI, there is a new query that returns the estimated sweep time:

`[:SENSe]:SWEep:ETIMe?`

Remote Command	`[:SENSe]:SWEep:TIME:ANNotation NORMal:ESTimated` `[:SENSe]:SWEep:TIME:ANNotation?`
Example	`:SWE:TIME:ANN NORM` `:SWE:TIME:ANN?`
Couplings	If you manually choose a value, the Auto/Man selection will change to Manual. You can set it back to auto by tapping the Auto/Man switch
Preset	Auto
State Saved	Saved in instrument state
Annotation	If Estimated, Sweep Time displays as: Sweep ~5.3 s (1001 pts)

Auto Function

Remote Command	`[:SENSe]:SWEep:TIME:ANNotation:AUTO ON | OFF | 1 | 0` `[:SENSe]:SWEep:TIME:ANNotation:AUTO?`
Example	`:SWE:TIME:AUTO:ANN OFF`
Preset	`ON`

Zoom Sweep Time

Controls the sweep time in the bottom window of the Trace Zoom View (the Zoomed Trace window).

Zoom Sweep Time works very much the way Sweep Time works, but it only affects the sweep time of the Zoomed Trace window, whereas Sweep Time affects the Sweep Time of the Spectrum (top) window in Trace Zoom. Because the ratio of the Zoom Sweep Time to the Sweep Time affects the width of the blue bar in the Spectrum window, adjusting Zoom Sweep Time changes the width of the blue bar.

Adjusting the Zoom Sweep Time has no impact on Sweep Time; hence it has no impact on any parameter that might be coupled to Sweep Time and no impact on the measurement. It only affects the portion of the upper trace which is visible in the bottom window.

Remote Command	`[:SENSe]:SWEep:TZOom:TIME <time>` `[:SENSe]:SWEep:TZO:TIME?`

Example	`:SWE:TZO:TIME 500 ms`
Dependencies	Only appears if the Zoomed Trace window is present
Preset	10% of Sweep Time
State Saved	Saved in instrument state
Min	10% of minimum Sweep Time
Max	Maximum Sweep Time
Annotation	The zoom sweep time is displayed in the lower-right corner of the bottom window. The number of points is displayed parenthetically, as Zoom Sweep 13.3 ms (101 points) If in an FFT sweep, the word (FFT) is added in parentheses and a ~ is used to indicate “approximate”, as Zoom Sweep (FFT) ~13 ms (101 points) A “#” mark appears before “Zoom Sweep” in the annotation when Sweep Time is switched from Auto to Manual coupling. Note that this # does *not* appear when in zero span, as there is neither an autocoupled nor a manual state in zero span; there is no coupling at all

Zoom Center

Allows you to change the center of the zoom region, and hence of the lower window, without changing the Zoom Span, when you are in Zero Span.

The **Zoom Center** value is displayed in the lower left corner of the zoom window (below the graticule).

Remote Command	`[:SENSe]:FREQuency:TZOom:TIME:CENTer <time>` `[:SENSe]:FREQuency:TZOom:TIME:CENTer?`
Example	`:FREQ:TZO:TIME:CENT 500 ms`
Dependencies	Only appears if the Zoomed Trace window is present Grayed-out unless in Zero Span. If the command is sent when not in Zero Span, an error is reported
Couplings	The center of the lower window is limited by the Sweep Time in the upper window. You cannot move the zoom region out of the upper window, nor does changing the Zoom Center ever change the Zoom Sweep Time. When Zoom Center increases or decreases to a value that causes the zoom region to touch an edge of the top window, the Zoom Center is clipped at that value
Preset	50% of Sweep Time
State Saved	Saved in instrument state
Min	50% of Zoom Sweep Time
Max	Sweep Time - 50% of Zoom Sweep Time
Annotation	Lower left corner of the Zoomed Trace window

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

– Pressing the **Restart** key

– Sending `:INIT:IMM`

– Sending `:INIT:REST`

See "More Information" on page 488

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **MaxHold** and **MinHold** traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue

Event	Trace Effect
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is `k`. This `k` is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This `k` is used for comparisons with N, as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, `K`, shows the count for the sweep (data acquisition) in progress. `K` = `k` + 1, with a limit of N. The displayed value `K` changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

3.2.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Type

Selects `FFT` or `SWEpt` types.

Sweep Type refers to whether or not the instrument is in **Swept** or **FFT** analysis. When in **Auto**, the selection of **Sweep Type** is governed by two different sets of rules, depending on whether you want to optimize for dynamic range or for speed.

FFT “sweeps” should not be used when making EMI measurements; therefore, when a CISPR detector (Quasi Peak, EMI Average, RMS Average) is selected for any active trace (one for which **Update** is on), the **FFT** option in the **Sweep Type** menu is grayed-out, and the Auto Rules only select **Swept**. If **Sweep Type** is manually selected as **FFT**, the CISPR detectors are all grayed-out.

FFT sweeps are never auto-selected when Screen Video, Log Video or Linear Video are the selected Analog Output.

Value	SCPI	Notes
Auto	AUTO = ON	When in **Auto**, the selection of sweep type is governed by two different sets of rules, depending on whether you want to optimize for dynamic range or for speed. See "Sweep Type Rules" on page 492
FFT	`FFT`	Manually selects FFT analysis, so it cannot change automatically to **Swept**
Swept	`SWEep`	Manually selects swept analysis, so it cannot change automatically to **FFT** Selected automatically if any of the CISPR detectors is specified for any active trace, in which case the **FFT** Sweep Type selection is also grayed-out

Remote Command	`[:SENSe]:SWEep:TYPE FFT | SWEep` `[:SENSe]:SWEep:TYPE?`
Example	`:SWE:TYPE FFT` `:SWE:TYPE?`
Dependencies	Grayed-out in **Zero Span**, but the setting can be changed remotely with no error indication Does not appear in certain instruments without sweeping hardware, such as VXT Grayed-out or not displayed in measurements that do not support swept mode When Gate is ON, Gate Method selection affects **Sweep Type** availability: – When Gate Method is FFT, **Swept** grayed-out and rules choose FFT – When Gate Method is Video or LO, **FFT** grayed-out and rules choose Swept **Swept** is grayed-out while in Gated FFT (meaning Gate is ON and Gate Method is FFT) When a CISPR detector (Quasi Peak, EMI Average, RMS Average) is selected for any active trace, the **FFT** selection is grayed-out When the RF Preselector is on, the **FFT** selection is grayed-out When **Source Mode** is set to **Tracking**, the **FFT** selection is grayed-out When **Signal ID** is on, Manual **FFT** is grayed-out While in Gated LO (meaning Gate is ON and Gate Method is LO), the **FFT** selection is grayed-out While in Gated Video (meaning Gate is ON and Gate Method is Video), the **FFT** selection is grayed-out
Preset	AUTO = ON
Annotation	The indication of sweep time includes a #Swp to indicate manual selection, as: Sweep (#Swp) 13.33 ms (1001 points) The indication of sweep time includes parenthetical notes to indicate sweep type unless in Auto, Swept, as: Auto, Swept — Sweep 13.33 ms (1001 points)

	<table><tr><td>Manual, Swept</td><td>Sweep (#Swp) 13.33 ms (1001 points)</td></tr><tr><td>Auto, FFT</td><td>Sweep (FFT) ~13 ms (1001 points)</td></tr><tr><td>Manual, FFT</td><td>Sweep (#FFT) ~13 ms (1001 points)</td></tr></table> The indication of (FFT) includes a # to indicate manual selection, as: Sweep (#FFT) ~13 ms (1001 points)

Backwards Compatibility Notes	Two additional parameters, `AUTO` and `SWP`, are supported for backwards compatibility only and should not be used for new designs
	`[:SENSe]:SWEep:TYPE AUTO`
	sets sweep type Auto to `ON` but the query returns either `FFT` or `SWE` depending on the auto setting
	`[:SENSe]:SWEep:TYPE SWP`
	selects sweep type Swept but returns `SWE` to a query

Auto Function

Remote Command	`[:SENSe]:SWEep:TYPE:AUTO OFF | ON | 0 | 1` `[:SENSe]:SWEep:TYPE:AUTO?`
Example	`:SWE:TYPE:AUTO ON` `:SWE:TYPE:AUTO?`
Couplings	Pressing "Auto Couple" on page 1995 always sets **Sweep Type** to **Auto** **Swept** is always selected whenever any form of **Signal ID** is on, or **Source Mode** is set to **Tracking**, or any EMI detector is selected, or the RF Preselector is `ON`
Preset	`ON`

Sweep Type Rules

Specifies which set of rules to use for automatically selecting **Sweep Type** when "Sweep Type" on page 490 is in **Auto**.

Value	SCPI	Notes
Auto	`AUTO` = `ON`	When in **Auto**, **Sweep Type Rules** are set to `DRANge`
Best Dynamic Range	`DRANge`	Choose between **Swept** and **FFT** analysis with the primary goal of optimizing dynamic range. If the dynamic range is very close between **Swept** and **FFT**, then choose the faster one. This auto selection also depends on RBW Type
Best Speed	`SPEed`	Choose between **FFT** or **Swept** analysis based on the fastest instrument speed

Remote Command	`[:SENSe]:SWEep:TYPE:AUTO:RULes SPEed | DRANge` `[:SENSe]:SWEep:TYPE:AUTO:RULes?`
Example	`:SWE:TYPE:AUTO:RUL SPE` `:SWE:TYPE:AUTO:RUL?`
Dependencies	Grayed-out in **Zero Span**, however, the setting can be changed remotely with no error indication

	Does not appear in certain instruments without sweeping hardware, such as VXT
Preset	DRANge
State Saved	Saved in instrument state

Auto Function

Remote Command	[:SENSe]:SWEep:TYPE:AUTO:RULes:AUTO[:STATe] OFF | ON | 0 | 1 [:SENSe]:SWEep:TYPE:AUTO:RULes:AUTO[:STATe]?
Example	:SWE:TYPE:AUTO:RUL:AUTO ON :SWE:TYPE:AUTO:RUL:AUTO?
Couplings	Pressing "Auto Couple" on page 1995 always sets **Sweep Type Rules** to **Auto**
Preset	ON

In determining the **Swept** or **FFT** setting, the auto rules use the following approach:

- If the RBW Filter Type is Gaussian, use the RBW for the Normal Filter BW and if that RBW > 210 Hz, use **Swept**; for RBW <= 210 Hz, use **FFT**
- If the RBW Filter Type is Flat Top, use the same algorithm, but use 420 Hz instead of 210 Hz for the transition point between **Swept** and **FFT**
- If any of the CISPR detectors is selected for any active trace, always use **Swept**

Sweep Time Rules

Allows you to select one of three sets of sweep time rules. These rules are used to set the sweep time when **Sweep Time** is in **Auto** mode. Note that these rules only apply when "Sweep Type" on page 490 is **Swept** (either manually or automatically chosen) and not when in **FFT** sweeps.

If any selection is manually chosen, the **Auto/Man** toggle is set to **Man**.

Remote Command	[:SENSe]:SWEep:TIME:AUTO:RULes NORMal | ACCuracy | SRESponse For options, see "Option Details" on page 494 [:SENSe]:SWEep:TIME:AUTO:RULes?
Example	:SWE:TIME:AUTO:RUL ACC :SWE:TIME:AUTO:RUL?
Dependencies	SA - Normal and SA – Accuracy are not available (grayed-out) when Source Mode=Tracking Grayed-out in **Zero Span**, however, the setting can be changed remotely with no error indication Grayed-out in **FFT** sweeps. Pressing this selection while the instrument is in **FFT** sweep generates an advisory message. The SCPI is acted upon if sent, but has no effect other than to change the readout on the control, as long as the instrument is in an **FFT** sweep Does not appear in certain instruments without sweeping hardware, such as VXT
Couplings	Set to **Auto** by "Auto Couple" on page 1995

	Stimulus / Response is automatically selected when the Source is on (**Source Mode** not set to OFF)
Preset	AUTO
State Saved	Saved in instrument state
Backwards Compatibility SCPI	:SWEep:TIME:AUTO:MODE SRESponse | SANalyzer :SWEep:TIME:AUTO:MODE?
Backwards Compatibility Notes	:SWEep:TIME:AUTO:MODE SANalyzer is aliased to :SWEep:TIME:AUTO:RULes NORMal :SWEep:TIME:AUTO:MODE SRESponse is aliased to :SWEep:TIME:AUTO:RULes SRESponse The query is aliased to :SWEep:TIME:RULes?, so it matches for SRESponse but not for SANalyzer The old Auto Sweep Time command was the same: [:SENSe]:SWEep:TIME:AUTO:RULes NORMal | ACCuracy so, it still works although it now has a third parameter (SRESponse)

Auto Function

Remote Command	[:SENSe]:SWEep:TIME:AUTO:RULes:AUTO[:STATe] ON | OFF | 1 | 0 [:SENSe]:SWEep:TIME:AUTO:RULes:AUTO[:STATe]?
Example	:SWE:TIME:AUTO:RUL:AUTO ON :SWE:TIME:AUTO:RUL:AUTO?
Couplings	Set on Preset or by "Auto Couple" on page 1995
Preset	ON

Option Details

Value	SCPI	Notes
Auto	AUTO = ON	When in **Auto**, the Sweep Time Rules are set to SA-Normal
SA - Normal	NORMal	This selection selects auto rules for optimal speed and generally sufficient accuracy
SA - Accuracy	ACCuracy	This selection selects auto rules for specified absolute amplitude accuracy
Stimulus / Response	SRESponse	This selection selects auto rules for the case where the instrument is sweeping in concert with a source Automatically selected when the Source is on (Source Mode not set to OFF)

Sweep Time Rules is set to **SA-Normal** on a **Preset** or **Auto Couple**. These rules give optimal sweep times at a loss of accuracy. Note that this means that in the Preset or Auto Coupled state, instrument amplitude accuracy specifications do not apply.

Setting **Sweep Time Rules** to **SA-Accuracy** results in slower sweep times than **SA-Normal**, usually about three times as long, but with better amplitude accuracy for

CW signals. The instrument absolute amplitude accuracy specifications only apply when **Sweep Time** is set to **Auto**, and **Sweep Time Rules** are set to **SA-Accuracy**. Additional amplitude errors, which occur when **Sweep Time Rules** are set to **SA-Normal**, are usually well under 0.1 dB with non-EMI detectors (though this is not guaranteed). With EMI detectors (Quasi Peak, EMI Average and RMS Average), the errors are usually well under 0.5 dB. For best accuracy when using EMI detectors, zero span is the preferred measurement technique; for the EMI detectors, zero span measurements will not fully agree with swept measurements except at extremely slow sweep rates (note that the meters in the N6141A are zero span measurements and therefore this statement also applies to the meters).

Because of the faster sweep times and still low errors, **SA-Normal** is the preferred setting of **Sweep Time Rules**.

The third set of rules, **Stimulus/Response**, is automatically selected when an integrated source is turned on, such as a Tracking Generator or a synchronized external source.

Note that there are two types of source-synchronized sweeping, one where the source sweeps (as with a built-in tracking generator) and one where the source steps. The former is usually much faster than even general-purpose sweeps because when sweeping along with a swept source the RBW and VBW filters do not directly interact with **Span**. However, sweeping in concert with a stepped source usually slows the sweep down because it is necessary to wait for the stepped source and the instrument to settle at each point. The instrument chooses one of these methods based on what kind of a source is connected or installed; it picks the former if there is no source in use, which means that by selecting **Stimulus/Response** rules manually when there is no source in use, you can achieve faster sweep times than **SA – Normal**.

Stimulus/Response auto-coupled sweep times are typically valid in stimulus-response measurements when the system's frequency span is less than 20 times the bandwidth of the device under test. As noted above you can select these rules manually (even if not making Stimulus-Response measurements), which will allow you to sweep faster before the "Meas Uncal" warning comes on, but you are then not protected from the over-sweep condition and may end up with uncalibrated results. However, it is commonplace in measuring non-CW signals such as noise to be able to get excellent measurement accuracy at sweep rates higher than those required for CW signal accuracy, so this is a valid measurement technique.

As always, when the X-series instrument is in **AutoSweep Time**, the sweep time is estimated and displayed in the **Sweep/Control** menu as well as in the annotation at the bottom of the displayed measurement. Since this can depend on variables outside the instrument's control, the actual sweep time may vary slightly from this estimate.

FFT Width

Displays and controls the width of the FFTs performed while in FFT mode. The **FFT Width** is the range of frequencies being looked at by the FFT, sometimes referred to as the "chunk width" – it is *not* the resolution bandwidth used when performing the FFT.

It is important to understand that this function does not directly set the FFT width, it sets the limit on the FFT Width. The actual FFT width used is determined by several other factors including the **Span** you have set. Usually, the instrument picks the optimal **FFT Width** based on the current setup; but on occasion you may wish to limit **FFT Width** to be narrower than that which the instrument would have set.

NOTE: This function does not allow you to widen **FFT Width** beyond that which the instrument might have set; it only allows you to narrow it. You might do this to improve the dynamic range of the measurement or eliminate nearby spurs from your measurement.

Note that the **FFT Width** setting has no effect unless in an **FFT** sweep.

See "More Information" on page 497

Remote Command	`[:SENSe]:SWEep:FFT:WIDTh <real>` `[:SENSe]:SWEep:FFT:WIDTh?`
Example	`:SWE:FFT:WIDT 167 kHz` sets this function to "<167.4 kHz"
Notes	The parameter is in units of frequency For values sent via SCPI, the instrument chooses the smallest value that is at least as great as the requested value Examples: – Parameter 3.99 kHz is sent via SCPI. Analyzer chooses ≤4.01 kHz – Parameter 4.02 kHz is sent via SCPI. Analyzer chooses ≤28.81 kHz – Parameter 8 MHz is sent via SCPI. Analyzer chooses 10 MHz
Dependencies	Does not appear in VXT models M9421A/10A/11A/15A In some models, the analog prefilters are not provided. In these models the **FFT Width** function is always in **Auto**. The **FFT Width** control is not displayed in these models, and the SCPI commands are accepted without error but have no effect Grayed-out in **Zero Span**, however, the setting can be changed remotely with no error indication
Couplings	**FFT Width** affects **ADC Dither**, "Meas Setup" on page 379 and the point at which the instrument switches from **Swept** to **FFT** acquisition
Preset	The Preset is **Auto**, but **Preset** will also pick **Best Dynamic Range** and this function is set to ~Maximum

State Saved	Saved in instrument state
Min	4.01 kHz
Max	Depends on the IF Bandwidth option. The maxim available width is: Standard, 10 MHz Option B25, 25 MHz Option B40, 40 MHz Option B2X, 255 MHz
Backwards Compatibility SCPI	`[:SENSe]:SWEep:FFT:SPAN:RATio <integer>` `[:SENSe]:SWEep:FFT:SPAN:RATio?`

Auto Function

Remote Command	`[:SENSe]:SWEep:FFT:WIDTh:AUTO OFF | ON | 0 | 1` `[:SENSe]:SWEep:FFT:WIDTh:AUTO?`
Example	`:SWE:FFT:WIDT:AUTO ON` `:SWE:FFT:WIDT:AUTO?`
Couplings	Pressing "Auto Couple" on page 1995 always sets **FFT Width** to **Auto**
Preset	ON

More Information

An FFT measurement can only be performed over a limited span known as the “FFT segment”. Several segments may need to be combined to measure the entire span. For advanced FFT control in X-Series, you have direct control over the segment width using the **FFT Width** control. Generally, in automatic operation, X-Series sets the segment width to be as wide as possible, as this results in the fastest measurements.

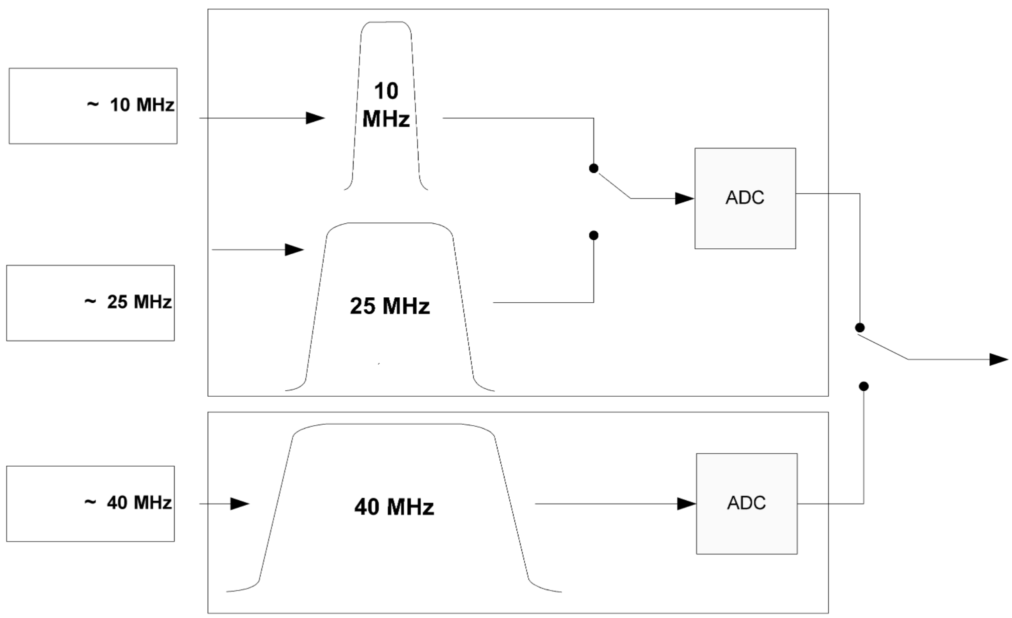
However, to increase the dynamic range, most X-series models provide a set of analog prefilters that precede the ADC. Unlike swept measurements, which pass the signal through a bandpass before the ADC, FFT measurements present the full signal bandwidth to the ADC, making them more susceptible to overload, and requiring a lower signal level. The prefilters act to alleviate this phenomenon - they allow the signal level at the ADC to be higher while still avoiding an ADC overload, by eliminating signal power outside the bandwidth of interest, which in turn improves dynamic range.

Although narrowing the segment width can allow higher dynamic ranges in some cases, this comes at the expense of losing some of the speed advantages of the FFT, because narrower segments require more acquisitions and proportionately more processing overhead.

However, the advantages of narrow segments can be significant. For example, in pulsed-RF measurements such as radar, it is often possible to make high dynamic range measurements with signal levels approaching the compression threshold of the instrument in swept spans (well over 0 dBm), while resolving the spectral components to levels below the maximum IF drive level (about –8 dBm at the input mixer). But FFT processing experiences overloads at the maximum IF drive level even if the RBW is small enough that no single spectral component exceeds the maximum IF drive level. If you reduce the width of an FFT, an analog filter is placed before the ADC that is about 1.3 times as wide as the FFT segment width. This spreads out the pulsed RF in time and reduces the maximum signal level seen by the ADC. Therefore, the input attenuation can be reduced, and the dynamic range increased without overloading the ADC.

Further improvement in dynamic range is possible by changing the **FFT IF Gain** (in the **Meas Setup** menu of many measurements). If the segments are reduced in width, **FFT IF Gain** can be set to **High**, improving dynamic range.

Depending on what IF Bandwidth option you have specified, there can be up to three different IF paths available in FFT sweeps, as seen in the diagram below:



The 10 MHz path is always used for **Swept** sweeps. It is always used for **FFT** sweeps as well, unless you specify ~25 MHz in which case the 25 MHz path is used for **FFT** sweeps, or ~40 MHz, in which case the 40 MHz path is used for **FFT** sweeps. Note that, although each of these control s picks the specified path, the instrument may choose an FFT width less than the full IF width to optimize speed, trading off acquisition time versus processing time.

If the 255 MHz IF (Option B2X) is installed, it may also be used for **FFT** sweeps, but only if you specify ~255 MHz for FFT Width.

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in **FFT** sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces is cleared and, if Sweep is in Cont, a new trace taken. If any trace is in average or hold, the averaging starts over. If Limit Lines are ON, the limit lines are updated.

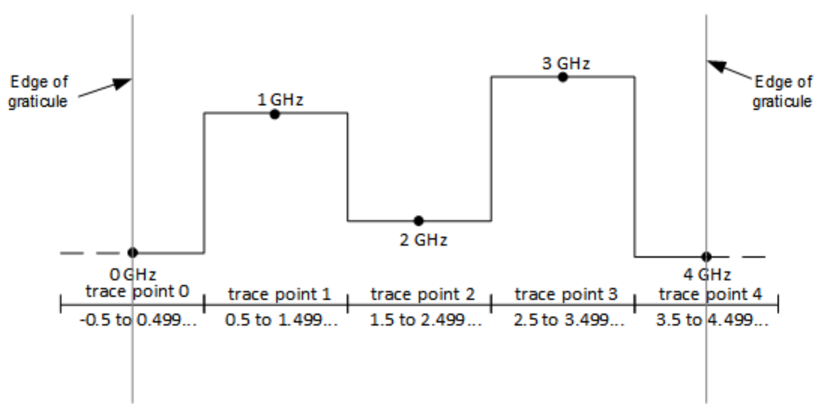
When in a split-screen display, each window may have its own value for points.

When sweep points is changed, an informational message is displayed, "Sweep points changed, all traces cleared."

Remote Command	`[:SENSe]:SWEep:POINts <integer>` `[:SENSe]:SWEep:POINts?`
Example	`:SWE:POIN 5001` `:SWE:POIN?`
Dependencies	Not available when **Signal ID** is ON in External Mixing Neither the knob nor the step keys can be used to change this value. If it is attempted, a warning is given Clipped to 1001 whenever you are in the **Spectrogram** View in all models except MXE, clipped to 20001 whenever you are in the **Spectrogram** View in MXE Grayed-out in measurements that do not support swept Not displayed in modes that do not support **Swept** Grayed-out if **Normalize** is ON; you cannot change the number of sweep points with **Normalize** on, as it will erase the reference trace
Couplings	When **Source Mode** is **Tracking**, and Stepped Tracking is used (as with Option ESC), 201 source steps are used to achieve optimal speed. The number of sweep points in the instrument is then set to match the number of steps in the source. When **Source Mode** is **Off**, the previous number of points (the value

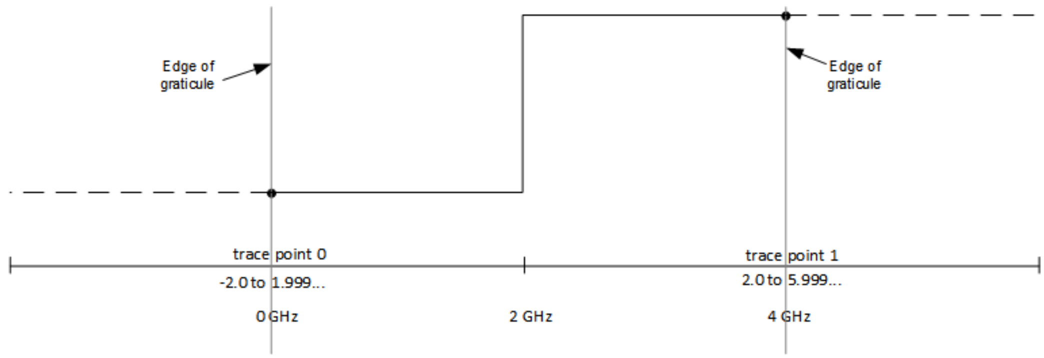
	that existed when **Source Mode** was **Off** previously) is restored, even if you have changed the **Points** value while **Source Mode** was set to **Tracking** Whenever the number of sweep points change: – All trace data is erased – Any traces with **Update** Off will also go to **Display** Off (like going from View to Blank in the older instruments) – Sweep time is re-quantized – Any Limit Lines that are on are updated – If averaging/hold is on, averaging/hold starts over The resolution of setting the sweep time depends on the number of points selected
Preset	1001
State Saved	Saved in instrument state
Min	Normally the minimum is 1, but in **TrackingSource Mode**, the minimum value of **Points** is 101. If you go into **TrackingSource Mode** with fewer points than 101, it sets **Points** to 101
Max	20001 all measurements unless noted below 100,001 when not in **Tracking Source Mode** In **Tracking Source Mode**: – in Stepped Tracking (for example, External Source), 1601 or the maximum number of points supported by the source, whichever is less – in Swept Tracking with the CXA TG, 10000 – in Stepped Tracking with the CXA-m TG, 16000
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

Traces are drawn by connecting the trace points, so below is what a 5-point trace with start frequency of 0 and stop frequency of 4 GHz would look like. Note that the black dots at the bucket centers are not actually drawn, but are for illustrative purposes only.



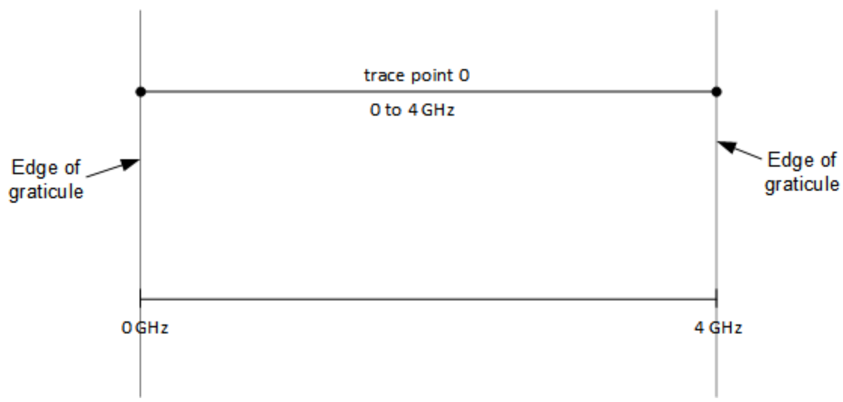
The first bucket (for measurement purposes) actually begins at start – (span/2 (sweep_points – 1)), and the last bucket extends to stop + (span/2(sweep_points – 1)). However, the first bucket is drawn starting at start, so only half the bucket is drawn, and the last bucket is drawn ending at stop, so only half of the last bucket is drawn.

The limiting case for which this applies is the two-bucket trace, which looks like this:



The one-bucket trace is a special case. The one-bucket trace extends from start to stop and is drawn from start to stop as shown below.

Note that the black dots at the bucket ends are not actually drawn, but are for illustrative purposes only.



Zoom Points

In the **Trace Zoom** View, the **Points** control changes to **Zoom Points** whenever the focus (thick blue border) is on the bottom window. **Zoom Points** controls how many points are displayed in the Zoom Window and hence indirectly controls the Zoom Span.

Remote Command	`[:SENSe]:SWEep:TZOom:POINts <integer>` `[:SENSe]:SWEep:TZOom:POINts?`

Example	`:SWE:TZO:POIN 5001` `:SWE:TZO:POIN?`
Dependencies	Only appears in the **Trace Zoom** View of the Swept SA measurement. If the command is sent in other Views, gives an error
Couplings	Coupled to **Zoom Span** and **Sweep Points**; if **Zoom Span** changes, **Zoom Points** changes but **Sweep Points** does not. If **Sweep Points** changes, **Zoom Points** changes but **Zoom Span** does not **Zoom Span** is directly coupled to **Zoom Points**. If **Zoom Points** changes, **Zoom Span** changes but **Sweep Points** does not
Preset	On entry to **Trace Zoom**, 10% of the number of points in the upper window
State Saved	Saved in instrument state
Min	1
Max	Number of points in top window
Annotation	On second line of annotations, in bottom window, in lower right corner in parenthesis behind the sweep annotation

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	`[:SENSe]:SWEep:IF:DITHer OFF | ON | 0 | 1` `[:SENSe]:SWEep:IF:DITHer?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`OFF`
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	`[:SENSe]:SWEep:IMAGeprot OFF | ON | 0 | 1` `[:SENSe]:SWEep:IMAGeprot?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`ON`
State Saved	Saved in instrument state

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If :`INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :`INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support this command
Status Bits/OPC dependencies	The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the Abort command will cause the `*OPC` query to return true

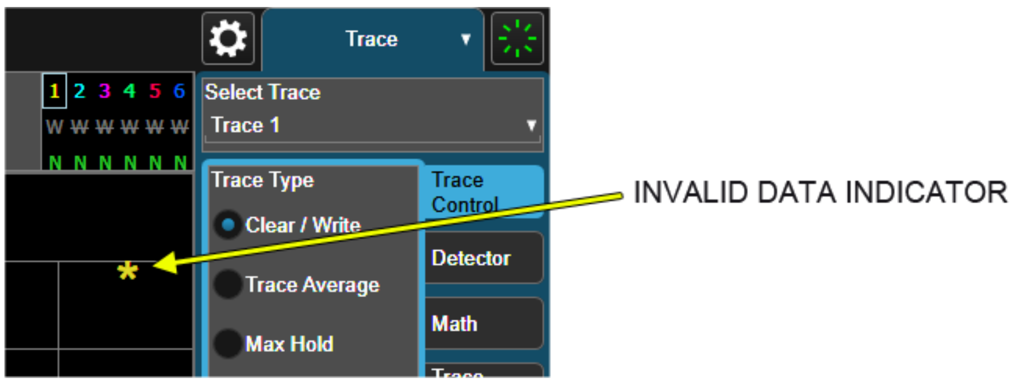
3.2.10 Trace

This menu lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

A trace is a series of data points, each having an x and a y value. The x value is frequency (or time, in zero span) and the y value is amplitude. Each data point is referred to as a trace point. In any given trace, trace point 0 is the first point, and trace point (sweep_points – 1) is the last. For example, in a 1001-point trace, the first point is 0 and the last is 1000. Another term sometimes used to describe traces is bucket. A bucket is the frequency span of a trace point, equal to the point spacing. For swept analysis, the y value in each bucket is measured while the instrument is sweeping across the bucket. How it is measured depends on which detector is selected.

When in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true on multiple screens. The marker and trace data are present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data is present until the next acquisition is completed.

Invalid Data Indicator



The invalid data indicator is displayed whenever the data on the display does not match the settings of the instrument. The most common example of this is when instrument settings have changed in the time since the data in the traces on the display was taken. This means that the screen annotation cannot be guaranteed to match the trace data. For example, if you change Center Frequency, the invalid data indicator will display until the trace has been retaken.

If any Trace is in View mode (displaying but not updating) and instrument settings are changed, the invalid data indicator will display as long as that trace remains in View. Traces that are blanked do not turn on the invalid data indicator.

Not all instrument settings require display of the invalid data indicator when they change; only changes that require a new acquisition will cause it to display. For example, changing the Y-Axis scale of the instrument does not cause the invalid data indicator to display, unless the attenuation changes.

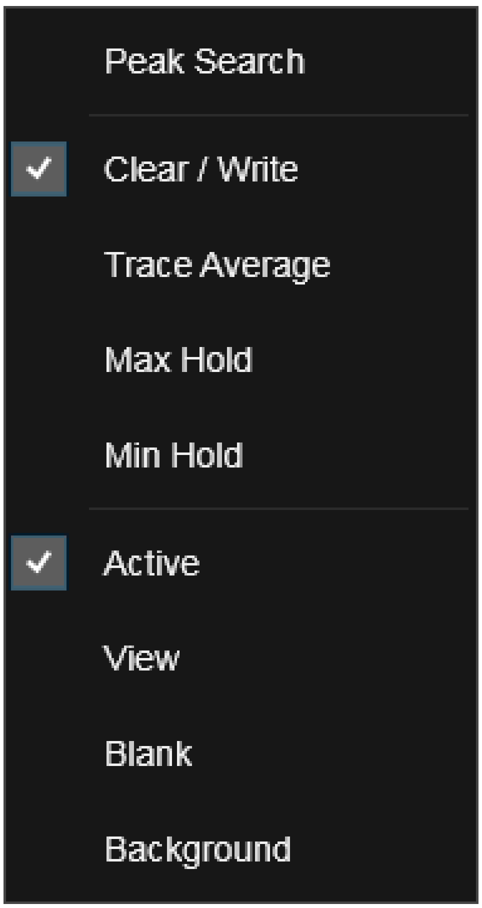
The invalid data indicator is also turned on:

- When the counter is turned on, until the completion of the first count
- When a trace is imported from mass storage and the trace’s parameters do not match the current instrument settings
- When a trace is sent to the instrument from a remote interface (since there is no way to know if its settings match)

NOTE	The Invalid Data Indicator has an associated status bit that can be checked at any time to see if the indicator is on.

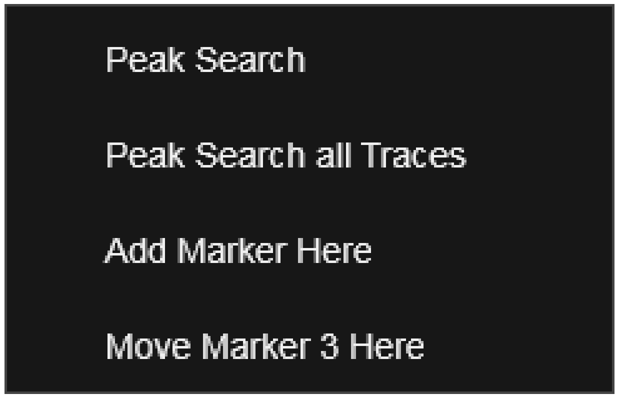
Trace right-click menu

If you right-click on a trace (or touch and hold a trace and wait for the circle to close), the **Trace Right-Click** menu appears:



If you now tap or click on one of the items in this menu, it performs the corresponding function. **Peak Search** finds the highest peak on the selected Trace (see "Peak Search" on page 318). **Clear/Write**, **Trace Average**, **Max Hold** and **Min Hold** set the "Trace Type" on page 1905. **Active**, **View**, **Blank**, and **Background** set the "View/Blank" on page 1721 type.

If you right-click on the trace (or touch and hold the trace and wait for the circle to close) in the **Waterfall** window (for example, in the **Spectrogram** View), the **Waterfall Trace Right-Click** menu appears:



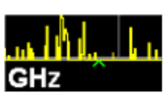
Peak Search works as above. **Peak Search all Traces** finds the highest peak in the **Waterfall** window (see "Peak Search All Traces" on page 319). **Add Marker Here** takes the lowest-numbered marker that is currently **Off** and turns it on as a **Normal** marker in the **Waterfall** window at the point where you right-clicked (or touched-and-held). **Move Marker n Here** moves the currently selected marker to the point in the **Waterfall** window where you right-clicked (or touched-and-held).

Trace Update Indicator

Trace updates can take one of two forms:

1. The trace is updated in a single operation that affects all the points in the trace at once. This happens, for example, in the case of very fast (< 200 ms) sweeps, single-chunk FFTs, and the initial math operation after a math function is set for a trace
2. The trace is updated in a series of discrete steps, with measurement data being gathered between each step. This is the case for slow sweeps, multi-chunk FFTs, gated sweeps, etc.

In the first case, no update indicator is required. In the second case, however, a visual indicator exists on the trace where the new data is being written, a green "caret" (^) , which moves across the bottom of the graticule showing the current trace point.



Trace Annunciator Panel

The trace annunciator panel appears on the right-hand side of the Meas Bar. Here is an explanation of the fields in this panel:

On the top line each trace number is shown, in the trace color. A blue box is drawn around the currently selected trace.

Below each trace number, is a letter signifying the trace type for that trace number, where

W	Clear/Write
A	Trace Average
M	Max Hold
m	Min Hold

If the letter is white, it means the trace is being updated (**Update** = **On**); if the letter is dimmed , it means the trace is not being updated (**Update** = **Off**). A strikethrough (for example, W) indicates that the trace is blanked (**Display** = **Off**). Note that it is possible for a trace to be updating and blanked, which is useful if the trace is a trace math component.

The third line shows the detector type for each trace, or, if trace math is on for that trace, it shows f (for "Math Function"). It is not always possible to have a unique detector for each trace, but the instrument hardware provides the maximum flexibility of detector selection to maintain the highest accuracy.

The letters used for this readout are

N	Normal
A	Average
P	Peak
p	Negative Peak
S	Sample
Q	Quasi Peak
E	EMI Average
R	RMS Average
f	Math Function

If the DET letter is green, it means the detector is in **Auto**; if it is white, it means the detector has been manually selected.

So, in the example above, the panel shows the following:

Trace 1	Visible, being updated, in **Clear/Write**, with **Normal** detector auto selected
Trace 2	Visible, being updated, in **Clear/Write**, being written to with a math function
Trace 3	Visible, not updating, data was taken in **Max Hold**, with **Peak** detector auto selected
Trace 4	Blanked, not updating, data was taken with **Averaging** turned on, **Sample** detector manually selected
Trace 5	Visible, not updating, data was taken in **Min Hold** with **Negative Peak** detector auto selected
Trace 6	Blanked, not updating, in **Clear/Write**, with **Normal** detector manually selected

Trace Annotation

When "Trace Annotation" on page 1981 (see **Display** menu) is **On**, each non-blanked trace is labeled on the trace with the detector used to take it, unless a trace math function is on for that trace, in which case it is labeled with the math function.

The detector labels are:

`NORM`	Normal
`PEAK`	Peak
`SAMP`	Sample
`NPEAK`	Negative Peak
`RMS`	Average detector with Power Average (RMS)
`LG AVG`	Average detector with Log-Pwr Average
`VAVG`	Average detector with Voltage Average
`QPEAK`	Quasi Peak
`EMI AVG`	EMI Average
`RMS AVG`	RMS Average

The trace math labels are:

`PDIF`	Power Difference
`PSUM`	Power Sum
`LOFF`	Log Offset
`LDIF`	Log Difference

3.2.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Dependencies	For the Swept SA measurement: – In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View – When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when **Meas Method** is `RBW`, `FAST` or `FPOWer`, **Select Trace** is disabled
Preset	Trace 1
State Saved	Yes

3.2.10.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 1905 and its update mode.

There are four Trace Types:

– Clear/Write

– Trace Average

– Max Hold

– Min Hold

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display,** are described fully in the "View/Blank" on page 1721 control description. Essentially, when **Update** is `ON`, a trace is updating, and when **Update** is `OFF` it is not. When **Display** is `ON`, it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	`WRITe`	`:TRAC2:TYPE WRIT`	See: "Clear/Write" on page 512
Trace Average	`AVERage`	`:TRAC2:TYPE AVER`	See: "Trace Average" on page 513

Option	Parameter	SCPI Example	Details
Maximum Hold	`MAXHold`	`:TRAC3:TYPE MAXH`	See: "Max Hold" on page 514
Minimum Hold	`MINHold`	`:TRAC5:TYPE MINH`	See: "Min Hold" on page 514

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "View/Blank" on page 1721 state must be set to **Active** (**Update**: `ON`, **Display**: `ON`) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "Trace Mode Backwards Compatibility Commands" on page 510

Remote Command	For Swept SA Measurement (in SA Mode): `:TRACe[1]|2|…|6:TYPE WRITe	AVERage	MAXHold	MINHold` `:TRACe[1]|2|…|6:TYPE?` For all other measurements: `:TRACe[1]|2|3:<meas>:TYPE WRITe	AVERage	MAXHold	MINHold` `:TRACe[1]|2|3:<meas>:TYPE?` where `<meas>` is the identifier for the current measurement
Example	`:TRAC:TYPE WRIT` `:TRAC:TYPE?`
Couplings	Selecting a **Trace Type** (by pressing any of the Trace Type selections or sending `:TRAC:TYPE`) sets the Trace to **Active** (**Update**: `ON`, **Display**: `OFF`), even if the same trace type was already selected When Detector setting is "Auto" (`[:SENSe]:<meas>:DETector:AUTO?)`, Detector `([:SENSe]:<meas>:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: "`NORMal`" with `WRITe` (Clear Write), "`AVERage`" with `AVERage`, "`POSitive` (peak)" with `MAXHold`, and "`NEGative` (peak)" with `MINHold`
Preset	Swept SA and Monitor Spectrum: `WRITe` All other measurements: `AVERage` Following **Preset**, all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the "Trace Modes" were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "View/Blank" on page 1721.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The :`TRACe:MODE` command is retained for backwards compatibility, and the :`TRACe:TYPE`, :`TRACe:UPDate` and :`TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup**, **Legacy Compatibility** menu is `ON`, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	`WRITe`
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	`:TRACe[1]|2|…|6:MODE WRITe | MAXHold | MINHold | VIEW | BLANk` `:TRACe[1]|2|…|6:MODE?`
Backwards Compatibility Notes	The legacy `:TRACe:MODE` command is retained for backwards compatibility. In conjunction with the legacy `:AVErage` command, it works as follows: – `:AVErage ON|OFF` sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the `[:SENSe]:AVERage[:STATe]` command description below – `:TRACe:MODE WRITe` sets `:TRACe:TYPE WRITe` (Clear/Write) unless average is true, in which case it sets it to `:TRACe:TYPE AVErage`. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace

	– `:TRACe:MODE BLANk` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANk`, the query response will not be what you sent `:TRACe[n]:MODE` was formerly used to set the type or "writing mode" of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold** As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does Also, previous to X-Series: – Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence – Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case
Preset	`OFF`
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	`[:SENSe]:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:AVERage[:STATe]?`
Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command `[:SENSe]:AVERage [:STATe] ON|OFF|1|0` was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command `[:SENSe]:AVERage[:STATe] OFF|ON|0|1.` When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average, Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average, Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup.**

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like Center Frequency or Attenuation), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup.**

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold,** clears the trace , initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold,** clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1905 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

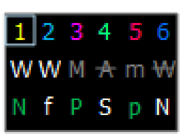
- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF; Display ON
Blank	Update OFF; Display OFF
Background	Update ON, Display OFF Allows a trace to be blanked *and* continue to update “in the background”, which was not possible in the past

In the Swept SA measurement, a trace with **Display**OFF is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **Update**OFF is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **Update**OFF, and Traces 4 and 6 have **Display**OFF.



See: "More Information" on page 517

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 516 and "Trace Display State On/Off" on page 516 below
Dependencies	When Signal ID is on, this key is grayed-out

Couplings	Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update ON and Display ON), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending `[:SENS]:DET:TRAC`) puts the trace in **Active** (**Update**ON and **Display**ON**)**, even if that detector was already selected Selecting a "Math Function" on page 1724 other than `OFF` for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (**Update**ON and **Display**ON**)**, even if that Math Mode was already selected Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:UPDate[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 2 inactive (stop updating): `:TRAC2:UPD 0`
Couplings	Whenever you set **Update** to ON for any trace**,** the **Display** is set to ON for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	ON for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	ON for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:DISPlay[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 1 visible:
	`:TRAC2:DISP 1`
	Blank trace 3:
	`:TRAC3:DISP 3`

Couplings	Whenever you set **Update** to `ON` for any trace**,** the **Display** is set to `ON` for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	`ON` for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	`ON` for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display**=`OFF`) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update**=`ON`), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display**=`OFF` and/or **Update**=`OFF` does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

Trace Settings Table

Lets you configure the Trace system using a visual utility.

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = `OFF`.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.2.10.3 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Selects a specific detector for the current measurement. The detector selected is then applied to the selected trace.

The instrument is in Auto detection by default, and normally Auto detection will choose the best detector for you automatically. If you choose a detector manually, this will turn Auto detection off for the selected trace.

For the SCPI UI, two commands are provided. One is a legacy command, which affects all traces. There is also a command which is new for the X-Series, which uses a subopcode to specify to which trace the specified detector is to be applied.

The three detectors at the end of the Detector menu, Quasi Peak, EMI Average, and RMS Average, are referred to collectively as the “CISPR detectors” because their behaviors are specified by the CISPR 16–1–1 specification. These detectors appear only if the N6141A or W6141A application or Option EMC installed and licensed.

NOTE **The instrument can typically provide 3 different detectors simultaneously. Occasionally the instrument can only provide 2 simultaneous detectors, typically when the Average detector is selected. When one of the CISPR detectors is selected, it is only possible to have that one detector, so all active traces change to that detector. It is never possible to have more than 3 simultaneous detectors.**

– "Detector Basics" on page 522
– "Detector Notes" on page 522
– "CISPR Detector Notes" on page 524
– "Multiple Detectors" on page 525

Remote Command	`[:SENSe]:DETector:TRACe[1]|2|…|6 AVERage | NEGative | NORMal | POSitive | SAMPle | QPEak | EAVerage | RAVerage`
	For options, see "Option Details" on page 521
	`[:SENSe]:DETector:TRACe[1]|2|…|6?`

Example	`:DET:TRAC AVER`
	Sets trace 1's detector to average
	`:DET:TRAC1 AVER`
	Sets trace 1's detector to average
	`:DET:TRAC2 SAMP`
	Sets trace 2's detector to sample

Notes	The query returns a name that corresponds to the detector type as shown below, and indicates the setting for Trace 1:

String Returned	Definition
NORM	Normal
AVER	Average / RMS
POS	Positive peak
SAMP	Sample
NEG	Negative peak
QPE	Quasi Peak
EAV	EMI Average
RAV	RMS Average

Dependencies	When Tune & Listen is on, or Demod Audio is the selected Analog Output, all active traces are forced to use the same detector CISPR detectors are grayed-out when you have manually selected FFT sweep. Conversely, if any CISPR detector is selected on an active trace, the auto rules for sweep type will never select FFT, and manual FFT selection is grayed-out When Signal ID is on, the **Detector** key is grayed-out for Traces 2-6 in Image Suppress mode and for Traces 3-6 in Image Shift Mode The VBW filter is not used for the Average detector or any of the CISPR detectors (Quasi Peak, EMI Average, RMS Average), as indicated by a * after the VBW value on the graph if any of these detectors is selected for any updating trace It is never possible to have more than 3 simultaneous detectors, and sometimes fewer than three. If the instrument has to enforce this limit a message is generated, "Detector n changed due to physical

	constraints" where "n" is the detector number
Couplings	Selecting a detector for a trace (pressing the key or sending `[:SENS]:DET:TRAC`) puts **Update On and Display On** for that trace, even if that detector was already selected. Note that the legacy command `[:SENS]:DET[:FUNC]` does *not* exhibit this behavior The auto detector rules depend upon marker type, averaging state and type, trace state writing mode, and trace active state Selecting a detector, whether by pressing the control or sending the equivalent command, turns trace math to Off for the selected/specified trace Use of the Average detector affects the VBW setting because of its effect on the VBW/RBW coupling. See the BW key description Selecting any CISPR detector on any active trace sets the EMC Standard to CISPR. If any trace with a CISPR detector becomes active, the EMC Standard is set to CISPR If the Avg Type is in Auto, and any of the CISPR detectors is selected on any active trace, the Voltage Averaging type is auto-selected
Preset	Preset returns all traces to "auto", which will result in Normal (Rosenfell) detection for all traces
State Saved	Saved in instrument state
Annunciation	The detectors currently selected are annunciated in the Trace Panel on the right side of the Meas Bar
Annotation	The four-letter mnemonic for the detector appears in the trace window next to the trace it applies to if Trace Annotation is on
Backwards Compatibility Notes	In the X-Series, the detector selected is applied to the selected trace. This differs from previous instruments, where the selected detector was applied to all traces, and you could only have one detector

Backwards Compatibility Command

Example	`:DET AVER`
	Sets detector to average for all traces
	`:DET:FUNC?`
	Returns trace 1's detector setting

Notes	This is a SCPI-only legacy command to preserve the classic functionality wherein all traces are affected when a detector is selected (in the X-Series, the detector is set on a per-trace basis) The query returns a name that corresponds to the detector type as shown below, and indicates the setting for Trace 1 The `RMS` selection sets the detector type to `AVERage` and the Average Type to `RMS`. Therefore, if RMS has been selected, the query will return `AVER` The `EPOS` selection sets the detector type to Peak and the EMC Standard to CISPR. A query then returns `POS` The `MPOS` selection sets the detector type to Peak and the EMC Standard to MIL Impulse. A query then returns `POS` The `RAV` parameter is not included in the command because this is not a legacy detector; nonetheless, if it happens to be the detector on Trace 1 then `RAV` is returned

	String Returned	**Definition**
	NORM	Normal
	AVER	Average / RMS
	POS	Positive peak
	SAMP	Sample
	NEG	Negative peak
	QPE	Quasi Peak
	EAV	EMI Average
	RAV	RMS Average
Preset	NORMal	
State Saved	Saved in instrument state	
Backwards Compatibility SCPI	[:SENSe]:DETector[:FUNCtion] NORMal | AVERage | POSitive | SAMPle | NEGative | QPEak | EAVerage | EPOSitive | MPOSitive | RMS [:SENSe]:DETector[:FUNCtion]?	
Backwards Compatibility Notes	In ESA and E7400, selecting QPD or EMI Average sets the Amplitude Scale Type to Linear and performs an auto-ranging function resulting in the Reference Level being adjusted such that the highest level of the trace is near (but below) the Reference Level. Subsequent selection of Peak, Negative Peak, Sample, or Average (the 'non-EMI Detectors') will return the Reference Level and Amplitude Scale Type to their pre-EMI Detector values. The X-Series does not perform this scale and reference level change because the digital IF makes it unnecessary The commands that select the CISPR detectors are not generally compatible with pre-PSA instruments, because the CISPR detectors are now part of the overall detector set, rather than a separate set. However, the basic behavior of coupling the resolution bandwidth to the selected detector is similar to the behavior of previous EMI instruments, like the E4400B series The following ESA/E7400 detector commands are no longer accepted: [:SENSe]:DETector[:FUNCtion]:EMI QPD | AVERage | OFF [:SENSe]:POWer:QPGain[:STATe] [:SENSe]:ARDT	

Option Details

Value	SCPI	Notes
Normal	NORMal	Determines the peak of CW-like signals, and yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
Average	AVERage	Determines the average of the signal within the bucket. The averaging method depends upon Average Type selection (voltage, power or log scales) and delivers: RMS detection when Avg Type = Power Video detection when Avg Type = Log-Pwr Scalar detection when Avg Type = Voltage
Peak	POSitive	Determines the highest signal within the bucket

Value	SCPI	Notes
Sample	`SAMPle`	Determines the instantaneous level of the signal at the center of the bucket
Negative Peak	`NEGative`	Determines the minimum of the signal within the bucket
Quasi Peak	`QPEak`	EMI – CISPR detector Only appears with the N6141A or W6141A application or Option EMC installed and licensed A fast-rise, slow-fall detector used in making CISPR compliant EMI measurements, compliant with the latest CISPR 16-1-1 standard
EMI Average	`EAVerage`	EMI – CISPR detector Only appears with the N6141A or W6141A application or Option EMC installed and licensed Provides a standard means to “smooth” the signal while still providing compliance to CISPR pulse response standards. It displays the average value of the amplitude envelope, rather than the average value of sample-detected amplitude, and uses an advanced algorithm to realize a lowpass filter that conforms to the latest CISPR 16-1-1standard
RMS Average	`RAVerage`	EMI – CISPR detector Not to be confused with the RMS mode of the regular Average detector, this is a special frequency-dependent EMI filter which only appears when the N6141A or W6141A application or Option EMC is installed and licensed This filter conforms to the latest revision of the CISPR 16–1–1 standard

Detector Basics

To understand detectors, you must understand the concept of trace buckets. For every trace point in swept and zero span analysis, there is a finite time during which the data for that point is collected. The instrument has the ability to look at all of the data collected during that time and present a single point of trace data based on the detector type. We call the interval during which the data is being collected the “bucket.” Often the term “trace point” is used to mean the same thing.

However, it is important to understand that a trace is more than a series of single points. The data is sampled rapidly enough within each “bucket” and processed so that the detector results are equivalent to those that would be achieved with a continuous time (non-sampled) system.

Detector Notes

– The VBW filter is not used for the Average detector or any of the CISPR detectors (Quasi Peak, EMI Average, RMS Average), so varying the VBW will have no effect for any traces for which this detector is selected (other than to slow down the sweep, because of the coupling to Sweep Time of VBW). If any traces for which

VBW does not apply are in Update On state (traces with Average, EMI Average, RMS Average or Quasi Peak detectors selected), then an * displays after the VBW annotation on the front panel.

- Rosenfell (Normal) detection: when the signal is CW-like, it displays the peak-detected level in the interval (bucket) being displayed. If the signal is noise-like (within a bucket the signal both rose and fell), it alternates displaying the max/min values. That is, an even bucket shows the peak (maximum) within a two-bucket wide interval centered on the even bucket. And an odd bucket will show the negative peak (minimum) within a two-bucket wide interval. For example, for an even bucket the two-bucket wide interval is a combination of one-half bucket to the left of the even bucket, the even bucket itself, and one-half bucket to the right of the even bucket, so the peak found is displayed in the correct relative location on screen. The odd buckets are similar.
- The Average Detector result depends on the Average Type. To explicitly set the averaging method, use the **Meas Setup**, **Average Type** key.
- Because they may not find a spectral component's true peak, neither average nor sample detectors measure amplitudes of CW signals as accurately as peak or normal, but they do measure noise without the biases of peak detection.
- Peak detection is used for CW measurements and some pulsed-RF measurements. For FFT analysis, the highest amplitude across the frequency width of a bucket is displayed, even if that peak amplitude falls between samples of the spectrum computed in the FFT process.
- Sample detection is good for displaying noise or noise-like signals but is not the best choice for making amplitude measurements of CW-like signals. This is because:
- the peak response to a signal can occur between samples. So, unless the Span to RBW ratio is lower than usual, then the highest sample can be well below the peak signal amplitude.
- for the high sweep rates normally used, the peak response of the RBW filters is up to –0.5 dB. This sweeping error is compensated when using the peak and normal detectors by changing the overall gain. But the gain is not changed when in the sample detector, because doing so would cause errors in the response to noise. Instead, the auto-couple rules for sweep time are modified to give slower sweeps.
- When the **Detector** choice is **Auto**, the detector selected depends on marker functions, trace functions, average type, and the trace averaging function.
- When you manually select a detector (instead of selecting **Auto**), that detector is used regardless of other instrument settings.

CISPR Detector Notes

Quasi Peak

This is a fast-rise, slow-fall detector used in making CISPR compliant EMI measurements and defined by CISPR Publication 16–1–1. Quasi-peak detection displays a weighted, sample-detected amplitude using specific, charge, discharge, and meter time constants derived from the legacy behaviors of analog detectors and meters. It is used for EMI measurements to provide a specific and consistent response to EMI-like signals.

In the past, Quasi Peak and EMI Average measurements were often made on a linear display scale (and CISPR standard operation calls for this), because those detectors only worked properly with signals on a linear (voltage) scale. The X-series instruments are capable of making Quasi Peak and EMI Average detected measurements correctly on a log scale, due to the digital IF. This latter capability means that the user can observe detected EMI levels on a log scale, allowing a large visible dynamic range. You can manually set the Average Type to Log-Power or Power, but the results will no longer be CISPR compliant.

Also, in the past, EMI analysis equipment would need to perform a ranging operation to set the reference level when one of these detectors was turned on, but the X-series instruments do not - because of its digital IF, there is no need to set the reference level (range) to improve the accuracy nor to allow visibility of the detected level.

EMI Average

The EMI Average detector in Agilent's X-Series instruments is so called to distinguish it from the Average detector, although EMI users typically refer to it simply as the “Average detector”. The intent of this detector is to provide a standard means to “smooth” the signal while still providing compliance to CISPR pulse response standards.

Unlike the regular Average detector, which averages on a bucket-by-bucket basis using either a power, log-power or voltage scale (a bucket is the same as a trace point), the EMI Average detector displays the average value, on the voltage scale, of the overall amplitude envelope, independent of the trace bucket width. It is defined for EMI measurements by the CISPR 16–1–1 standard and, in the X-series, uses a sophisticated algorithm to implement a lowpass filter that conforms to the latest CISPR standard.

Note that CISPR standard operation is to perform the envelope averaging on the voltage scale. You can manually set the Average Type to Log-Power or Power, but the results will no longer be CISPR compliant. See note under Quasi-Peak.

RMS Average

Not to be confused with the RMS mode of the regular Average detector, this is a special filter for making EMI measurements. It is a frequency dependent

RMS/Averaging filter, used in making CISPR compliant EMI measurements. This filter conforms to the 2007 revision of the CISPR 16–1–1 standard. This detector does one averaging process (in the VBW hardware) on the "power" (a.k.a. RMS) scale and another process on the voltage scale using a "meter movement simulator" similar to the one used in the QPD filter.

Note that CISPR standard operation is to perform the envelope averaging on the voltage scale. You can manually set the Average Type to Log-Power or Power, but the results will no longer be CISPR compliant. See note under Quasi-Peak.

Multiple Detectors

The instrument always provides the requested detector on the specified trace. Depending on the detectors requested the instrument can provide up to three different detectors simultaneously within the constraints of its digital processing algorithms. Some detectors utilize more resources; the Quasi-Peak detector, for example, utilizes most of the digital IF's resources, and the hardware in some instruments is incapable of providing another detector when Quasi-Peak is on. If the limit of system resources is exceeded, detectors on some existing traces may be forced to change. When this happens, they change to match the detector just requested, and a message is generated: “Detector <X> changed due to physical constraints”, where X might contain multiple values.

Example: User has traces 1, 2, and 3 with Peak, Average, and Negative Peak. User specifies QPD for trace 1. Traces 2 and 3 also change to QPD and we generate the message “Detector 2,3 changed due to physical constraints”. Now all three traces have the QPD.

Detector Select Auto/Man

Sets the Detector mode to Auto or Manual. In Auto, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you select any detector explicitly, this toggles automatically to Man (manual).

Remote Command	`[:SENSe]:DETector:TRACe[1]|2|…|6:AUTO ON | OFF | 1 | 0` `[:SENSe]:DETector:TRACe[1]|2|…|6:AUTO?`
Example	`:DET:TRACE2:AUTO ON` Sets trace 2 detection to automatic
Dependencies	The auto detector rules depend upon marker type, averaging state and type, trace state writing mode, and trace active state When operating a source in Tracking Source mode, Auto selection is the Average detector. All other detector selections are allowed, but in most cases you will want to stick with Average, which gives optimal sensitivity

Couplings	Selecting **Auto**, whether by pressing the control or sending the equivalent command, turns trace math `OFF` for the selected/specified trace
Preset	Auto (On) for all detectors
State Saved	Saved in instrument state

Backwards Compatibility Command

Example	`:DET:AUTO ON`
Notes	SCPI only. Turns AUTO on or off for *all* detectors. This is a legacy command to preserve the classic functionality wherein all traces are affected when a detector is addressed The query returns the Auto state of Trace 1
Backwards Compatibility SCPI	`[:SENSe]:DETector:AUTO ON | OFF | 1 | 0` `[:SENSe]:DETector:AUTO?`

Detector Auto All Traces

Returns the selected set of detectors to the “preset” state, which is auto-selected.

Dependencies	When Signal ID is on, this control is grayed-out
Couplings	Sets all traces’ Detector Auto to true

Detector Average Preset

Used to make a measurement of the average power and the signal envelope. This is a one-time setting of a commonly used detector set. It is quicker than making many individual changes and the detectors are free to change afterward. The effect is identical to just setting the traces’ detectors individually.

Dependencies	When Signal ID is on, this control is grayed-out
Couplings	Trace 1: Set to peak detection, and Clear-Write Trace 2: Set to average detection, and Clear-Write Trace 3: Set to negative peak detection, and Clear-Write

Detector Sample Preset

Used to make a measurement that displays a power sample and the signal envelope. This is not a “mode”, but a one-time setting of a commonly used detector set; it is quicker than making many individual changes, but the detectors are free to change afterward, the effect is identical to just setting the traces’ detectors individually.

Dependencies	When Signal ID is on, this control is grayed-out

Couplings	Trace 1: Set to peak detection, and Clear-Write Trace 2: Set to sample detection, and Clear-Write Trace 3: Set to negative peak detection, and Clear-Write

3.2.10.4 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1730 controls.

– See "How trace math is processed" on page 531

Remote Command	For option details, see "Trace Math Options" on page 529
	For Swept SA Measurement (in SA Mode):
	`:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate:MATH? <trace_num>`
	where `<trace_num>` is any one of:
	`TRACE1|…|TRACE6`
	For all other measurements:
	`:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate[:<meas>]:MATH? <trace_num>`
	where:
	`<meas>` is the identifier for the current measurement, and
	`<trace_num>` is any one of:
	`TRACe1|TRACe2|TRACe3`
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

	Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB
	`:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
	Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm
	`:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0`
	Turns off trace math for trace 1

Notes	The Trace Math Function command has 6 main set of parameters:
	- Set 1 defines the "result trace":
	`TRACE1|…|TRACE6`
	-Set 2 defines the "function":
	`PDIFference|PSUM|LOFFset|LDIFference|OFF`
	- Set 3 is a "trace operand" (1):
	`TRACE1|…|TRACE6`
	- Set 4 is a "trace operand" (2):
	`TRACE1|…|TRACE6`
	- Set 5 defines the "Log Offset" (in dB)
	- Set 6 defines the "Log Difference Reference" (in dBm)
	Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function
	The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message
	The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas

Dependencies	Trace Math is not available if **Normalize** is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = ON; and Update = ON

Preset	For Swept SA Measurement (in SA Mode):
	`OFF,TRACE5,TRACE6,0,0 | OFF,TRACE6,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0 | OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE4,0,0 | OFF,TRACE4,TRACE5,0,0`
	For all other measurements:
	`OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0`

State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An "f" is shown on the trace annunciation panel in the Measurement Bar when a math function is on;

	and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

```
DestinationTrace = FirstTrace + Offset
```

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-

B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = (FirstTrace - SecondTrace) + Reference
```

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

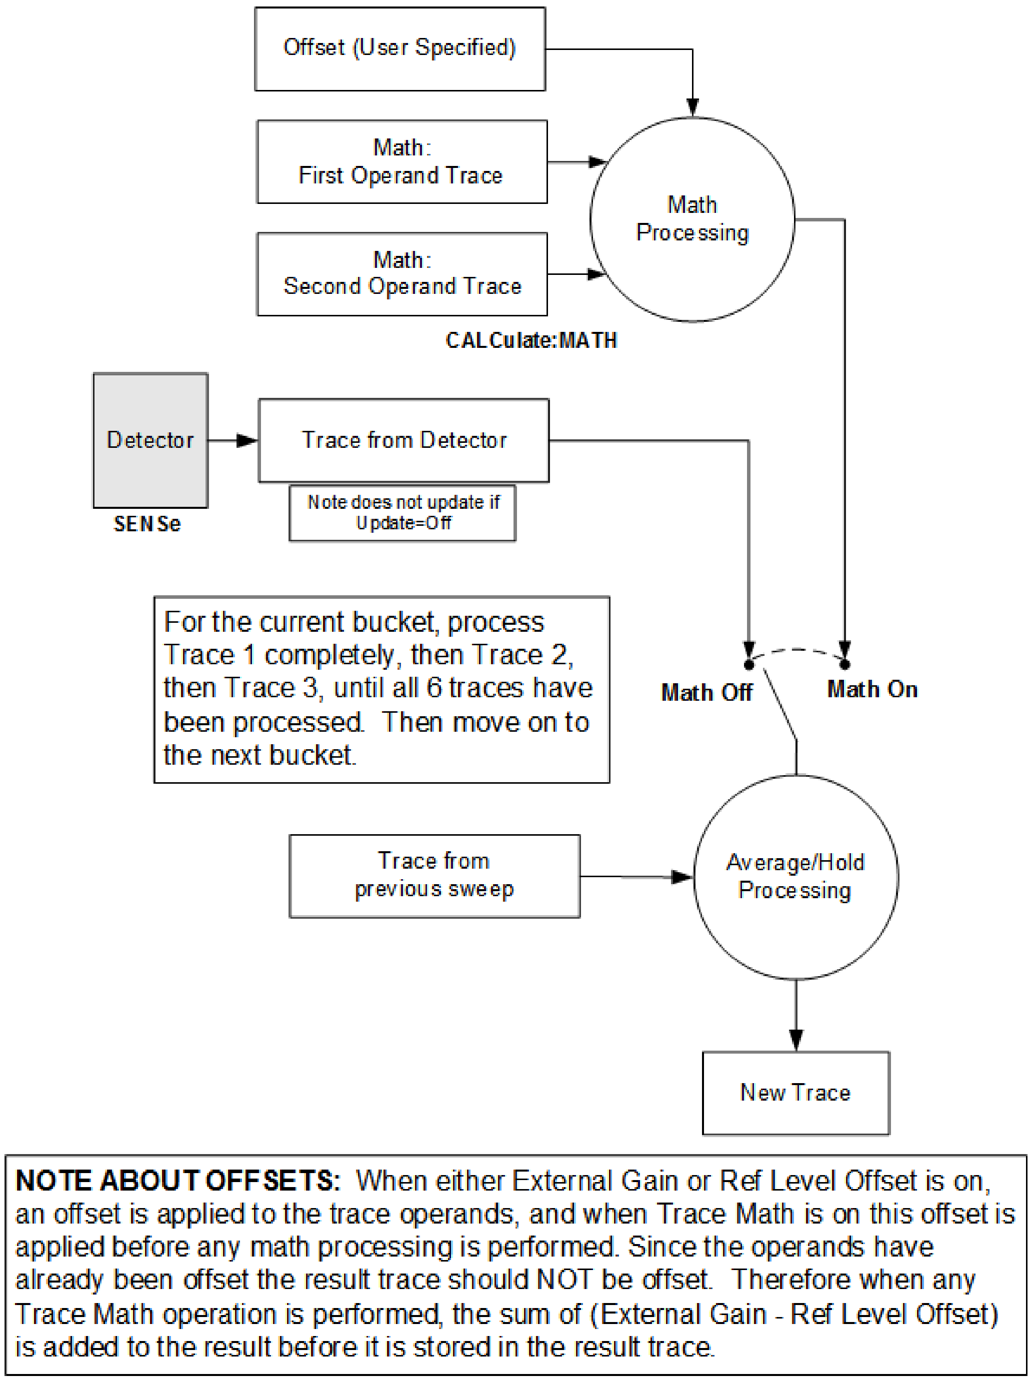
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement
	Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See "Math Function" on page 1724 for how to specify Operands 1 and 2 using `:CALCulate:MATH`
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.2.10.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1732 when a "Copy" on page 1732 or "Exchange" on page 1733 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the "From Trace" on page 1732 when a "Copy" on page 1732 or "Exchange" on page 1733 is performed

Preset	2

Copy

Executes a Trace Copy based on the "From Trace" on page 1732 and "To Trace" on page 1732 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On `:TRAC:COPY TRACE1,TRACE3`
Notes	The command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1732 and "To Trace" on page 1732 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `:TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Exchange Trace 1 and Trace 2 and put both traces in Update=`OFF`, Display=`ON`: `:TRAC:EXCH TRACE1,TRACE2`
Notes	The command is of the form: `:TRACe:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in **View** (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = `OFF`.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.2.10.6 Normalize

Lets you configure and execute functions to display one trace relative to a reference trace.

Normalize On/Off

Switches **Normalize** on or off. When ON, on each sweep, the normalized trace (Trace 3) is subtracted from Trace 1 and the result is added to the normalized reference level. This arithmetic assumes all values are in decibel units, so we are actually taking a ratio.

The steps to perform **Normalize** are:

– Store the current Trace 1 into the reference trace, which is Trace 3

– Turn on **Normalize**

If you try to turn on **Normalize** without first storing a reference trace, you will see an error.

When **Normalize** is ON, Y-Axis Unit (in the Amplitude menu) is grayed-out and forced to **dBm**, and Transducer Unit (in the Limit Editor) is grayed-out and forced to **None**.

See:

– "More Information" on page 538

– "Normalize Block Diagram" on page 539

Remote Command	`:CALCulate:NTData[:STATe] OFF | ON | 0 | 1` `:CALCulate:NTData[:STATe]?`
Example	`:CALC:NTD ON` `:CALC:NTD?`
Dependencies	If Normalize (On) is pressed before Store Ref (1→ 3), an error message is generated Normalize remains OFF in this case Normalize is not available (grayed-out) if any Trace Math function is on Normalize is not available if Amplitude, Scale Type is set to 'Lin"
Couplings	When **Normalize** is ON, Trace 1 is placed in **Clear/Write** with **Update** = ON and **Display** = ON
Preset	OFF
State Saved	Saved in instrument state

More Information

Normalize is most useful for applying correction data to a trace while making a stimulus-response measurement with a tracking generator (or synchronized source). For example, connect the cables and a through line, in place of the device to be measured, between the tracking generator and the instrument input. Notice that the frequency response is not perfectly flat, showing the response of the cables, as well as the flatness of both the tracking generator and the instrument. Now press **Store Ref (1→ 3)**, **NormalizeOn**. Notice that the displayed trace is now flat, or normalized. The position of the normalized trace can now be moved to a different position on the display by changing the normalized reference position. This may be useful if the device to be tested has positive gain, such as an amplifier. Now replace the through line with the device under test, and an accurate measurement of the gain or loss can be made.

Normalize can also be used to perform a scalar reflection measurement (return loss). In this case a directional coupler or bridge is used to extract the reflected signal. In the simplest reflection measurement, a Short is placed at the end of the cable and the result is stored to trace 3 (as before). When **Normalize** is turned on, the result is the calibrated return loss in dB. For a more accurate calibration, an Open and Short can be used. To do the Open/Short calibration, the Open/Short key at the bottom of the Normalize menu is pressed. This will initiate a guided calibration procedure which captures the reference trace. This is then stored to Trace 3, as before. When **Normalize** is turned on the corrected return loss is displayed.

Measurement Details

First the following calculation is performed:

Trace 1 = (Trace 1D – Normalized Trace)

Where:

- Trace 1D is the measured value of trace 1, as it comes from the SENSe subsystem
- Normalized Trace is Trace 3, in which you have previously stored a reference trace
- All values are in decibel units

This Trace 1 contains the values that will be returned from a trace query, or if the marker is placed on the trace.

For example, let's say bucket 1 on Trace 1 is at 0 dBm, and bucket 1 on Trace 3 is at 10 dBm. The resultant bucket is at 0 dBm – 10 dBm = –10 dB (just like with a delta marker).

You are also given the ability to define what (dB) value to use for Ref Level, and to define where on the screen the Ref Lvl line will appear using Normalized Reference Position. This flexibility in displaying the result allows a wide range of devices, including amplifiers, to be tested using Normalize.

In the example above, bucket 1 has the value of –10 dB. Let us assume you have set Norm Ref Lvl to 5 dB. Thus bucket 1 will display 1.5 divisions below the Reference Level line (assuming 10 dB per division).

The Reference Level line is normally the top line of the graticule. If Norm Ref Position is set to 10, this is the case. If it is set to 9, it is the next line down. If it is set to 5, it is the middle line of the graticule. If set to 0 it is the bottom line.

So, in the example above, if Norm Ref Position is set to 9, then bucket 1 will display 2.5 divisions below the top line of the graticule.

None of the manipulations of Norm Ref Position and Norm Ref Lvl affect the data in the trace.

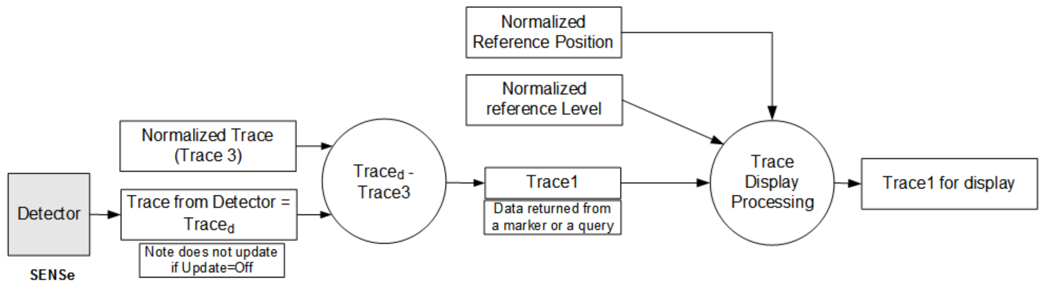
As **Normalize** displays a ratio between two traces (a difference, in dB) the Y-Axis Unit while in Normalize is dB in Log Amplitude and dimensionless in Linear. The Y Axis Unit chosen in the Y Axis Unit menu is unaffected by Normalize. When you leave Normalize the Y Axis Unit returns to the value set in the Y Axis Unit menu. While in Normalize, all amplitude functions, such as Marker Y and the values in other traces, should be always in dB unit, and so should the returned trace query results. In other words, both trace query result and marker Y become independent of the Y Axis Unit chosen in the Y Axis Unit menu when normalize is on.

(In Linear, the equivalent calculation is performed but it yields a dimensionless ratio, so the normalized ref level is unitless, presetting to 1, just as in Log it presets to 0 dB. Linear normalization is not currently available in the X-Series).

Y Axis annotation is blanked while in Normalize. Any other traces on the display are plotted in dB, where the dB value used is equivalent to the dBm value of the trace. For example, if bucket 1 in trace 2 is at –40 dBm, that bucket is plotted at –40 dB. All traces use Norm Ref Lvl and Norm Ref Position for positioning on the display. When Normalize exits, the normal Ref Lvl is restored. This normal Ref Level is unaffected by Normalize.

Normalize Block Diagram

This block diagram shows how Normalize works:



Store Reference (Trace1 -> Trace3)

Copies trace 1 into trace 3. Store Ref (1→ 3) must be pressed before pressing Normalize (On). Note that this puts Trace 3 in Update=OFF (not updating) and Display=ON (visible).

Notes	There is no remote command for this function, but the trace copy command can be used for this purpose
Dependencies	If Normalize (On) is pressed before Store Ref (1→ 3), an error message is generated. Normalize remains OFF in this case

Show Reference (Trace 3)

Views or blanks the reference trace on the display. The reference trace is trace 3, so this is the same as setting Trace 3's "Display" attribute.

Example	`:TRAC3:DISP 1` Shows the reference trace
Notes	Use the `:TRAC3:DISP` command to show or blank the reference trace Trace 3 is always the reference trace by definition
State Saved	Saved in instrument state

Norm Ref Lvl

Sets the level (in dB) of the normalized reference. This is the Level of the line specified by Norm Ref Position.

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:NRLevel <rel_ampl>` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:NRLevel?`
Example	`:DISP:WIND:TRAC:Y:NRL .10 dB` `:DISP:WIND:TRAC:Y:NRL?`
Preset	0 dB

State Saved	Saved in instrument state
Min	–327.6 dB
Max	327.6 dB

Norm Ref Position

Sets the graticule line that represents the Norm Ref Lvl. 10 is the top line and 0 is the bottom line. The normalized reference position is indicated with a white right arrow on the left side of the display and a white left arrow on the right side of the display, just inside the graticule.

This function may be used to offset the displayed trace without affecting the instrument gain or attenuation settings. This allows the displayed trace to be moved off the top of the screen so that it may be completely seen, but without decreasing measurement accuracy.

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:NRPosition <integer>` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:NRPosition?`
Example	`:DISP:WIND:TRAC:Y:NRP 5` `:DISP:WIND:TRAC:Y:NRP?`
Notes	The top and bottom graticule lines correspond to 10 and 0, respectively
Preset	10
State Saved	Saved in instrument state
Min	0
Max	10

Open/Short Cal

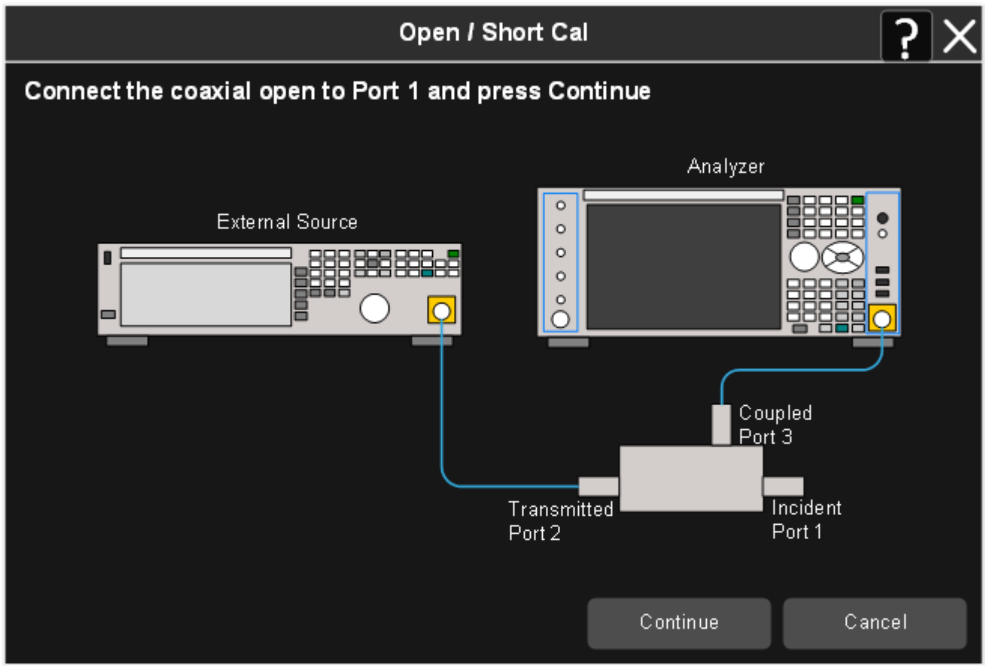
Performs a guided Open/Short Calibration, providing step-by-step instructions. This is the most accurate way to make the return loss measurement on the X-series instruments. You are directed through a 1-Port coaxial open calibration, and a 1-Port coaxial short calibration. The result can then be saved to Trace 3. It is used to perform calibrated scalar reflection measurements (return loss), using **Normalize**.

See "Open/Short Guided Cal" on page 541

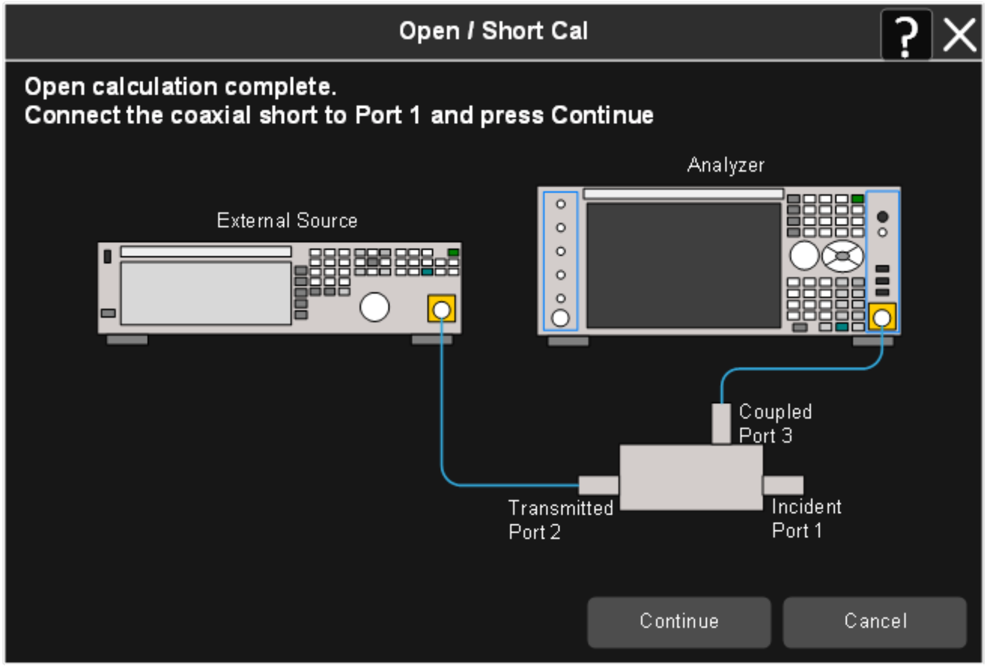
Notes	Does not auto return

Open/Short Guided Cal

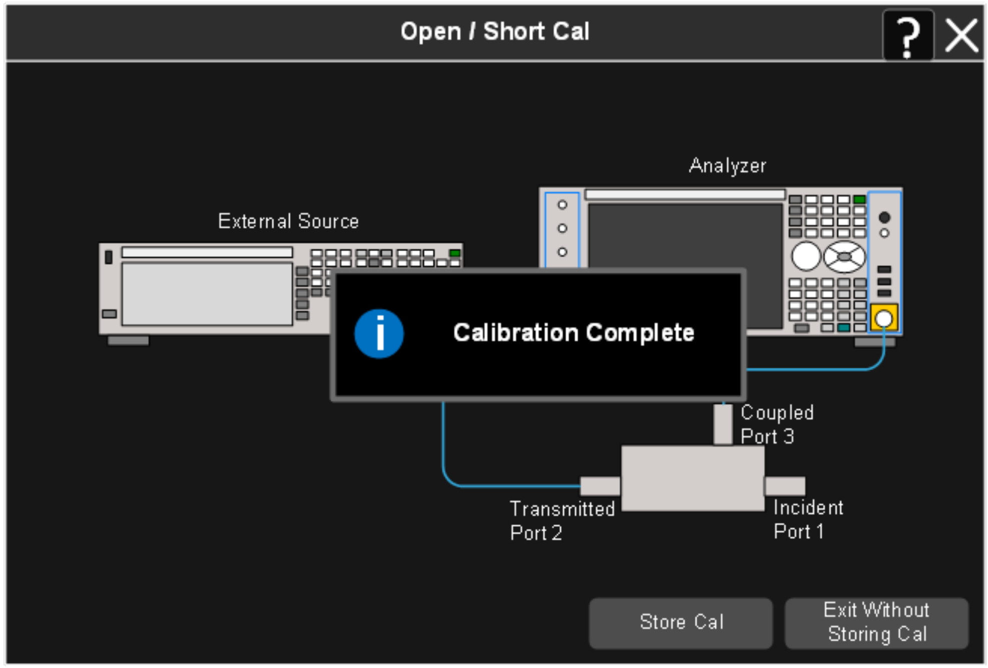
On pressing the **Open/Short Cal** control in the **Normalize** menu, the Open Calibration Form is displayed. The form shows a diagrammatic representation of how to connect the external source to the spectrum instrument to perform the calibration. When the **Continue** button is pressed, the Open calibration sweep is taken and stored in internal memory, for use later in this cal process. If the Cancel button is pressed, the Open/Short Cal is cancelled and the Normalize menu is returned.



On completion of the Open Calibration, the Short Calibration Form is displayed. This form shows a diagrammatic representation of how to connect the external source to the spectrum analyzer to perform the Short calibration. When the Continue button is pressed, the Short calibration sweep is taken and stored in internal memory, for use later in this cal process. If the Cancel button is pressed, the Open/Short Cal is cancelled and the Normalize menu is returned.



On completion of the Short Calibration, the Open and Short calibration measurements are averaged (power). The picture with prompt is taken off the screen and a menu with “Store Cal” and “Exit Without Storing Cal” is displayed. When you press “Store Cal” the resulting trace is stored to Trace 3. If the “Exit Without Storing Cal” button is pressed, the Open/Short Cal is cancelled. In either case you return to the Normalize menu.



The Open Short calibration is applied by taking the average of the Open and the Short trace. The average is a linear average point-by-point. You can further configure averaging on the traces (Open, Short, and final measurement). In this case, the value of the averaged Open and Short trace are linear averaged (by performing a point-by-point average of the two traces). Both the Open and the Short terminations should have approximately unity reflection. Taking the average gives the best estimate of a perfect reflector for a scalar return loss measurement. You should store the result in reference trace 3, for later application with the Normalize function.

3.3 Channel Power Measurement

This measurement is used to find the total power present in a specified bandwidth. Power Spectral Density (signal power normalized to 1 Hz) is also reported.

When in WLAN Mode, or when WLAN radio standard is selected in SA Mode, the peak Power Spectral Density for 1 MHz is reported.

Measurement Commands

The general functionality of "CONFigure" on page 2732, "INITiate" on page 2733, "FETCh" on page 2733, "MEASure" on page 2735, and "READ" on page 2734 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF:<Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

The tables below list setup commands for this measurement and queries to retrieve results.

Command	Function
`:INITiate:CHPower`	Initiates a trigger cycle for the CHP measurement, but does not return any data. You must then use `:FETC:CHP[n]?` to retrieve data Does not change any measurement settings
`:CONFigure?`	Returns the long form name of current measurement, in this case, `CHPower`
`:CONFigure:CHPower`	Selects CHP measurement with **Meas Setup** settings in preset state – same as "Meas Preset" on page 643
`:CONFigure:CHPower:NDEFault`	Selects CHP measurement *without* affecting settings

The following queries are used to retrieve data. The type of data returned depends on the value of n.

Query	Function
`:FETCh:CHPower[n]?`	Retrieves the data defined by n
`:MEASure:CHPower[n]?`	Switches to CHP measurement, restores default values, starts the measurement, then retrieves the data defined by n
`:READ:CHPower[n]?`	Starts the measurement, then retrieves the data defined by n

Backwards Compatibility Queries

Query	Return Value
`:FETCh:CHPower:CHPower?`	Returns the Channel Power (dBm)

Query	Return Value
:MEASure:CHPower:CHPower?	
:READ:CHPower:CHPower?	
:FETCh:CHPower:DENSity?	Returns the Power Spectral Density (dBm/Hz)
:MEASure:CHPower:DENSity?	
:READ:CHPower:DENSity?	

The results returned by the queries depend on the currently-selected Mode and the value of n (where required). The sections below provide mode-specific details for each Mode.

SA Mode Measurement Results

n	Results Returned		
1 or not specified	Returns scalar results:		
	1	Channel Power	A floating-point number representing the total channel power in the specified integration bandwidth
	2	PSD (Power Spectral Density)	The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 639; either dBm/Hz or dBm/MHz
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 624		
3	n/a		
4	n/a		
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by **Span**		
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by **Span**		

MSR Mode Measurement Results

n	Results Returned		
1 or not specified	Returns scalar results:		
	1	Channel Power	A floating-point number representing the total channel power in the specified integration bandwidth
	2	PSD (Power Spectral Density)	The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 639; either dBm/Hz or dBm/MHz
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 624		
3	Returns [Carriers] comma-separated scalar results, in the following order		

n	Results Returned
	<table><tr><th>#</th><th>Item</th><th>Unit</th></tr><tr><td>1</td><td>Total Power of Carrier 1</td><td>dBm</td></tr><tr><td>2</td><td>Total Power of Carrier 2</td><td>dBm</td></tr><tr><td>...</td><td>...</td><td></td></tr><tr><td>[Carriers]</td><td>Total Power of Carrier [Carriers]</td><td>dBm</td></tr></table> If the result is not available, NaN (9.91E+37) is returned. Number of returned values might be changed in future releases
4	Returns comma-separated scalar results, in the following order <table><tr><th>#</th><th>Item</th><th>Unit</th></tr><tr><td>1</td><td>Total Power of LTE FDD carriers</td><td>dBm</td></tr><tr><td>2</td><td>Total Power of W-CDMA carriers</td><td>dBm</td></tr><tr><td>3</td><td>Total Power of GSM/EDGE carriers</td><td>dBm</td></tr><tr><td>4</td><td>Total Power of cdma2000 carriers</td><td>dBm</td></tr><tr><td>5</td><td>Total Power of 1xEV-DO carriers</td><td>dBm</td></tr><tr><td>6</td><td>...</td><td></td></tr></table> The number of results is incremented by one when a new format is supported If the result is not available, NaN (9.91E+37) is returned. Number of returned values will be changed in future releases if the number of supported radio format is increased
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by the Span control
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by the Span control

LTE-Advanced FDD/TDD Mode Measurement Results

n	Results Returned
1 or not specified	Returns scalar results: <table><tr><td>1</td><td>Channel Power</td><td>A floating-point number representing the total channel power in the specified integration bandwidth</td></tr><tr><td>2</td><td>PSD (Power Spectral Density)</td><td>The power in the specified unit bandwidth. The unit bandwidth is selected by "PSD Unit" on page 639; either dBm/Hz or dBm/MHz</td></tr></table>
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by "Span" on page 624
3	Returns comma-separated scalar results, in the following order

<table>
<tr><th>n</th><th>Results Returned</th></tr>
<tr><td></td><td>

#	Item	Unit
1	Total Power of Component Carrier 0	dBm
2	Total Power of Component Carrier 1	dBm

3	n/a
4	n/a
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by **Span**
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by **Span**

Additionally, WLAN Mode supports an `n` parameter for the following queries:

`:FETCh:CHPower:DENSity[n]?`

`:MEASure:CHPower:DENSity[n]?`

`:READ:CHPower:DENSity[n]?`

For these queries *in WLAN Mode only*, the results returned depend on the value of `n` as follows:

n	Radio Standard	Results Returned
1 or not specified	*Not* 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	**Peak PSD (Power Spectral Density)** The Peak PSD over the integration bandwidth. The unit bandwidth is

n	Radio Standard	Results Returned
		selected by "PSD Unit" on page 639 in either dBm/Hz or dBm/MHz
	802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	The first value is the peak PSD for segment 1, the second value is the peak PSD for segment 2
2	*Not* 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	**Mean PSD (Power Spectral Density)** The Mean PSD over the integration bandwidth. The unit bandwidth is selected by **PSD Unit** in either dBm/Hz or dBm/MHz
	802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	The first value is the mean PSD for segment 1, the second value is the mean PSD for segment 2

3.3.1 Views

In SA, WCDMA, WLAN, SRCOMMS, and VMA Modes, there is only one predefined view, the "Normal" on page 552 view.

In MSR, LTEAFDD, LTEATDD, and 5GNR Modes, this measurement has two predefined views:

1. "Normal" on page 552
2. "Carrier Info" on page 552

View selection by name

Selects the results view by specifying the View name.

Remote Command	`:DISPlay:CHPower:VIEW[:SELect] PRESult | CINFormation` `:DISPlay:CHPower:VIEW[:SELect]?`
Example	`:DISP:CHP:VIEW PRES` `:DISP:CHP:VIEW?`
Preset	`PRESult`
State Saved	Saved in instrument state
Range	Power Results | Carrier Info

View selection by number

Selects the results view by specifying the View number.

Remote Command	`:DISPlay:CHPower:VIEW:NSELect <integer>` `:DISPlay:CHPower:VIEW:NSELect?`

Example	`:DISP:CHP:VIEW:NSEL 1` `:DISP:CHP:VIEW:NSEL?`
Preset	1
State Saved	Saved in instrument state
Min/Max	1 / 2

3.3.1.1 Normal

Windows: "Graph" on page 552, "Metrics" on page 553

Dual window view: Channel Power graph and Channel Power metrics.

Example	`:DISP:CHP:VIEW PRES`

3.3.1.2 Carrier Info

Windows: "Graph" on page 552, "Metrics" on page 553

Dual window view: Channel Power graph and Carrier Info table.

Example	`:DISP:CHP:VIEW CINF`
Dependencies	Only available in MSR, LTE-A FDD/TDD and 5G NR Modes

3.3.2 Windows

This section describes the windows that are available in the Channel Power measurement.

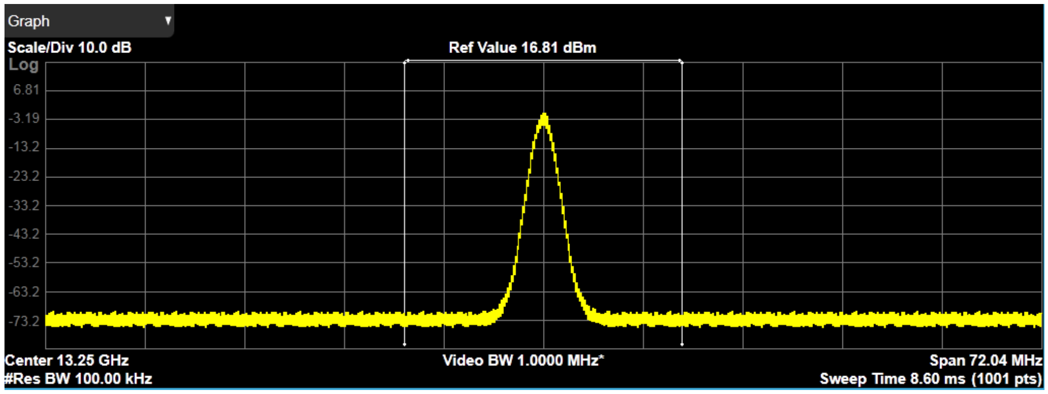
3.3.2.1 Graph

Used to display the spectrum trace and power bars.

The results of the measurement can be displayed as a single spectrum trace view or displayed with a Bar Graph trace on the spectrum trace. The Bar Graph appears between the markers that indicate the measured output power level. The bar graph is activated when the “Bar Graph” control is set to ON under the Display menu. The Graph window appears in the following views.

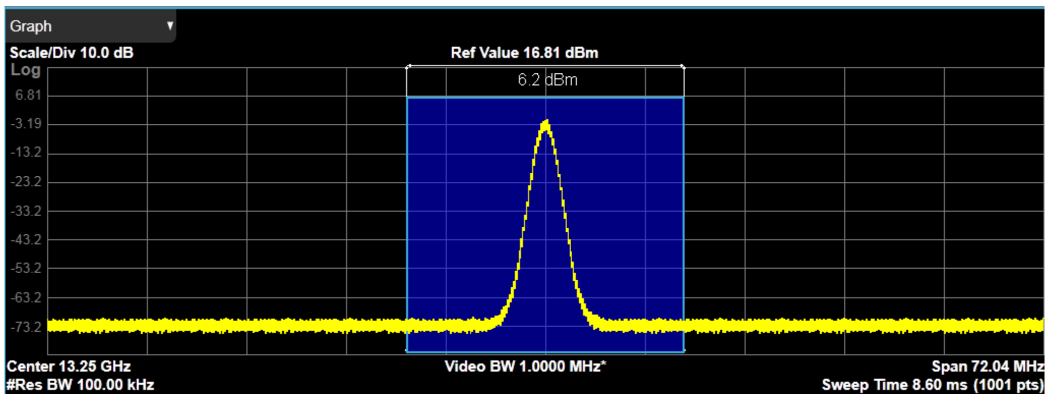
View	Size	Position
Normal	Two thirds, full width	Top
Gate View	One third, full width	Middle

Spectrum View with Bar Graph Off



Spectrum View with Bar Graph On

This is the same as the **Spectrum** view, but has a blue bar between the markers that indicates the measured output power level. The bar graph is activated when the "Bar Graph" control is set to ON under the **Display** hardkey. The actual measured output power level is displayed on the display at the top of the bar.



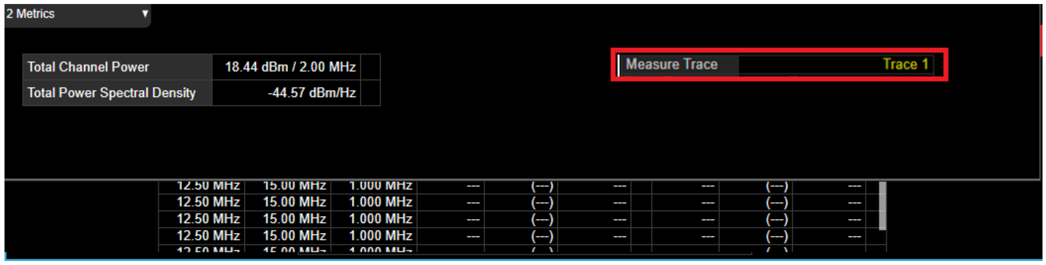
If the current Mode is WLAN and the format is WLAN 802.11ac 80+80 MHz, Spectrum View is slightly different so that the results of both carrier segments can be displayed.

3.3.2.2 Metrics

The actual measured output power level is displayed in the Metrics window

The **Metrics** window appears in the following Views.

View	Size	Position
Normal	One third, full width	Bottom
Gate View	One third, full width	Bottom



Measure Trace

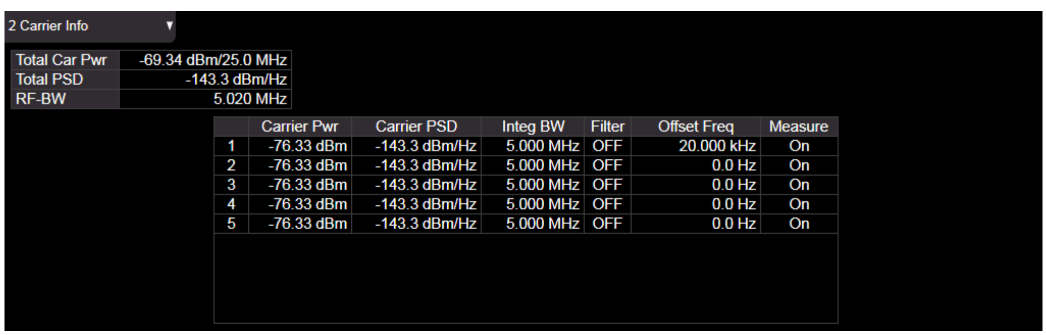
See: "Measure Trace" on page 1734.

Power Results

Total carrier power, total PSD and total format carrier power are displayed in the lower window. Total format carrier power is total power of carriers of the same Radio Format. If there is no carrier of the corresponding format, it is not displayed. Thus, items in the total format power table changes depending on the carrier configuration. Since the metrics window of MSR, LTE-Advanced FDD/TDD and 5G NR is slightly denser than that for common CHP, the vertical positions of total power and power spectral density are raised.

Carrier Info: LTE-Advanced FDD/TDD and 5G NR Modes

The following diagram shows the Metrics Window in the Carrier Info view for LTE-Advanced FDD/TDD and 5G NR. The Power Results window is replaced by the carrier info table.



The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ Bw) multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

Displays the channel bandwidth of each carrier.

Filter

Displays whether RRC filter is used or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block (LTE-Advanced FDD/TDD Modes only)

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes as either Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

Carrier Info: MSR Mode

The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ Bw) multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

Displays the channel bandwidth of each carrier.

Filter

Displays whether RRC filter is used or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes according to whether Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

Parameter Set

Displays which format parameter set is selected.

3.3.2.3 Gate

Turning on Gate View displays the Gate Window, which allows you to see your Gating signal at the same time as the measured data. See the description under **Gate View** in **Trigger**, **Gate Settings**.

View	Size	Position
Gate View	One third, full width	Top

3.3.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.3.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of "Ref Position" on page 565.

Remote Command	`:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`

Example	:DISP:CHP:WIND:TRAC:Y:RLEV 10 dBm :DISP:CHP:WIND:TRAC:Y:RLEV?
Couplings	When "Auto Scaling" on page 565 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to OFF Attenuation is not coupled to **Ref Value**
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule divisions on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

Remote Command	:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl> :DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?
Example	:DISP:CHP:WIND:TRAC:Y:PDIV 5 :DISP:CHP:WIND:TRAC:Y:PDIV?
Couplings	Coupled to "Scale Range" on page 1538 as follows: **Scale/Div** = **Scale Range**/10 (number of divisions) When "Auto Scaling" on page 565 is ON, this value is automatically determined by the measurement result When you change a value, **Auto Scaling** automatically changes to OFF
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace `<meas>` with the identifier for the current measurement
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl>`
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?`

Example	`:DISP:CHP:WIND:TRAC:Y:RANG 100` `:DISP:CHP:WIND:TRAC:Y:RANG?`
Couplings	Coupled to **Scale/Div** as follows **Scale Range** = **Scale/Div** * 10 (number of divisions) When you change this value, **Auto Scaling** automatically changes to `OFF`
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Y Axis Unit

Displays a dropdown menu that enables you to change the vertical (Y) axis amplitude unit. This setting affects how the data is read over the remote interface. When using the remote interface, only numerical values are returned, so you must know what the Y Axis Unit is to interpret the results. This is described in more detail in "Amplitude Data Query and Y Axis Unit" on page 562 below.

For measurements that support both Log and Lin scales, the instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales. For example, if Display Scale has been set to Log, and you set Y Axis Unit to dBm, pressing **Display Scale (Log)** sets the Y Axis Unit to dBm. If Display Scale has been set to Lin and you set Y Axis Unit to V, pressing **Display Scale (Lin)** sets the Y Axis Unit to V. Pressing **Display Scale (Log)** again sets the Y Axis Unit back to dBm.

If an Amplitude Correction is being applied that has an associated Transducer Unit, all selections but **Xducer Unit** are grayed-out. For more information, see "Transducer Unit" on page 563 below.

Remote Command	`:UNIT:POWer DBM | DBMV | DBMA | V | W | A | DBUV | DBUA | DBPW | DBUVM | DBUAM | DBPT | DBG` `:UNIT:POWer?`

Example	`:UNIT:POW dBmV`
	`:UNIT:POW?`
	See also "Remote Interface Examples" on page 560 below

Notes	The Y axis unit has either logarithmic or linear characteristics. The set of units that is logarithmic consists of dBm, dBmV, dBmA, dBmV, dBmA, dBmV/m, dBmA/m, dBpT, and dBG. The set of units that are linear consists of V, W, and A. The chosen unit will determine how the reference level and all the amplitude-related outputs like trace data, marker data, etc., read out
Dependencies	Appears only in Spectrum Analyzer Mode If an amplitude correction with a Transducer Unit other than None is applied and enabled: – The Transducer Unit selection is forced, and is the only Y Axis Unit available. The specific Transducer Unit is shown in square brackets in the dropdown, and all other Y Axis Unit choices are grayed-out – If you turn off that correction or set Apply Corrections to NO, the Y Axis Unit that existed before the Transducer Unit was applied is restored When Normalize is ON (in the **Trace**, **Normalize** menu), Y Axis Unit is grayed-out, and forced to dBm
Couplings	The instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales
Preset	dBm for log scale, V for linear. The true 'preset' value is dBm, since at preset the Y Display Scale is set to logarithmic
State Saved	Saved in instrument state
Annotation	The Y Axis Unit is shown after Ref Level value at the top of the graticule

Unit	Example	Notes
dBm	`:UNIT:POW DBM`	Y Axis Unit is set to dBm
dBmV	`:UNIT:POW DBMV`	Y Axis Unit is set to dBmV
dBmA	`:UNIT:POW DBMA`	Y Axis Unit is set to dBmA
W	`:UNIT:POW W`	Y Axis Unit is set to W
V	`:UNIT:POW V`	Y Axis Unit is set to V
A	`:UNIT:POW A`	Y Axis Unit is set to A
dBmV	`:UNIT:POW DBUV`	Y Axis Unit is set to dBmV
dBmA	`:UNIT:POW DBUA`	Y Axis Unit is dBmA. The unit dBuA can also appear as a Transducer Unit
dBpW	`:UNIT:POW DBPW`	Y Axis Unit is set to dBpW

Remote Interface Examples

Command examples and details appear in the table below. Note that each of the commands below sets the amplitude unit only for the *selected* amplitude scale (Log or Lin), the other scale is unaffected.

Unit	Example	Notes
dBm	:UNIT:POW DBM	dB relative to one milliwatt
dBmV	:UNIT:POW DBMV	dB relative to one millivolt
dBmA	:UNIT:POW DBMA	dB relative to one milliamp
W	:UNIT:POW W	Watts
V	:UNIT:POW V	Volts
A	:UNIT:POW A	Amperes
dBmV	:UNIT:POW DBUV	dB relative to one microvolt
dBmA	:UNIT:POW DBUA	dB relative to one microamp The unit dBuA can also appear as a "Transducer Unit" on page 563 When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA transducer unit. If :CORR:CSET:ANT? returns NOC (for No Conversion), you are using a normal Y Axis dBuA. If it returns UA, you are using a Transducer Unit dBuA
dBpW	:UNIT:POW DBPW	dB relative to one picowatt
dBmV/m (Transducer Unit)	:UNIT:POW DBUVM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmV/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 563
dBmA/m (Transducer Unit)	:UNIT:POW DBUAM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 563
dBpT (Transducer Unit)	:UNIT:POW DBPT	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBpT (dB relative to one picotesla). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 563
dBG (Transducer Unit)	:UNIT:POW DBG	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBG (dB relative to one Gauss). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 563
dBmA (Transducer Unit)	:UNIT:POW DBUA	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA. This selection is only available as a Transducer Unit if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 563 The unit dBuA can also appear as a normal Y Axis Unit (see above) dBuA as a Transducer Unit is used when using current probes, because current

Unit	Example	Notes
		probes are often supplied with conversion tables that provide the transducer factors. When dBuA is used as a Transducer Unit, the normal conversion from power to amps for dBuA (based on the instrument input impedance) is not done, but instead the conversion is based solely on the Correction that contains the transducer factors. This is what distinguishes dBuA as a normal unit from dBuA as a transducer unit When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA Transducer Unit. If `:CORR:CSET:ANT?` returns `NOC` (for No Conversion), you are using a normal Y-Axis dBuA. If it returns `UA`, you are using a Transducer Unit dBuA

Amplitude Data Query and Y Axis Unit

The settings of Y-Axis Unit and Display Scale affect how the data is returned over the remote interface in response to a query. When using the remote interface, no unit is returned, so you must know what the Y-Axis unit is to interpret the results:

Example 1

Set the following:

- Display Scale (Log)
- Y Axis Unit, dBm
- Scale/Div, 1 dB
- Ref Level, 10 dBm

This sets the top line to 10 dBm with each vertical division representing 1 dB. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 5 dBm and will read out remotely as 5.

Example 2

Set the following:

- Display Scale (Lin)
- Y Axis Unit, Volts
- Ref Level, 100 mV (10 mV/div)

This sets the top line to 100 mV and the bottom line to 0 V, so each vertical division represents 10 mV. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 50 mV and will read out remotely as 50.

NOTE **The units of current (A, dBmA, dBuA) are calculated based on 50 Ω input impedance.**

Transducer Unit

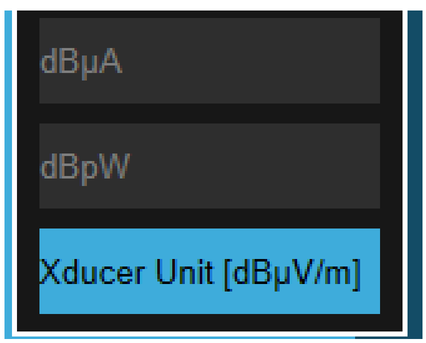
Transducer Units (formerly called Antenna Units) are units of field strength rather than amplitude, and are used when correcting the response of device such as antennas whose amplitude characteristics are measured in units of field strength. All five of the Transducer Units (dBmA/m, dBmV/m, dBG, dBpT, dBmA) are treated by the instrument exactly as though they were dBmV, when uncorrected. You must load an appropriate correction factor using Input/Output, Corrections for accurate and meaningful results.

If a remote command is sent to the instrument that uses one of the Transducer Units as a terminator, the instrument treats it as though DBUV had been sent as the terminator.

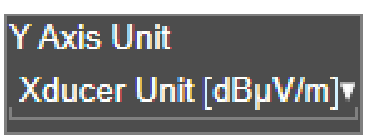
When a Correction is turned on that uses a Transducer Unit, the Y Axis Unit changes to that Transducer Unit. All of the selections in the **Y-Axis Unit** dropdown are then grayed-out, except the Transducer Unit selection. The unit being used is shown on this selection in square brackets, and appears on the control in square brackets preceded by **Xducer Unit**.

Example:

If the Transducer Unit in the Correction is dBmV/m, then the selection in the dropdown looks like this:



And on the control it looks like this:



NOTE If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output**, **Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output**, **Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

The Transducer Units are:

Units	Example
dBmV/m	:UNIT:POW DBUVM
dBmA/m	:UNIT:POW DBUAM
dBpT	:UNIT:POW DBPT
dBG	:UNIT:POW DBG
dBmA	:UNIT:POW DBUA
None	n/a

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off switch turns **Ref Level Offset** on or off. Setting a value turns **Ref Level Offset**ON.

Remote Command	:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet <rel_ampl> :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet?
Example	Set **Ref Level Offset** to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB is assumed: :DISP:WIND:TRAC:Y:RLEV:OFFS 12.7 :DISP:WIND:TRAC:Y:RLEV:OFFS?
Dependencies	Appears only in Spectrum Analyzer Mode
Preset	0 dBm
State Saved	Saved in instrument state
Min	Variable. Limited to values that keep the reference level within the range: -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as “Ref Offset <value>” to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown

Auto Function

Remote Command	:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF | ON | 0 | 1 :DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?
Example	:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON Turns Ref Level Offset On
Preset	OFF

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom :DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?
Example	:DISP:CHP:WIND:TRAC:Y:RPOS CENT :DISP:CHP:WIND:TRAC:Y:RPOS?
Preset	TOP
State Saved	Saved in instrument state
Range	TOP|CENTer|BOTTom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON :DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle?
Example	:DISP:CHP:WIND:TRAC:Y:COUP OFF :DISP:CHP:WIND:TRAC:Y:COUP?
Couplings	When **Auto Scaling** is ON, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change the value of **Scale/Div**, **Ref Value**, or **Scale Range**, **Auto Scaling** automatically changes to OFF
Preset	1
State Saved	Saved in instrument state

Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle

3.3.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 566
- See "Single-Attenuator Configuration" on page 567

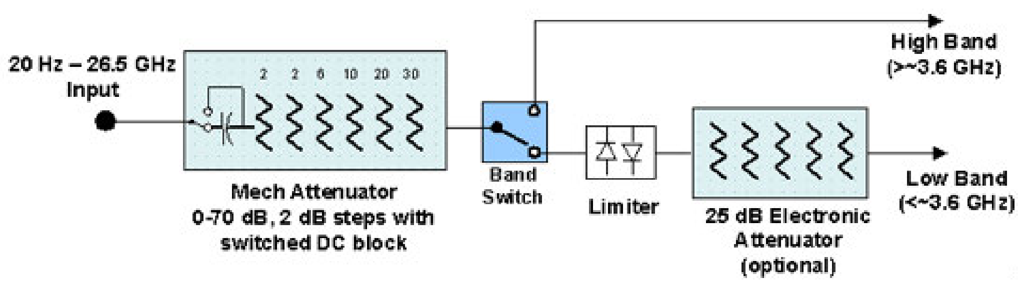
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9421A/10A/11A, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

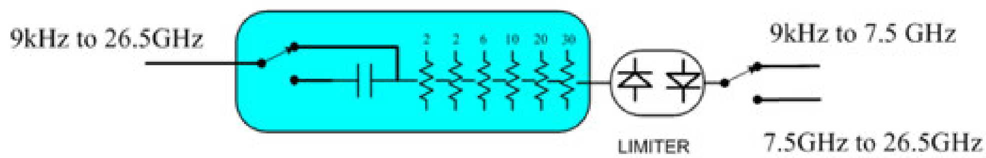
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

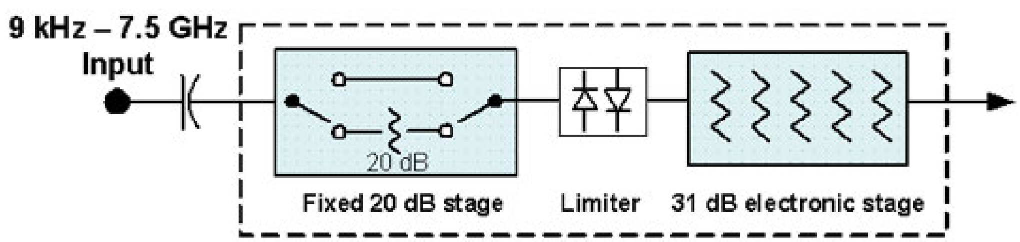


Configuration 2: Mechanical attenuator, no optional electronic attenuator

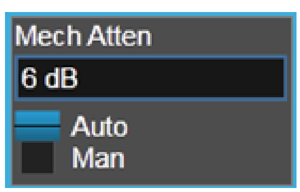


Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

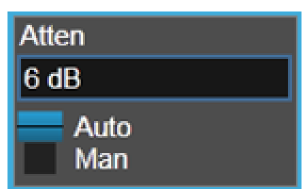
Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Dual Attenuator



Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 1935 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten In the **Amplitude**, "Y Scale" on page 1929 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows: “Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten “Total Atten above 50 GHz” followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 571

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

Dependencies	Some measurements do not support Auto setting of "Mech Atten" on page 569. In these measurements, the **Auto/Man** selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1937 See "Attenuator Configurations and Auto/Man" on page 571 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB

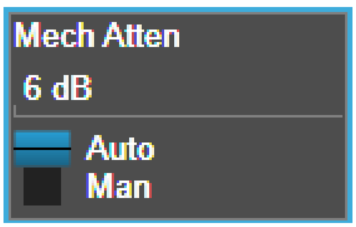
	(total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 569 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting will be changed to a multiple of 10 dB which will be no smaller than the previous setting. For example, 4 dB attenuation will be changed to 10 dB
Preset	The preset for Mech Attenuation is “Auto” The Auto value of attenuation is 10 dB ON
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: A: 24 dB (e14) Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described under "Y Scale" on page 1929, there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 569 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation.

See "Elec Atten" on page 1937 for more about “soft” attenuation.

NOTE In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details about the Electronic Attenuator, see "More Information" on page 573

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation's specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 1959 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 1960 is `ON`, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode

	The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 573
Preset	0 dB OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 574 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the "soft" attenuation feature replaces the Dual-Attenuator configuration's electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1937

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved

- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1942.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in 5G NR Mode only

Adjust Atten

Allows you to select;

– Electric attenuator only

– Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements

	Appears in the Waveform measurement in 5G NR Mode only
Preset	COMBined
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1941 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 577

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECtrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

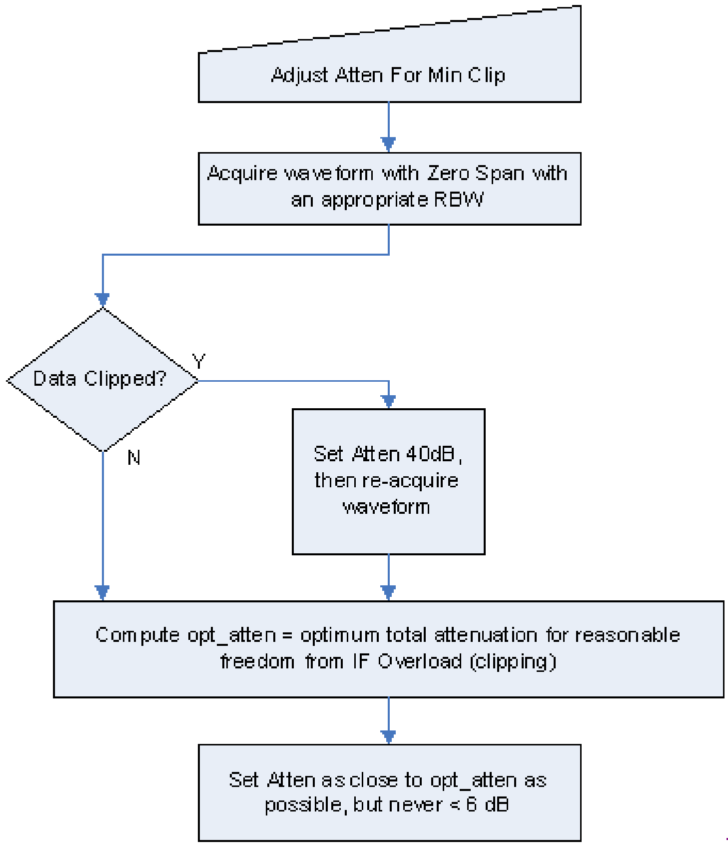
Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 1937 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 576 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, available only in 5G NR Mode

Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On
Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?

Adjustment Algorithm

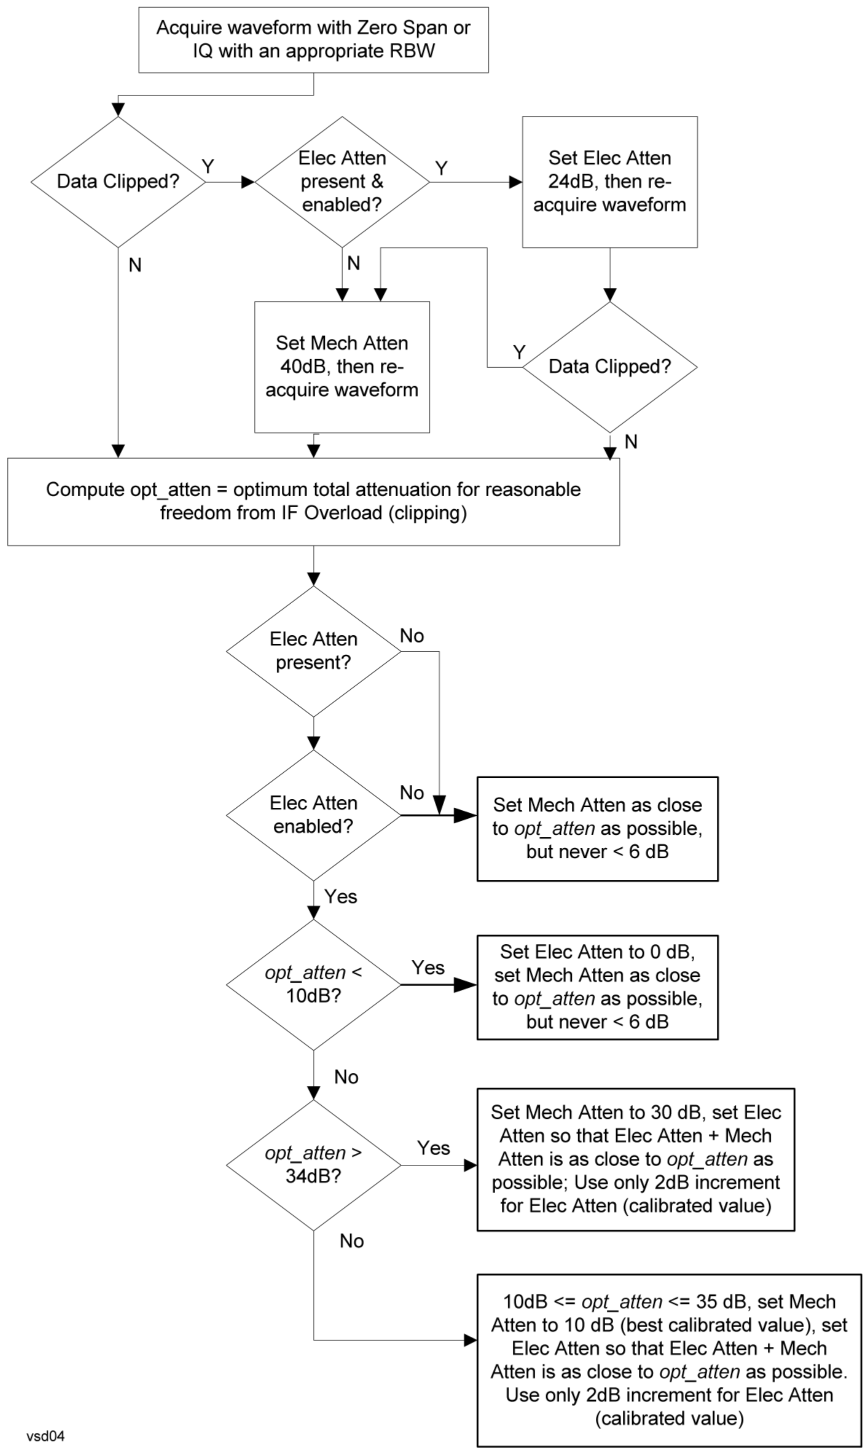
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

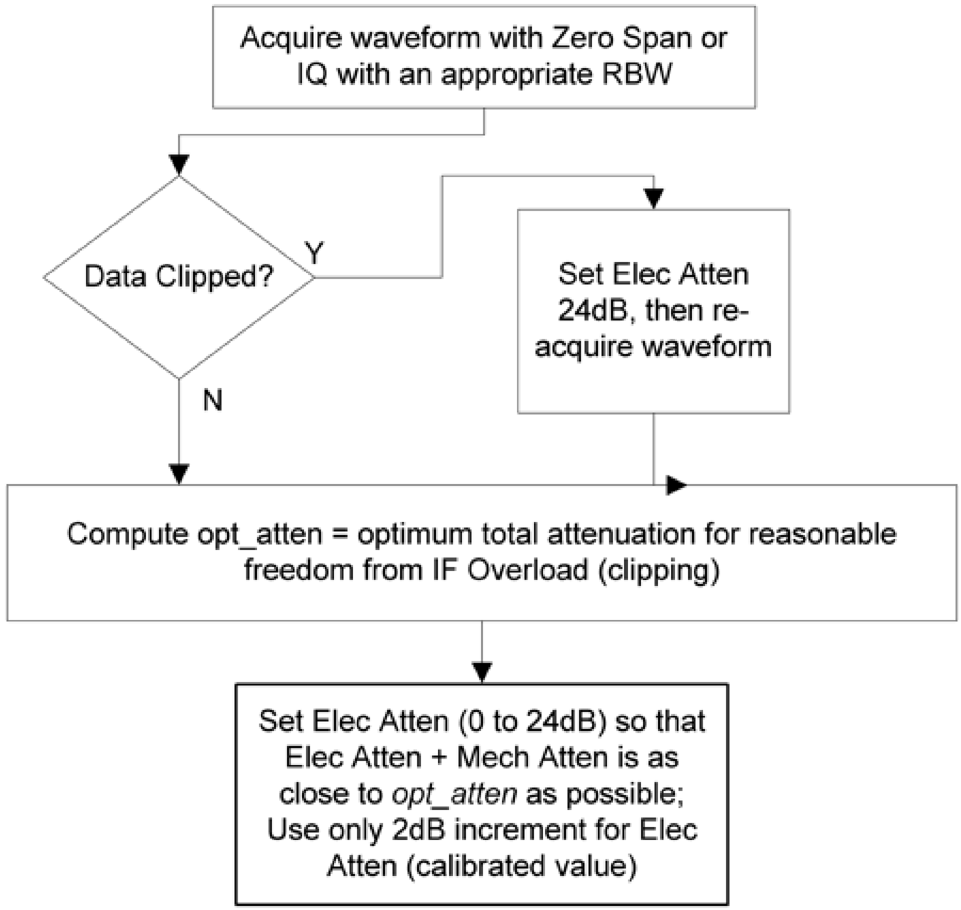
"Adjust Atten for Min Clipping" on page 1941 or "Pre-Adjust for Min Clipping" on page 576 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to opt_atten as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to opt_atten as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= opt_atten <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 576 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "Max Mixer Lvl Rules" on page 1948.

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real>` `[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?`
Example	`:POW:MIX:RANG -15 dBm` `:POW:MIX:RANG?`
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

`NORMal`	The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the Reference Level is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression with be negligible
`TOI`	Allows a range of settings of the "Max Mixer Level" on page 1947, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
`COMPression`	Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
`NORMal`	Normal – balance TOI, noise, and compression	–10	–50	0
`TOI`	TOI-limited dynamic range	–25	–50	–10
`COMPression`	Compression-limited dynamic range	–3	–10	+30

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal | TOI | COMPression` `[:SENSe]:POWer[:RF]:MIXer:RULEs?`
Example	`:POW:MIX:RULE:COMP`
Dependencies	Only appears in the Swept SA and RTSA measurements
Preset	`NORM`

3.3.3.3 Range (Non-attenuator models)

Only available for Keysight’s modular signal analyzers and certain other Keysight products, such as VXT

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

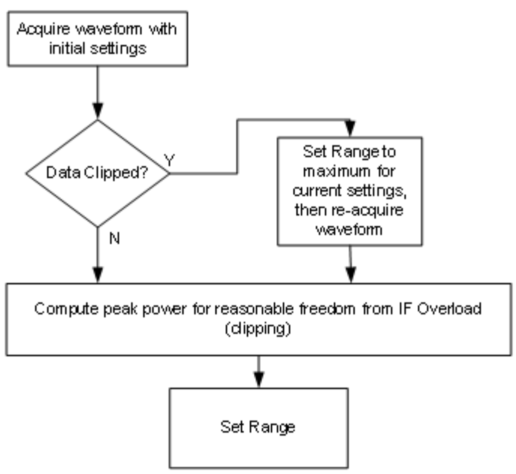
Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECtrical, COMBined, and ON) are honored and all are mapped to ELECtrical, so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1953 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	Does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument’s IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1955. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.3.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9421A, or UXM.

This tab *does* appear in VXT Models M9410A/11A, because "Software Preselection" on page 1971 is under this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1958 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 587.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed

	The offset applied to do the centering appears in "Preselector Adjust" on page 1958
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 1956 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`

Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1956, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for Low Band, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, **N/A** is displayed in the square brackets for Low Band.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL`
	`[:SENSe]:POWer[:RF]:GAIN:BAND?`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW`

	`OFF`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1959. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

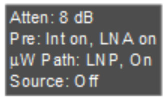
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 1959, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 590

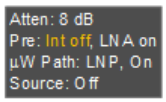
Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9421A/10A/11A May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	`OFF`
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the

input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	`:POW:MW:PATH STD`	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	`:POW:MW:PATH LNP`	See "Low Noise Path Enable" on page 595
µW Preselector Bypass	`:POW:MW:PATH MPB`	See "µW Preselector Bypass" on page 597
Full Bypass Enable	`:POW:MW:PATH FULL`	See "Full Bypass Enable" on page 598

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL` `[:SENSe]:POWer[:RF]:MW:PATH?`

Example	`:POW:MW:PATH LNP`
	Enables the Low Noise path
	`:POW:MW:PATH?`

Notes	If "Presel Center" on page 1956 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A, nor in BBIQ and External Mixing – The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed – The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed – The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”

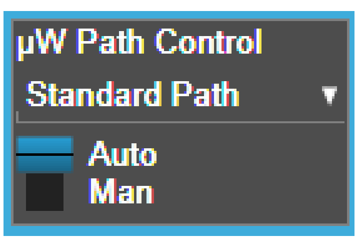
µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:



This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass

Measurement	When µW Path Control is in Auto
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and

Measurement	When µW Path Control is in Auto
	"Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

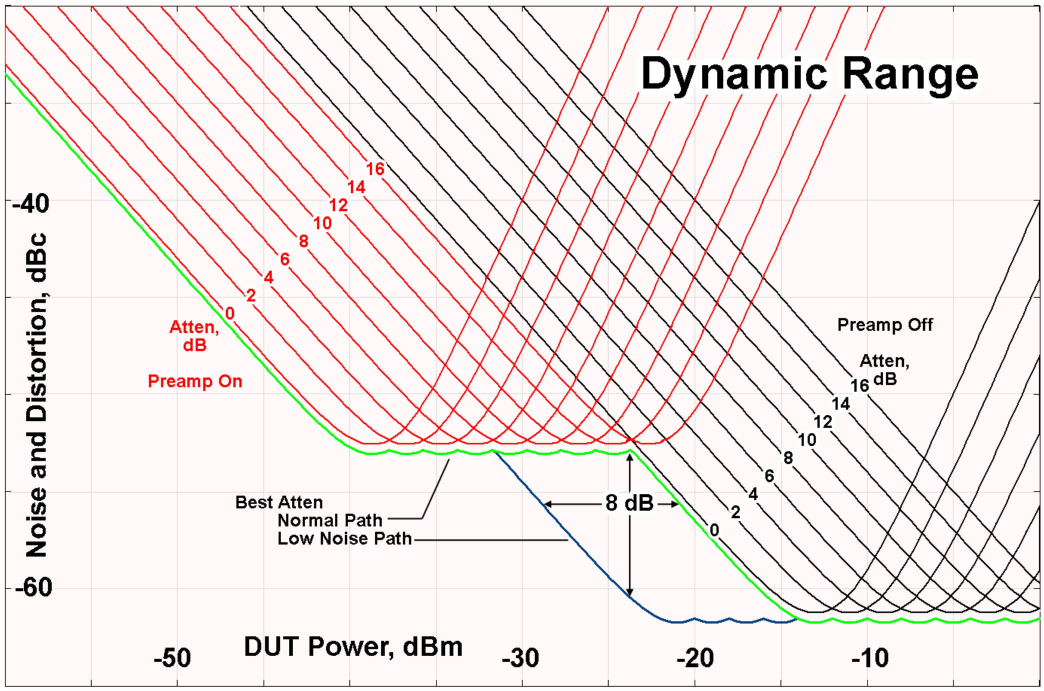
Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue

shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious

signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION When **Full Bypass Enable** is selected, and "Y Scale" on page 1929 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

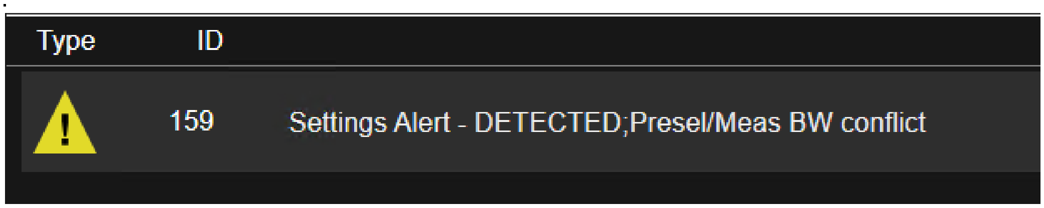
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection

Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as "max hold" or trace averaging) is performed on the points of both candidate traces before the "select minimum" operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is `OFF`. The grayout message is "Unavailable unless SW Presel enabled"
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied

bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)

– NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A, the parameter is SCPI-only, and always set to `NARRow` when **Software Preselection** is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in SA Mode:

	`:SAN:PFIL ON`
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See "Prefilter Presets" on page 604 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.3.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.3.4.1 Settings

Contains the basic bandwidth functions. In most measurements it is the only tab under Bandwidth.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (**Auto**) selects automatic coupling of **Res BW** to "Span" on page 624, using the ratio set by **Span:3 dB RBW** (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on **Res BW**, or simply enter a different value for **Res BW**.

When **Res BW** is manually selected, you can return it to the coupled state by pressing the **Auto/Man** toggle on **Res BW**. This may also be done by pressing "Auto Couple" on page 1995 or by performing a **Preset**.

For more details, see "More Information" on page 606

Remote Command	`[:SENSe]:CHPower:BANDwidth[:RESolution] <bandwidth>` `[:SENSe]:CHPower:BANDwidth[:RESolution]?`
Example	`:CHP:BAND 5 MHz` `:CHP:BAND?`
Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depend on the current bandwidth type
Couplings	Sweep time is coupled to RBW. As RBW changes, the sweep time (if set to **Auto**) is changed to maintain amplitude calibration Video bandwidth (VBW) is coupled to RBW. As the resolution bandwidth changes, the video bandwidth (if set to **Auto**) changes to maintain the ratio of VBW/RBW (10:1) When Res BW is set to **Auto**, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	See "RBW Presets" on page 606
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A “#” mark appears before “RBW” in the annotation when it is switched from Auto to Manual coupling

Backwards Compatibility Notes	For backwards compatibility, this command supports both the `BANDwidth` and `BWIDth` forms

Auto Function

Remote Command	`[:SENSe]:CHPower:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0` `[:SENSe]:CHPower:BANDwidth[:RESolution]:AUTO?`
Example	`:CHP:BAND:AUTO ON` `:CHP:BAND:AUTO?`

RBW Presets

Mode	Preset Value
LTEAFDD	Auto
LTEATDD	Auto
MSR	100 kHz
NR5G	Auto
SA	Auto
SRCOMMS	3.9 kHz
VMA	240 kHz
WCDMA	240 kHz
WLAN	100 kHz

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on "RBW Filter Type" on page 609.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on **Filter Type** or **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

In some PowerSuite measurements, in the LTE-Advanced (both FDD and TDD) and 5G NR modes, when **Res BW** is in **Auto**, the resolution bandwidth is predefined based on the corresponding bandwidth of the single carrier, as shown in the table below. In the Multi-carrier case, the narrowest RBW among the active carriers is used.

LTE-A FDD/TDD Modes

Carrier BW	Auto RBW, kHz
1.4 MHz	20
3 MHz	43

Carrier BW	Auto RBW, kHz
5 MHz	68
10 MHz	150
15 MHz	220
20 MHz	270
200 kHz (NB-IoT in FDD)	10

5G NR Mode

Bandwidth	Auto RBW, kHz
5 MHz	68
10 MHz	150
15 MHz	220
20 MHz	270
25 MHz	360
30 MHz	430
35 MHz	510
40 MHz	560
45 MHz	620
50 MHz	680
60 MHz	820
70 MHz	1000
80 MHz	1100
90 MHz	1300
100 MHz	1500
200 MHz	2700
400 MHz	3000
800 MHz	3000
1600 MHz	3000
2000 MHz	3000

Video BW

Lets you change the instrument post-detection filter (VBW or “Video Bandwidth”) from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by **VBW:3 dB RBW**. To decouple the resolution bandwidth, press the **Auto/Man** toggle on **Video BW**, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on **Video BW**. This may also be done by pressing "Auto Couple" on page 1995 or by performing a **Preset**.

Remote Command	`[:SENSe]:CHPower:BANDwidth:VIDeo <bandwidth>` `[:SENSe]:CHPower:BANDwidth:VIDeo?`
Example	`:CHP:BAND:VID 2.4 MHz` `:CHP:BAND:VID?`
Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean "wide open" The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed **Video BW** is not actually used to process the trace data: When the Average Detector is selected and **Sweep Type** is set to **Swept,** the video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, VBW still acts to change the Sweep Time, if "Sweep Time" on page 1085 is in **Auto**, and still affects the data on other traces for which this is not the case
Couplings	Video bandwidth (VBW) is normally coupled to "Res BW" on page 605. If **VBW** is set to **Auto**, then VBW is changed as RBW changes, to maintain the ratio set by **VBW:3 dB RBW** (usually 10:1 for measurements that do not have a **VBW:3 dB RBW** control)
Preset	Auto (unless noted in table below)
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A "#" mark appears before "VBW" in the annotation when it is not coupled
Annotation	In the bottom center of the screen, "VBW <value> <units>" indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility, this command supports both the `BANDwidth` and `BWIDth` forms

Auto Function

Remote Command	`[:SENSe]:CHPower:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0` `[:SENSe]:CHPower:BANDwidth:VIDeo:AUTO?`
Example	`:CHP:BAND:VID:AUTO OFF` `:CHP:BAND:VID:AUTO?`
Preset	`ON`

VBW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

Mode	Preset Value
WCDMA	2.40 MHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the Res BW filters in HP/Agilent/Keysight spectrum instruments were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its –3 dB points 10 MHz apart. In X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI Example
Gaussian	`:BAND:SHAP GAUS`
Flattop	`:BAND:SHAP FLAT`

Remote Command	`[:SENSe]:CHPower:BANDwidth:SHAPe GAUSsian | FLATtop` `[:SENSe]:CHPower:BANDwidth:SHAPe?`
Example	`:CHP:BAND:SHAP GAUS` `:CHP:BAND:SHAP?`
Notes	`GAUSsian`= Gaussian `FLATtop` = Flattop We use `SHAPe` instead of `TYPE` (even though the control name uses Type) because `TYPE` is used for backwards compatibility
Preset	"Auto Couple" on page 1995 selects the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:
Backwards	`[:SENSe]:CHPower:BWIDth:SHAPe`

–3 dB (Normal) filter BW	Res BW 300 Hz
–6 dB filter BW	Res BW (–6 dB) 422 Hz
Noise filter BW	Res BW (Noise) 317 Hz
Impulse filter BW	Res BW (Impulse) 444 Hz
CISPR filter BW	Res BW (CISPR) 200 Hz
MIL filter BW	Res BW (MIL) 1 kHz
Flattop filter type	Res BW (Flattop) 300 Hz

Compatibility SCPI	

3.3.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.3.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Bar Graph On/Off

Turns the Bar Graph On or Off.

Remote Command	`:DISPlay:CHPower:WINDow[1]:BGRaph ON | OFF | 1 | 0` `:DISPlay:CHPower:WINDow[1]:BGRaph?`
Example	`:DISP:CHP:WIND:BGR ON` `:DISP:CHP:WIND:BGR?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`ON|OFF`
Backwards Compatibility SCPI	`:DISPlay:CHPower:VIEW[1]:WINDow[1]:BGRaph`

3.3.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`

Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0 :DISPlay:ANNotation:TRACe[:STATe]?
Example	:DISP:ANN:TRAC OFF
Preset	OFF
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0 :DISPlay:ACTivefunc[:STATe]?
Example	:DISP:ACT OFF
Dependencies	Grayed out and forced to OFF when **System Display Settings**, **Annotation** is OFF
Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	:DISPlay:ANNotation:FREQuency[:STATe] ON | OFF | 1 | 0 :DISPlay:ANNotation:FREQuency[:STATe]?
Example	:DISP:ANN:FREQ OFF
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	ON

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When OFF, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1 :DISPlay:ANNotation:MBAR[:STATe]?
Example	:DISP:ANN:MBAR OFF
Dependencies	Grayed out and forced to OFF when **System Display Settings**, **Annotation** is OFF
Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending :SYSTem:DEFaults MISC or :DISPlay:ENABle ON (neither *RST nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending :SYSTem:DEFaults MISC or :DISPlay:ENABle ON (neither *RST nor :SYSTem:PRESet enable the display)
- and you are using either the :SYSTem:KLOCk command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is OFF, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SELect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SELect
Delete Screen	:INSTrument:SCReen:DELete
Delete All But This Screen	:INSTrument:SCReen:DELete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	:DISPlay:ENABle OFF | ON | 0 | 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does *not* change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.3.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 551.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote	:DISPlay:VIEW:ADVanced:SELect <alphanumeric>

Command	`:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME “Baseband”`

	Creates a new View named Baseband from the current View, and selects it as the current View
Notes	<alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <alphanumeric> name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via :DISP:ENAB OFF) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	:DISPlay:VIEW:ADVanced:REName <alphanumeric>
Example	:DISP:VIEW:ADV:REN "Baseband"
Notes	<alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the <alphanumeric> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via :DISP:ENAB OFF) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	:DISPlay:VIEW:ADVanced:DELete

Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views

If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1983), then query the list of available Views, the result is undefined

3.3.6 Frequency

Contains controls that allow you to control the frequency and channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by "Meas Preset" on page 643. For example, **Center Frequency** is the same for all measurements — it does not change as you change measurements.

3.3.6.1 Settings

Contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting **Center Frequency**, "Span" on page 624 is held constant.

The **Center Frequency** setting is the same for all measurements within a mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global Center

Frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Frequency** function sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz, and when you go back to the RF Input, **Center Frequency** will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

– "RF Center Freq" on page 622

– "Ext Mix Center Freq" on page 623

– "I/Q Center Freq" on page 623

– "Center Frequency Presets" on page 620

– "VXT Models with Radio Heads/CIU Frequency Range" on page 622

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	Set Center Frequency to 50 MHz:
	`:FREQ:CENT 50 MHz`
	Increment the Center Frequency by the value of CF Step:
	`:FREQ:CENT UP`
	Return the current value of Center Frequency:
	`:FREQ:CENT?`

Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: – For RF input, equivalent to `:FREQ:RF:CENT` – For I/Q input, equivalent to `:FREQ:IQ:CENT` – For External Mixer, equivalent to `:FREQ:EMIX:CENT` Preset and Max values depend on Hardware Options If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than frequency is used, an invalid suffix error message is generated
Dependencies	Not available in MSR, LTE-Advanced FDD/TDD and 5G NR Modes
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input

	See "Center Frequency Presets" on page 620 and "RF Center Freq" on page 622 and "Ext Mix Center Freq" on page 623 and "I/Q Center Freq" on page 623 and "VXT Models with Radio Heads/CIU Frequency Range" on page 622
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 620 and "RF Center Freq" on page 622 and "I/Q Center Freq" on page 623 and "VXT Models with Radio Heads/CIU Frequency Range" on page 622
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Sets the **Center Frequency** to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel *always* applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set **Center Frequency** such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	26.999999995 GHz See "Center Frequency Presets" on page 620. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on "Span" on page 624

Ext Mix Center Freq

Sets the **Center Frequency** to use when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel *always* applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all measurements in the Mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you will return to the settings that you had when you left External Mixing, so you will return to the band you were in, with the **Center Frequency** that you had. However, "Span" on page 624 is not an input-dependent parameter, so you will retain the span from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. **Center Frequency** thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited **Span** available to it, and cannot achieve the **Span** shown in the table (Span = Stop Freq – Start Freq), the instrument uses the maximum **Span** the measurement allows, and still sets **Center Frequency** to the midpoint of the Start and Stop Freq values in the Harmonic Table When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A values, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, following **Restore Input/Output Defaults**, if you go into External Mixing and do a Mode Preset while in Spectrum Analyzer Mode, the resulting **Center Frequency** is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on **Span**
Max	The maximum frequency in the currently selected mixer band – 5 Hz If the knob or step keys are being used, also depends on **Span**

I/Q Center Freq

Sets the **Center Frequency** to use when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each Mode and common across all measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min/Max	–/+40.049995 MHz

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting **Span**, **Center Frequency** is held constant, which means that both Start Frequency and Stop Frequency will change.

If **Span** is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

The default (and minimum) **Span** is calculated using the number of carriers and the carrier width where;

Span = (Upper Carrier Freq + (max offset IBW * (1 + alpha)) / 2) – (Lower Carrier Freq – (max offset IBW * (1 + alpha)) / 2)

If the RRC Filter is on, then span is increased by a factor of 1 + Filter Alpha.

See "Span Presets" on page 626

Remote Command	`[:SENSe]:CHPower:FREQuency:SPAN <freq>` `[:SENSe]:CHPower:FREQuency:SPAN?`
Example	`:CHP:FREQ:SPAN 10 MHz` `:CHP:FREQ:SPAN?`
Dependencies	If the electrical attenuator is enabled, any attempt to set Span such that the Stop Frequency would be >3.6 GHz results in an error In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in Continuous sweep, as there is a mechanical switch which bypasses the RF Preselector above 3.6 GHz. See the Stop Frequency control description for details of this limitation For MSR Mode, this control is not shown For WLAN 802.11ac (80 MHz + 80 MHz), the control is not enabled, and its value is coupled with the spacing between the center frequencies of the two carriers Span = | Center Frequency 1 – Center Frequency 2| + Integ BW + 40 MHz Margin

	When the calculated span is over 1 GHz, it is still coupled to its maximum value, which is 1 GHz
Couplings	**Span** affects "Res BW" on page 605, Sweep Time, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings) Any value of **Center Frequency** or **Span** that is within the frequency range of the instrument is allowed *when* the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed, to keep the Start and the Stop Frequencies within the instrument's frequency range When using the knob or the step up/down keys or the `UP` | `DOWN` keywords in SCPI, the value that is being changed, that is, **Center Frequency** or **Span**, is limited so that the other parameter is not forced to a new value When **Res BW** is set to **Auto**, the resolution bandwidth is auto-coupled to span. The ratio of span /RBW is approximately 106:1. When **Res BW** is set to **Man**, bandwidths are entered by the user, and these bandwidths are used regardless of other instrument settings Since **Span** is coupled to **Integ BW** in the factory default condition, if you change the Integ BW setting, the span setting changes by a proportional amount until a limit value is reached. However, the span can be individually set. The minimum value of the span is coupled with the integration bandwidth **Span** cannot be set less than the **Integ BW** value. When **Span** is changed, the ratio of Span/Integ BW is set, and retained when Integ BW is changed
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Span Presets" on page 626
State Saved	Saved in instrument state
Min	100 Hz In 5GNR, LTEAFDD, and LTEATDD Modes, this value is the minimum value required for the measurement, which depends on the Component Carrier configuration
Max	Depends on instrument maximum frequency, mode, measurement, and selected input. See "Span Presets" on page 626 If the knob or step keys are being used, depends on the value of the other three interdependent parameters Center Frequency, Start Frequency, Stop Frequency
Annunciation	Data out of range, value clipped to upper limit
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display

LTE, 5G NR Modes only:

Remote Command	`[:SENSe]:CHPower:FREQuency:SPAN:AUTO ON | OFF | 1 | 0` `[:SENSe]:CHPower:FREQuency:SPAN:AUTO?`
Example	`:CHP:FREQ:SPAN:AUTO OFF` `:CHP:FREQ:SPAN:AUTO?`
Notes	The span value is adjusted when the relevant carrier parameters such as bandwidth, integration bandwidth, number of component carriers etc., are changed, whatever the span state (**Auto** or **Man**) When in **Man** state, if the input value is less than the required sum of total integration bandwidths and gaps of the multi-carriers, the required span value is set
Dependencies	Only available in LTE/LTE-Advanced FDD/TDD Modes and 5G NR Mode, CHP measurement

Preset	ON
State Saved	Saved in instrument state
Range	Auto|Man

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	44.5 GHz
550	52 GHz
F06 (VXT models M9410A/11A)	5.75 GHz
F06 & EP6 (VXT models M9410A/11A)	6.27 GHz
F06 & LFE & EP6 (VXT models M9411A)	6.5999935 GHz
M9415A-F06	6.27 GHz
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Radio Std	Preset Value
SA		3 MHz
WCDMA		7.5 MHz
LTE		7.5 MHz
LTETDD		7.5 MHz
5G NR		150 MHz
WLAN	802.11a/g(OFDM/DSSS-OFDM)	30 MHz
	802.11b	37.5 MHz
	802.11n/ac/ax/be 20MHz	30 MHz
	802.11n/ac/ax/be 40MHz	60 MHz
	802.11n/ac/ax/be 80 MHz	120 MHz
	802.11n/ac/ax/be 160 MHz	240 MHz
	802.11n/ac/ax/be 80 MHz + 80 MHz	360 MHz
	802.11be 320 MHz	480MHz
	802.11be 160MHz + 160MHz	440MHz

CF Step

Changes the step size for **Center Frequency** and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>` `[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`

Example	`:FREQ:CENT:STEP 500 MHz`
	`:FREQ:CENT UP`
	increases the current center frequency value by 500 MHz
	`:FREQ:CENT:STEP?`

Notes	Preset and Max values depend on Hardware Options
Dependencies	If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning Not available in the MSR, LTE-A FDD/TDD and 5G NR Modes
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of ±27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of ±27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Auto Function

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1` `[:SENSe]:FREQuency:CENTer:STEP:AUTO?`
Example	`:FREQ:CENT:STEP:AUTO ON` `:FREQ:CENT:STEP:AUTO?`

Freq Offset

Enables you to set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument, including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a **Mode Preset**, or set the frequency offset to 0 Hz.

See "More Information" on page 629.

Remote Command	`[:SENSe]:FREQuency:OFFSet <freq>` `[:SENSe]:FREQuency:OFFSet?`
Example	`:FREQ:OFFS 10 MHz`

	:FREQ:OFFS?
Notes	Preset and Max values depend on Hardware Options
Dependencies	Appears only in Spectrum Analyzer Mode **Freq Offset** is not available in External Mixing. In this case the control is grayed-out and shows a value of zero. However, the value of CF Offset that was set for the RF Input is retained and restored when you switch back to the RF Input
Preset	See "Center Frequency Presets" on page 620
State Saved	Saved in instrument state
Min/Max	–/+500 GHz
Annotation	If Frequency Offset is not zero, “Freq Offset <value>” appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped
Backwards Compatibility SCPI	:DISPlay:WINDow[1]:TRACe:X[:SCALe]:OFFSet The DISPlay version of the command is in the instrument for compatibility across platforms and is not recommended for new development

More Information

This command does not affect any bandwidths, nor the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by Freq Offset. Changing the offset, even on a trace that is not updating, will immediately change all of the above, without taking new data.

NOTE If a trace is exported with a nonzero Freq Offset, the exported data will contain the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want Freq Offset to be 0, or the offset would be applied again to data which is already offset. No such care need be taken when saving a State+Trace file because the data and state are saved together.

Full Span (Remote Command Only)

Changes the span to show the full frequency range of the instrument. It maximizes the span within a range not changing the center frequency.

Remote Command	[:SENSe]:CHPower:FREQuency:SPAN:FULL

Example	`:CHP:FREQ:SPAN:FULL`
Couplings	Selecting full span changes the measurement span value

3.3.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

3.3.7.1 Select Marker

Specifies the *selected marker*. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. If you select a tab whose controls do *not* depend on the selected marker (for example, Counter), then this control is blanked.

For any menu that includes **Select Marker**, the first control is always **Marker Frequency**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal, Delta** and **Fixed** markers

3.3.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (**Normal**, **Delta**, or **Off**) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:X <freq>` `:CALCulate:CHPower:MARKer[1]|2|…|12:X?`
Example	`:CALC:CHP:MARK3:X 0` `:CALC:CHP:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is **Normal**, or the offset from the marker’s reference marker if the control mode is **Delta**. The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and Inverse Time, seconds for Period and Time
Preset	After a preset, all markers are turned OFF, so Marker X-Axis Value query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min/Max	–/+9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off,** but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta**, except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:X:POSition <real>` `:CALCulate:CHPower:MARKer[1]|2|…|12:X:POSition?`
Example	`:CALC:CHP:MARK10:X:POS 0` `:CALC:CHP:MARK10:X:POS?`
Notes	The query returns the marker’s absolute X-Axis value in trace points if the control mode is **Normal**, or the offset from the marker’s reference marker in trace points if the control mode is **Delta**. The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a marker is turned on, it is placed at the center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is **Off**, the response is Not A Number
Preset	After a preset, all markers are turned **Off**, so the query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min/Max	–/+9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y Axis value in the current marker Y-Axis unit.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:Y?`

Example	`:CALC:CHP:MARK11:Y?`
Notes	Returns the marker Y-Axis result if the control mode is **Normal** or **Delta** If the marker is **Off**, then the response is Not A Number
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:CHPower:MARKer[1]|2|…|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to `POSition` (**Normal**), `DELTa`, or `OFF`. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is `OFF`, pressing **Marker** sets it to `POSition` and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is `OFF`, there is no active function, and the active function is turned off.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:MODE POSition | DELTa | OFF` `:CALCulate:CHPower:MARKer[1]|2|…|12:MODE?`
Example	`:CALC:CHP:MARK3:MODE POS` `:CALC:CHP:MARK3:MODE?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is `OFF` to `ON` (1) puts it in `POSition` (**Normal**) mode and places it at the center of the screen.

Example	`:CALC:CHP:MARK3:STAT ON`

	`:CALC:CHP:MARK3:STAT?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:CALCulate:CHPower:MARKer[1]|2|…|12:STATe OFF | ON | 0 | 1` `:CALCulate:CHPower:MARKer[1]|2|…|12:STATe?`

Delta Marker (Reset Delta)

This control has exactly the same effect as pressing **Delta** in "Marker Mode" on page 632. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:CHPower:MARKer:AOFF`
Example	`:CALC:CHP:MARK:AOFF`

3.3.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with "Marker Delta" on page 634.

NOTE: Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 630 in the **Settings** tab.

Peak Search

Moves the selected marker to the trace point that has the maximum Y-Axis value for that marker's trace.

NOTE: Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:MAXimum`

Example	`:CALC:CHP:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. Following an unsuccessful search, the message "No peak found" is returned

Notes	Sending this command selects the subopcoded marker In W-CDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button has exactly the same effect as pressing **Delta** in "Marker Mode" on page 632 on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

3.3.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as "Marker Frequency" on page 630 in the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:REFerence <integer>` `:CALCulate:CHPower:MARKer[1]|2|…|12:REFerence?`
Example	`:CALC:CHP:MARK:REF 5` `:CALC:CHP:MARK:REF?`
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” When queried a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker’s reference marker makes the selected marker a **Delta** marker If the reference marker is **Off**, it is turned on in **Normal** mode at the delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then its default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults**. Not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by Marker Off, and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** or **Delta** markers.

Specifying a Marker Trace manually or with this command associates the marker with the specified trace. If the marker is not **Off**, it moves the marker from the trace it was on to the new trace. If the marker is **Off**, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|…|12:TRACe 1	2	3` `:CALCulate:CHPower:MARKer[1]|2|…|12:TRACe?`
Example	`:CALC:CHP:MARK2:TRAC 2` `:CALC:CHP:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by "Auto Couple" on page 1995 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. This is the same as "Marker Settings Diagram" on page 633 in the **Settings** tab.

3.3.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.3.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Number

Specifies the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep. After the specified number of average counts, the averaging mode (terminal control) setting determines the averaging action.

Remote Command	`[:SENSe]:CHPower:AVERage:COUNt <integer>` `[:SENSe]:CHPower:AVERage:COUNt?`
Example	`:CHP:AVER:COUN 15` `:CHP:AVER:COUN?`
Preset	SA, WLAN: 10 WCDMA, LTEAFDD, LTEATDD, 5G NR, MSR: 200
State Saved	Saved in instrument state
Min/Max	1 / 10000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format `n/N` where `n` is the current average and `N` is the average count

Averaging On/Off

Turns averaging on or off for this measurement.

NOTE In this measurement, the **Average Type** is preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:CHPower:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:CHPower:AVERage[:STATe]?`
Example	`:CHP:AVER ON` `:CHP:AVER?`
Preset	`ON`
State Saved	Yes
Range	`ON|OFF`

Avg Mode

Allows you to select the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached. Options are:

- `EXPonential`: The measurement averaging continues using the specified number of averages to compute each exponentially-weighted averaged value. The average is displayed at the end of each sweep
- `REPeat`: The measurement resets the average counter each time the specified number of averages is reached

Remote Command	[:SENSe]:CHPower:AVERage:TCONtrol EXPonential | REPeat [:SENSe]:CHPower:AVERage:TCONtrol?
Example	:CHP:AVER:TCON EXP :CHP:AVER:TCON?
Preset	EXP
State Saved	Yes
Range	EXPonential|REPeat

Integ BW

Specifies the range of integration used in calculating the power in the channel. The integration bandwidth (IBW) is displayed on the trace as two markers connected by an arrow.

Remote Command	[:SENSe]:CHPower:BANDwidth:INTegration <bandwidth> [:SENSe]:CHPower:BANDwidth:INTegration?
Example	:CHP:BAND:INT 10MHz :CHP:BAND:INT?
Dependencies	For LTE-Advanced FDD/TDD, 5G NR and MSR Modes, this control is not shown
Couplings	The minimum value of the span is coupled with Integ BW When you change Integ BW, the span changes accordingly by keeping the same ratio of Span/Integ BW
Preset	(see table below)
State Saved	Saved in instrument state

Preset:

Mode	Radio Std	Integ BW
SA		2 MHz
WCDMA		5 MHz
LTEAFDD, LTEATDD		5 MHz
WLAN	802.11a/g(OFDM/DSSS-OFDM)	20 MHz
	802.11b	25 MHz
	802.11n/ac/ax/be (20MHz)	20 MHz
	802.11n/ac/ax/be (40MHz)	40 MHz
	802.11n/ac/ax/be (80MHz)	80 MHz
	802.11ax/be (80 MHz + 80 MHz)	80 MHz
	802.11ac/ax/be (160 MHz)	160 MHz
	802.11be (160 MHz + 160MHz)	160 MHz
	802.11be (320MHz)	320 MHz

Min/Max	100 Hz / Hardware Maximum Span
Backwards Compatibility SCPI	`[:SENSe]:CHPower:BWIDth:INTegration`

PSD Unit

Sets the unit bandwidth for Power Spectral Density. The available units are dBm/Hz (DBMHZ) and dBm/MHz (DBMMHZ).

Remote Command	`:UNIT:CHPower:POWer:PSD DBMHZ | DBMMHZ` `:UNIT:CHPower:POWer:PSD?`
Example	`:UNIT:CHP:POW:PSD DBMMHZ` `:UNIT:CHP:POW:PSD?`
Couplings	When the PSD unit is changed, the response to `:MEAS|READ|FETCH:CHP1?` also changes by the PSD unit basis (either dBm/Hz or dBm/MHz)
Preset	WLAN mode or SA mode with WLAN radio standard: DBMMHZ Otherwise: DBMHZ
State Saved	Saved in instrument state
Range	dBm/Hz | dBm/MHz

IF Gain

Sets **IF Gain** to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Remote Command	`[:SENSe]:CHPower:IF:GAIN[:STATe] ON | OFF | 1 | 0` `[:SENSe]:CHPower:IF:GAIN[:STATe]?`
Example	`:CHP:IF:GAIN ON` `:CHP:IF:GAIN?`
Notes	ON = high gain OFF = low gain
Dependencies	The IF Gain controls (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the controls Not available in VXT model M9421A
Preset	OFF
State Saved	Saved in instrument state
Range	Low Gain | High Gain

Auto Function

Remote Command	[:SENSe]:CHPower:IF:GAIN:AUTO[:STATe] ON | OFF | 1 | 0 [:SENSe]:CHPower:IF:GAIN:AUTO[:STATe]?
Example	:CHP:IF:GAIN:AUTO ON :CHP:IF:GAIN:AUTO?
Couplings	Auto sets IF Gain to High Gain if the input attenuator is set to 0 dB, or if the preamp is turned on and the frequency range is under 3.6 GHz For other conditions, Auto sets IF Gain to Low Gain
Preset	OFF

Spur Avoidance

Because VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to "Disabled" (OFF).

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be negatively impacted.

Remote Command	[:SENSe]:CHPower:SAVoid[:STATe] ON | OFF | 0 | 1 [:SENSe]:CHPower:SAVoid[:STATe]?
Example	:CHP:SAV ON :CHP:SAV?
Dependencies	Only appears in VXT models M9410A/11A/15A
Preset	OFF
State Saved	Saved in instrument state
Range	ON|OFF

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 642 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple***does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	`:CONFigure:CHPower`
Example	`:CONF:CHP`

3.3.8.2 Meas Method

Allows you to choose between Integration Bandwidth and RRC Weighted methods of making the measurement, and to set certain other relevant parameters.

In MSR, LTE-A FDD/TDD and 5G NR Modes, this feature is not supported.

Meas Method

Selects either the Integration BW (`OFF`) or RRC Weighted (`ON`) methods. Selecting the RRC Weighted method turns the Root Raised Cosine (RRC) filter on. The a value (roll off) for the filter is set to the value of "RRC Filter Alpha" on page 643, and the RRC filter bandwidth is set to "RRC Filter BW" on page 644.

Remote Command	`[:SENSe]:CHPower:FILTer[:RRC][:STATe] OFF | ON | 0 | 1` `[:SENSe]:CHPower:FILTer[:RRC][:STATe]?`
Example	`:CHP:FILT OFF` `:CHP:FILT?`
Notes	This parameter is normally used when TETRA is selected as the Radio Std
Dependencies	For WLAN 802.11 ac (80 + 80 MHz), RRC Weighted is not supported
Preset	`OFF`
State Saved	Saved in instrument state
Range	Integration BW | RRC Weighted

RRC Filter Alpha

Inputs the alpha value for the Root Raised Cosine (RRC) filter.

Remote Command	`[:SENSe]:CHPower:FILTer[:RRC]:ALPHa <real>` `[:SENSe]:CHPower:FILTer[:RRC]:ALPHa?`
Example	`:CHP:FILT:ALPH 0.5` `:CHP:FILT:ALPH?`

Notes	This parameter is normally used when TETRA is selected as the Radio Std
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01 / 1.00

RRC Filter BW

Sets the Root Raised Cosine (RRC) filter bandwidth. Normally, the filter bandwidth is the same as the symbol rate of the signal.

Remote Command	`[:SENSe]:CHPower:FILTer[:RRC]:BANDwidth <real>` `[:SENSe]:CHPower:FILTer[:RRC]:BANDwidth?`
Example	`:CHP:FILT:BAND 10MHz` `:CHP:FILT:BAND?`
Notes	This parameter is normally used when TETRA is selected as the Radio Std
Preset	SA, WCDMA, LTE, LTETDD Modes: 3.84 MHz WLAN Mode: **Radio Std** / **Value** 802.11a/g (OFDM/DSSS-OFDM): 16.6 MHz 802.11b: 22 MHz 802.11n (20MHz): 17.8 MHz 802.11n (40MHz: 36.6 MHz
State Saved	Saved in instrument state
Min/Max	100 Hz / 100 MHz
Backwards Compatibility SCPI	`[:SENSe]:CHPower:FILTer[:RRC]:BWIDth`

3.3.8.3 Meas Standard

Contains controls that allow you to preset the PowerSuite measurements to conform to various communications standards.

Radio Standard Presets

Lets you specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which is a cascading list of standards. When you have the selected the desired Standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command	`[:SENSe]:RADio:STANdard[:SELect] NONE | JSTD | IS95a | IS97D | IS98D | GSM | W3GPP | C2000MC1 | C20001X | NADC | PDC | BLUEtooth | TETRa | WL802DOT11A | WL802DOT11B | WL802DOT11G | HIPERLAN2 | DVBTLSN | DVBTGPN | DVBTIPN | FCC15 | SDMBSE | UWBINDOOR | LTEB1M4 | LTEB3M | LTEB5M | LTEB10M | LTEB15M | LTEB20M | WL11N20M | WL11N40M | WL11AC20M | WL11AC40M | WL11AC80M | WL11AC160M | WL11AX20M | WL11AX40M | WL11AX80M | WL11AX160M | WL11BE20M | WL11BE40M | WL11BE80M | WL11BE160M | WL11BE320M | WL11AD2G | WL11AY2G16 | WL11AY4G32 | WL11AY6G48 | WL11AY8G64 | NR5GFR1B100M` `[:SENSe]:RADio:STANdard[:SELect]?`
Example	`:RAD:STAN NONE` `:RAD:STAN?`
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state

The **Radio** column in the table lets you specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station (BTS) settings, for all relevant PowerSuite measurements. The Device SCPI command has the same effect as a selection in the **Radio** column:

Remote Command	`[:SENSe]:RADio:STANdard:DEVice BTS | MS` `[:SENSe]:RADio:STANdard:DEVice?`
Example	`:RAD:STAN:DEV MS` `:RAD:STAN:DEV?`
Preset	`BTS`
State Saved	Saved in instrument state
Range	`BTS|MS`

Chart for Standard and Available Measurements

Note that not every measurement in Spectrum Analyzer Mode is available for every standard. The chart below describes which measurements are available for each Radio Standard.

For TOI or Harmonics measurements, *no* Radio Standards are available.

	Swept SA	CHP	OBW	ACP	CCDF	Burst Power	Spurious Emission	SEM	List Sweep
None	X	X	X	X	X	X	X	X	(X)
3GPP 5G NR	(X)	X	X	X	X			X	(X)
3GPP LTE	(X)	X	X	X	X			X	(X)

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules
TETRA	Command Example	:RAD:STAN TETR
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
	RRC Filter	On
	RRC Filter Alpha	0.35
FCC Part15 Subpart F	Command Example	:RAD:STAN FCC15

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

DVB-T L/SECAM/NICAM	Command Example	:RAD:STAN DVBTLSN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T G/PAL/NICAM	Command Example	:RAD:STAN DVBTGPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001

DVB-T I/PAL/NICAM	Command Example	:RAD:STAN DVBTIPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
S-DMB System E	Command Example	:RAD:STAN SDMBSE
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	:RAD:STAN GSM
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP W-CDMA	Command Example	:RAD:STAN W3GPP
	IBW	5 MHz
	Span	7.5 MHz
	RBW	240 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22
3GPP LTE 1.4 MHz	Command Example	:RAD:STAN LTEB1M4
	IBW	1.4 MHz
	Span	2.1 MHz
	RBW	Auto rules
	VBW	Auto rules

3GPP LTE 3 MHz	Command Example	:RAD:STAN LTEB3M
	IBW	3 MHz
	Span	4.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 5 MHz	Command Example	:RAD:STAN LTEB5M
	IBW	5 MHz
	Span	7.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 10 MHz	Command Example	:RAD:STAN LTEB10M
	IBW	10 MHz
	Span	15 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 15 MHz	Command Example	:RAD:STAN LTEB15M
	IBW	15 MHz
	Span	22.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 20 MHz	Command Example	:RAD:STAN LTEB20M
	IBW	20 MHz
	Span	30 MHz
	RBW	Auto rules
	VBW	Auto rules
cdma2000	Command Example	:RAD:STAN C20001X :RAD:STAN C2000MC1 :RAD:STAN? (Query always returns C20001X)
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules

IS-95A	Command Example	:RAD:STAN IS95
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
J-STD-008	Command Example	:RAD:STAN JSTD
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
NADC	Command Example	:RAD:STAN NADC
	IBW	32.8 kHz
	Span	49.2 kHz
	RBW	1.2 kHz
	VBW	Auto rules
PDC	Command Example	:RAD:STAN PDC
	IBW	21 kHz
	Span	31.5 kHz
	RBW	6.2 kHz
	VBW	Auto rules
IS-97D/98D	Command Example	:RAD:STAN IS97D :RAD:STAN IS98D :RAD:STAN IS95C :RAD:STAN? Query always returns `IS97D`
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24kHz
	VBW	Auto rules

Band Class (IS-97D/98D only)

The following function is only available when you have selected the standard: IS-97D/98D. It lets you select the band class.

Remote Command	`[:SENSe]:RADio:STANdard:BAND:CLASs BC0 | BC1` `[:SENSe]:RADio:STANdard:BAND:CLASs?`
Example	`:RAD:STAN:BAND:CLAS BC0` `:RAD:STAN:BAND:CLAS?`

Preset	BC0
State Saved	Saved in instrument state
Range	0 (800 MHz Band)|1 (1900 MHz Band)

Wireless Radio Standards

The table below lists the CHP settings and provides an example for each wireless Radio Standard.

WLAN 802.11a	Command Example	:RAD:STAN WL802DOT11A
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11g	Command Example	:RAD:STAN WL802DOT11G
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11b	Command Example	:RAD:STAN WL802DOT11B
	IBW	25 MHz
	Span	37.5 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11n 20 MHz	Command Example	:RAD:STAN WL11N20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11n 40 MHz	Command Example	:RAD:STAN WL11N40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules

WLAN 802.11ac 20 MHz	Command Example	:RAD:STAN WL11AC20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 40 MHz	Command Example	:RAD:STAN WL11AC40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 80 MHz	Command Example	:RAD:STAN WL11AC80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 160 MHz	Command Example	:RAD:STAN WL11AC160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 20 MHz	Command Example	:RAD:STAN WL11AX20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 40 MHz	Command Example	:RAD:STAN WL11AX40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 80 MHz	Command Example	:RAD:STAN WL11AX80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules

WLAN 802.11ax 160 MHz	Command Example	:RAD:STAN WL11AX160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 20 MHz	Command Example	:RAD:STAN WL11BE20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 40 MHz	Command Example	:RAD:STAN WL11BE40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 80 MHz	Command Example	:RAD:STAN WL11BE80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 160 MHz	Command Example	:RAD:STAN WL11BE160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 320 MHz	Command Example	:RAD:STAN WL11BE320M
	IBW	320 MHz
	Span	480 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ad 2 GHz	Command Example	:RAD:STAN WL11AD2G
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules

WLAN 802.11ay 2.16 GHz	Command Example	:RAD:STAN WL11AY2G16
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 4.32 GHz	Command Example	:RAD:STAN WL11AY4G32
	IBW	4.32 GHz
	Span	6.48 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 6.48 GHz	Command Example	:RAD:STAN WL11AY6G48
	IBW	6.48 GHz
	Span	9.72 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 8.64 GHz	Command Example	:RAD:STAN WL11AY8G64
	IBW	8.64 GHz
	Span	12.96 GHz
	RBW	1 MHz
	VBW	Auto rules
3GPP 5G NR 5G NR FR1 100MHz	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules

WLAN HiperLAN/2	Command Example	:RAD:STAN HIPERLAN2
	UWB Indoor	Command Example RAD:STAN UWBINDOOR
	Bluetooth	Command Example RAD:STAN BLUE

Packet Type (Bluetooth only)

The command below sets the packet type for the Bluetooth measurement

Remote Command	`[:SENSe]:RADio:STANdard:PACKet DH1 | DH3 | DH5` `[:SENSe]:RADio:STANdard:PACKet?`
Example	`:RAD:STAN:PACK DH1` `:RAD:STAN:PACK?`
Notes	The packet length is:

	DH1	366 µs
	DH3	1622 µs
	DH5	2870 µs
Preset	DH1	
State Saved	Saved in instrument state	
Range	DH1 | DH3 | DH5

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is `NONE`, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = [Offset Freq A] - 0.5*([Chan Integ BW] + [Ref BW])
2. Divide by 4.5. Call the result GuardbandGoalRBW

3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute AutoRBWGoal = min(IntegBWGoal, max(GuardbandGoalRBW, ChannelWidthGoalRBW))
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as `:CONF` allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to `NONE`.

Enable Non-Std Meas

Lets you specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to `NO`, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to `YES`, all measurements and standard selections are enabled, so you can select any combination.

NOTE **If you select an unavailable measurement or unavailable radio standard using the Enable Non-Std Meas control, the measurement results may not conform to the selected standard.**

Remote Command	`[:SENSe]:RADio:STANdard:EAMeas YES | NO` `[:SENSe]:RADio:STANdard:EAMeas?`
Example	`:RAD:STAN:EAM YES` `:RAD:STAN:EAM?`
Preset	`NO`
State Saved	Saved in instrument state
Range	`YES|NO`

3.3.8.4 Limits

Allows you to set up the test limit for channel power or power spectral density.

When DVB-T radio standard is selected in SA Mode, this functionality is disabled, and the input signal is instead compared against a pre-defined spectrum mask.

In LTE-A FDD/TDD and 5G NR Modes, this feature is not supported.

In MSR Mode, this feature is not supported, because the power of each carrier may be different.

Power Limit

If **Power Limit** state is ON, this setting is a threshold to determine whether the real measured channel power can be passed or not. If real measured channel power exceeds **Power Limit**, the channel power test fails, otherwise, it passes.

If **Power Limit** state is OFF, the channel power test always passes.

Remote Command	`:CALCulate:CHPower:LIMit:POWer <ampl>` `:CALCulate:CHPower:LIMit:POWer?`
Example	`:CALC:CHP:LIM:POW 16.00` `:CALC:CHP:LIM:POW?`
Notes	This parameter and PSD Limit can determine Pass/Fail criteria

Power Limit state	PSD Limit state	Result
ON	OFF	Pass if power test passes Fail if power test fails
ON	ON	Pass if both power test and PSD test pass Fail if either of power test or PSD test fails
OFF	ON	Pass if PSD test passes Fail if PSD test fails
OFF	OFF	Always Pass

For WLAN 802.11ac (80 MHz + 80 MHz), the power test and the PSD test are performed to both carriers, which means the power (or PSD) readouts of both carriers should be compared with the power (or PSD) limit individually, and the test passes only when *both* values are lower than the limit

Preset	16.00
State Saved	Saved in instrument state
Min/Max	–/+200.0

Auto Function

Remote Command	`:CALCulate:CHPower:LIMit:POWer:STATe OFF | ON | 0 | 1` `:CALCulate:CHPower:LIMit:POWer:STATe?`
Example	`:CALC:CHP:LIM:POW:STAT ON` `:CALC:CHP:LIM:POW:STAT?`

Preset	WLAN Mode: ON All other Modes: OFF
State Saved	Yes
Range	OFF|ON

PSD Limit

Power Spectral Density Limit.

If **PSD Limit** state is ON, **PSD Limit** is a threshold to determine whether the real measured PSD will pass or not. If real measured PSD exceeds PSD Limit, the test fails, otherwise, it passes.

If **PSD Limit** state is OFF, the test always passes.

Remote Command	`:CALCulate:CHPower:LIMit:PSDensity <real>` `:CALCulate:CHPower:LIMit:PSDensity?`
Example	`:CALC:CHP:LIM:PSD 4.00` `:CALC:CHP:LIM:PSD?`
Notes	This parameter and Power Limit can determine Pass/Fail criteria

Power Limit state	PSD Limit state	Result
ON	OFF	Pass if power test passes Fail if power test fails
ON	ON	Pass if both power test and PSD test pass Fail if either of power test or PSD test fails
OFF	ON	Pass if PSD test passes Fail if PSD test fails
OFF	OFF	Always Pass

For WLAN 802.11ac (80 MHz + 80 MHz), the power test and the PSD test are performed to both carriers. Which means the PSD (or power) readouts of both carriers should be compared with the PSD (or power) limit individually, and the test passes only when both values are lower than the limit

Couplings	The value is automatically converted when PSD Unit is changed
Preset	WLAN mode or SA mode with WLAN radio standard: 4.00 dBm/MHz Otherwise: 4.00 dBm/Hz
State Saved	Saved in instrument state
Min/Max	–/+200.0

Auto Function

Remote Command	`:CALCulate:CHPower:LIMit:PSDensity:STATe OFF | ON | 0 | 1`

	:CALCulate:CHPower:LIMit:PSDensity:STATe?
Example	:CALC:CHP:LIM:POW:STAT ON :CALC:CHP:LIM:POW:STAT?
Preset	WLAN Mode: ON All other Modes: OFF
State Saved	Yes
Range	OFF|ON

Power Limit Fail (Remote Query Only)

Queries whether a power test passes or fails. When DVB-T radio standard is selected in SA Mode, the result of this query has no meaning.

While implementing the scpi, don't try to remove the SCPI command from the SCPI tree when DVB-T is selected as current radio standard.

Remote Command	:CALCulate:CHPower:LIMit:POWer:FAIL?
Example	:CALC:CHP:LIM:POW:FAIL?
Notes	Query only When "Power Limit" on page 660 state is OFF, the returned value is always 0 (pass) When **Power Limit** state is ON, the returned value is 0 (pass) if power test passes and 1(fail) if power test fails

PSD Limit Fail (Remote Query only)

Queries whether PSD test passes or fails. When DVB-T radio standard is selected in SA Mode, the result of this query has no meaning.

While implementing the scpi, don't try to remove the SCPI command from the SCPI tree when DVB-T is selected as current radio standard.

Remote Command	:CALCulate:CHPower:LIMit:PSD:FAIL?
Example	:CALC:CHP:LIM:PSD:FAIL?
Notes	Query only When "PSD Limit" on page 661 state is OFF, the returned value is always 0 (pass) When **PSD Limit** state is ON, the returned value is 0 (pass) if PSD test passes and 1(fail) if PSD test fails

3.3.8.5 Advanced

Contains controls for setting advanced functions of the instrument.

Does not appear in VXT.

Phase Noise Optimization

Allows you to select the LO (local oscillator) phase noise behavior for various operating conditions. When in Auto, selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions.

For full details, see "Parameter Options, Installed Options & Ranges" on page 663 below.

Remote Command	`[:SENSe]:CHPower:FREQuency:SYNThesis[:STATe] 1 | … | 5`
	For the meaning of each numeric option value, see "Parameter Options, Installed Options & Ranges" on page 663 below
	`[:SENSe]:CHPower:FREQuency:SYNThesis[:STATe]?`

Example	`:CHP:FREQ:SYNT 1` `:CHP:FREQ:SYNT?`
Dependencies	Does not appear in all models. For models in which the control is not displayed, the SCPI command is accepted for compatibility, although no action is taken
Preset	3
State Saved	Saved in instrument state
Range	See "Ranges" on page 668 below

Auto Function

Remote Command	`[:SENSe]:CHPower:FREQuency:SYNThesis:AUTO[:STATe] OFF | ON | 0 | 1` `[:SENSe]:CHPower:FREQuency:SYNThesis:AUTO[:STATe]?`
Example	`:CHP:FREQ:SYNT:AUTO 1` `:CHP:FREQ:SYNT:AUTO?`
Preset	`OFF`

Parameter Options, Installed Options & Ranges

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 665	1	– In instruments with EP0, balances close-in phase noise with spur avoidance – In instruments without EP0 optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 665	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 666	3	Optimizes LO for tuning speed
"Best Close-in" on page 664	4 or 1*	– In instruments with EP0, emphasizes close-in phase noise performance without regard to spur avoidance – In instruments without EP0, this setting is accepted but no action is taken
"Best Spurs" on page 665	5	– In instruments with EP0, emphasizes spur avoidance over close-in phase noise performance – In instruments without EP0, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EP0 installation. See "Best Close-in" on page 664 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 666 is identical in effect to "Best Close-in" on page 664.

Best Close-in

Without option EP0

```
:FREQ:SYNT 1
```

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EP0

```
:FREQ:SYNT 4
```

In instruments with Option EP0, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 665 setting, parameter 1 selects "Balanced" on page 665 in EP0 instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 664, which is usually not as good a choice as "Balanced" on page 665.

Balanced

`:FREQ:SYNT 1`

In instruments with EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EP0, the LO is configured for better phase noise than the "Best Wide-offset" on page 665 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 664 case mostly within ±1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 665 case at better than –90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "Fast Tuning" on page 666 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "Best Spurs" on page 665. It is available with the "Fast Tuning" on page 666 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "Fast Tuning" on page 666 option, the settings for "Best Close-in" on page 664 are used if "Fast Tuning" on page 666 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EP0 Models with option EP0 have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz	"Balanced" on page 665
	Span > 114.1 MHz, *or* RBW > 800 kHz	"Fast Tuning" on page 666
	RBW > 290 kHz, *or* Span > 4.2 MHz	"Best Wide-offset" on page 665
	Other conditions	"Balanced" on page 665

Models with Option	Conditions	Selection
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, *or* RBW > 1.9 MHz, *or* Source Mode is set to "Tracking"	"Fast Tuning" on page 666
	Center frequency is < 195 kHz, *or* CF >= 1 MHz *and* Span <= 1.3 MHz *and* RBW <= 75 kHz	"Best Close-in" on page 664
	All other conditions	"Best Wide-offset" on page 665
EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 664; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	CF < 130 kHz , *or* CF > 12 MHz *and* Span < 495 kHz *and* RBW < 40 kHz	"Best Close-in" on page 664
	Span > 22 MHz, *or* RBW > 400 kHz, *or* CF ≤ 12 MHz *and* Span < 495 kHz *and* RBW < 23 kHz	"Fast Tuning" on page 666
	All other conditions	"Best Wide-offset" on page 665
EP4 (available in CXA for improved phase noise)	Span > 101 MHz *or* RBW > 1.15 MHz *or* Source Mode is set to "Tracking"	"Fast Tuning" on page 666
	CF is < 109 kHz *or* CF >= 4.95 MHz *and* Span <= 666 kHz *and* RBW < 28 kHz	"Best Close-in" on page 664
	All other conditions	"Best Wide-offset" on page 665
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 666 are actually the same as "Best Close-in" on page 664, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, *or* RBW > 250 kHz, *or* Source Mode is set to "Tracking"	"Fast Tuning" on page 666
	Center frequency is < 25 kHz, *or* CF >= 1 MHz *and* Span <= 141.4 kHz *and* RBW <= 5 kHz	"Best Close-in" on page 664
	All other conditions	"Best Wide-offset" on page 665

In all the above cases:

- The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP1	1	Best Close-in	[offset < 140 kHz]
	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]
EP2, EP3, EP5	1	Best Close-in	[offset < 70 kHz]
	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
EP4	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

Noise Floor Extension

Allows you to turn on/configure the Noise Floor Extension (NFE) function. Some Modes (such as Spectrum Analyzer Mode), support two states of NFE, Full and Adaptive. The `ON` state (in Modes which do not support Adaptive NFE) matches the `FULL` state (in Modes that *do* support Adaptive NFE).

In `ON` or `FULL` NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive

NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes which support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE **Noise Floor Extension has no effect unless the RF Input is selected, so it does nothing when External Mixing is selected.**

In Modes that support Adaptive NFE, the default state of NFE is Adaptive (`ON`). In Modes that do not support Adaptive NFE, the default state of NFE is `OFF`. Prior to the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was `OFF` for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from **On|Off** to **Full|Adaptive|Off**. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on or off was retained, and a new command was added to set the state to turn Adaptive On or Off:

- `[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes that support Adaptive NFE
- `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default = On
- `FULL` = `:CORRection:NOISe:FLOor ON` plus `:CORRection:NOISe:FLOor:ADAPtive ON`

See "More Information" on page 670

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, does not appear, but the SCPI command will be accepted without error but has no effect
Couplings	When NFE is enabled in any mode manually, a prompt will be displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled through SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by **Mode Preset**. Turned ON at startup and by **Restore Mode Defaults** in Modes that support Adaptive. Turned `OFF` at startup and by **Restore Mode Defaults** in Modes that do not support Adaptive
State Saved	No

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAptive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAptive?`

Example	Turn NFE ON (Full mode):
	`:CORR:NOIS:FLO ON`
	Set to Adaptive:
	`:CORR:NOIS:FLO:ADAP ON`

Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but has no effect)
Couplings	For backwards compatibility, sending `:CORR:NOIS:FLO ON` turns NFE Adaptive `OFF`. To turn Adaptive ON, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by **Mode Preset**, but set to ON at startup and by **Restore Mode Defaults**
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus instrument noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average, and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the instrument noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn’t smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging.

When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

"This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week"

If you **Cancel**, you will be prompted again the next time you turn NFE `ON`. If you **Postpone**, you will be prompted again after a week passes and you then turn NFE `ON`.

3.3.8.6 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "Global Center Freq" on page 2013) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to `ON`, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched `ON`, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is `ON`, modifies the **Global Center Freq**.

When **Global Center Freq** is switched `OFF`, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is `ON`, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL|NONE`

Preset	`OFF`
Backwards Compatibility SCPI	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`

Global EMC Std

When this control is switched `ON`, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is `ON` modifies the **Global EMC Std**.

When **Global EMC Std** is switched `OFF`, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is `ON`, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2016 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:EMC:STANdard ALL | NONE` `:INSTrument:COUPle:EMC:STANdard?`
Example	`:INST:COUP:EMC:STAN ALL` `:INST:COUP:EMC:STAN?`
Dependencies	Only available if Option EMC is installed
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Global Limit Lines (Freq and Amptd)

When this control is set to ALL, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use **Global Limit Lines**, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global** Settings, while **Global Limit Lines** is ALL, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to NONE, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is ALL, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to NONE when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:LLINe ALL | NONE` `:INSTrument:COUPle:LLINe?`
Example	`:INST:COUP:LLIN ALL | NONE` `:INST:COUP:LLIN?`
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	ALL | NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned ON, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to OFF when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`

Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON`|`OFF`

Restore Defaults

Resets all functions in the **Global** settings menu to `OFF`. Pressing **System**, **Restore Defaults**, **All Modes** has the same effect.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.3.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.3.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE Significantly faster sweep times are available with Option FS1.

NOTE The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument’s Sweep time equations, that is, the Auto Sweep Time. The instrument’s computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

NOTE On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement’s turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same “Sweep Time” as you would for sweeping hardware, send `[:SENSe]:<meas>:SWEep:TIME <time>`. The measurement emulates the “Sweep Time” effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.

Remote Command	`[:SENSe]:<meas>:SWEep:TIME <time>` `[:SENSe]:<meas>:SWEep:TIME?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME 25ms`
	`:CHP:SWE:TIME?`

Notes	In the ACP measurement in WCDMA Mode, this parameter is preset by **Meas Method** selection. Preset values are as follows: – IBW: 29 ms – IBWR: 108 ms – FAST 7.5 ms
Dependencies	On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time In those instruments, "Minimum Acquisition Time" on page 1087 is available
Couplings	Coupled to **Span**, **RBW**, **VBW**, and **Sweep Time Rules** when **Sweep Time** is set to Auto; **Sweep Time** changes when these parameters are changed When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically Calculated unless noted below WCDMA Mode – Channel Power: 1.0 msOBW: 32.6 ms – ACP: 29 ms

State Saved	Saved in instrument state
Min	Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when **Meas Method** is **Fast Power**, the minimum sweep time is span-dependent and automatically calculated
Max	Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) A "#" mark appears before "Sweep" in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register: `STATus:QUEStionable:INTegrity:UNCalibrated`

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:TIME:AUTO OFF | ON | 0 | 1` `[:SENSe]:<meas>:SWEep:TIME:AUTO?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME:AUTO OFF`
	`:CHP:SWE:TIME:AUTO?`

Preset	WCDMA Mode: `OFF` All others: `ON`

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each "chunk" of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

~(>~Minimum Acquisition Time) * (The number of chunks)

When in Auto, this parameter's value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time>`
	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`

Example	Channel Power measurement
	`:CHP:SWE:ACQ:TIME 500 ms`
	`:CHP:SWE:ACQ:TIME?`

Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to **Span**, **RBW**, and **VBW** when in the Auto state When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically calculated
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`

Example	Channel Power measurement: `:CHP:SWE:ACQ:TIME:AUTO OFF`
Preset	`ON`

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "More Information" on page 679

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`
Example	Put instrument into **Single** measurement operation: `:INIT:CONT 0`

	`:INIT:CONT OFF`
	Put instrument into **Continuous** measurement operation:
	`:INIT:CONT 1`
	`:INIT:CONT ON`

Preset	`ON` Note that `:SYST:PRES` sets `:INIT:CONT` to `ON`, but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is **Single** – A loop with an arrow is **Continuous**
Backwards Compatibility Notes	X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and `INIT:CONT ON`) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument keeps sweeping See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**
Single Mode	The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

– `:INIT:CONT 1` has no effect

– `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state

See "Restart" on page 2018 for details of `:INIT:IMMediate`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

– Pressing the **Restart** key

– Sending `:INIT:IMM`

– Sending `:INIT:REST`

See "More Information" on page 681

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` perform exactly the same function

Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **MaxHold** and **MinHold** traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k. This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N, as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K, shows the count for the sweep (data acquisition) in progress. K = k + 1, with a limit of N. The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** un-pauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If :`INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :`INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support this command
Status Bits/OPC dependencies	The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous

The STATus:QUEStionable register bit 9 (INTegrity sum) is cleared

Since all the bits that feed into OPC are cleared by :ABORt, the Abort command will cause the *OPC query to return true

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	`[:SENSe]:<meas>:SWEep:ETIMe?` `<meas>` is the identifier for the current measurement; any one of CHPower-|ACPower|OBWidth|MONitor
Example	Channel Power measurement `:CHP:SWE:ETIMe?`
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.3.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Time Rules

Switches the instrument between NORMal and ACCuracy sweep states.

Setting **Auto Sweep Time** to ACCuracy results in slower sweep times (usually about three times as long) but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to ACCuracy.

Additional amplitude errors that occur when **Auto Sweep Time** is set to NORMal are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, NORMal is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to NORMal on a **Preset**. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

Remote Command	`[:SENSe]:CHPower:SWEep:TIME:AUTO:RULes NORMal | ACCuracy`

	`[:SENSe]:CHPower:SWEep:TIME:AUTO:RULes?`
Example	`:CHP:SWE:TIME:AUTO:RUL NORM` `:CHP:SWE:TIME:AUTO:RUL?`
Dependencies	Does not appear in Spectrum Analyzer Mode in VXT model M9421A
Preset	`NORMal`
State Saved	Saved in instrument state
Range	`NORMal|ACCuracy`

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of **Points** is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument.Since markers are read at the point location, the marker reading may change.The sweep time resolution will change. Trace data for all the traces will be cleared and, if "Sweep/Measure" on page 2016 is **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Due to sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message is displayed, "Sweep points changed, all traces cleared."

Remote Command	`[:SENSe]:CHPower:SWEep:POINts <integer>` `[:SENSe]:CHPower:SWEep:POINts?`
Example	`:CHP:SWE:POIN 501` `:CHP:SWE:POIN?`
Dependencies	Not available when Signal ID is ON in External Mixing

	Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in Modes that do not support Swept
Couplings	Whenever the number of sweep points change: – All trace data is erased – Any traces with Update Off also switch to Display Off (equivalent to switching from View to Blank in older instruments) – Sweep time is re-quantized – Any limit lines that are on will be updated – If averaging/hold is on, averaging/hold starts over The resolution of setting the sweep time depends on the number of points selected
Preset	1001
State Saved	Saved in instrument state
Min/Max	101 / 100,001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	`[:SENSe]:SWEep:IF:DITHer OFF | ON | 0 | 1` `[:SENSe]:SWEep:IF:DITHer?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`OFF`
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	`[:SENSe]:SWEep:IMAGeprot OFF | ON | 0 | 1` `[:SENSe]:SWEep:IMAGeprot?`

Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	ON
State Saved	Saved in instrument state

3.3.10 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

3.3.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Dependencies	For the Swept SA measurement: – In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View – When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when **Meas Method** is `RBW`, `FAST` or `FPOWer`, **Select Trace** is disabled
Preset	Trace 1
State Saved	Yes

3.3.10.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 1905 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**

- Max Hold
- Min Hold

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display,** are described fully in the "View/Blank" on page 1721 control description. Essentially, when **Update** is `ON`, a trace is updating, and when **Update** is `OFF` it is not. When **Display** is `ON`, it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	`WRITe`	`:TRAC2:TYPE WRIT`	See: "Clear/Write" on page 691
Trace Average	`AVERage`	`:TRAC2:TYPE AVER`	See: "Trace Average" on page 691
Maximum Hold	`MAXHold`	`:TRAC3:TYPE MAXH`	See: "Max Hold" on page 692
Minimum Hold	`MINHold`	`:TRAC5:TYPE MINH`	See: "Min Hold" on page 692

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "View/Blank" on page 1721 state must be set to **Active** (**Update**: `ON`, **Display**: `ON`) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "Trace Mode Backwards Compatibility Commands" on page 689

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|…|6:TYPE?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|3:<meas>:TYPE?`
	where `<meas>` is the identifier for the current measurement

Example	`:TRAC:TYPE WRIT` `:TRAC:TYPE?`

Couplings	Selecting a **Trace Type** (by pressing any of the Trace Type selections or sending `:TRAC:TYPE`) sets the Trace to **Active** (**Update**: `ON`, **Display**: `OFF`), even if the same trace type was already selected When Detector setting is "Auto" (`[:SENSe]:<meas>:DETector:AUTO?)`, Detector (`[:SENSe]:<meas>:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: "`NORMal`" with `WRITe` (Clear Write), "`AVERage`" with `AVERage`, "`POSitive` (peak)" with `MAXHold`, and "`NEGative` (peak)" with `MINHold`
Preset	Swept SA and Monitor Spectrum: `WRITe` All other measurements: `AVERage` Following **Preset**, all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the "Trace Modes" were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "View/Blank" on page 1721.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The :`TRACe:MODE` command is retained for backwards compatibility, and the :`TRACe:TYPE`, :`TRACe:UPDate` and :`TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup**, **Legacy Compatibility** menu is `ON`, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	`WRITe`
State Saved	The trace mode is an alias only
Backwards	`:TRACe[1]|2|…|6:MODE WRITe | MAXHold | MINHold | VIEW | BLANk`

Compatibility SCPI	`:TRACe[1]|2|…|6:MODE?`
Backwards Compatibility Notes	The legacy `:TRACe:MODE` command is retained for backwards compatibility. In conjunction with the legacy `:AVErage` command, it works as follows: – `:AVErage ON|OFF` sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the `[:SENSe]:AVERage[:STATe]` command description below – `:TRACe:MODE WRITe` sets `:TRACe:TYPE WRITe` (Clear/Write) unless average is true, in which case it sets it to `:TRACe:TYPE AVErage`. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE BLANk` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANk`, the query response will not be what you sent `:TRACe[n]:MODE` was formerly used to set the type or “writing mode” of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold** As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does Also, previous to X-Series: – Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence – Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	`OFF`
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	`[:SENSe]:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:AVERage[:STATe]?`

Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command `[:SENSe]:AVERage [:STATe] ON|OFF|1|0` was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command `[:SENSe]:AVERage[:STATe] OFF|ON|0|1.` When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average, Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average, Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup.**

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like Center Frequency or Attenuation), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup.**

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold,** clears the trace , initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold,** clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1905 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

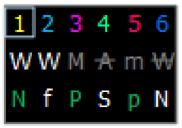
- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both `ON`
View	Update `OFF`; Display `ON`
Blank	Update `OFF`; Display `OFF`
Background	Update `ON`, Display `OFF` Allows a trace to be blanked *and* continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **Display**`OFF` is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **Update**`OFF` is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **Update**`OFF`, and Traces 4 and 6 have **Display**`OFF`.



See: "More Information" on page 695

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 694 and "Trace Display State On/Off" on page 695 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update `ON` and Display `ON`), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending `[:SENS]:DET:TRAC`) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that detector was already selected Selecting a "Math Function" on page 1724 other than `OFF` for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (**Update**`ON` and **Display**`ON`), even if that Math Mode was already selected Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:UPDate[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 2 inactive (stop updating): `:TRAC2:UPD 0`
Couplings	Whenever you set **Update** to `ON` for any trace, the **Display** is set to `ON` for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	`ON` for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`

	ON for Trace 1; OFF for 2 &3
State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:DISPlay[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 1 visible:
	`:TRAC2:DISP 1`
	Blank trace 3:
	`:TRAC3:DISP 3`

Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	ON for Trace 1; OFF for 2–6
	For all other measurements:
	`1|0|0`
	ON for Trace 1; OFF for 2 &3

State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display**=OFF) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

– if data is written to that trace from remote

– if trace data is loaded from mass storage

– if the trace is the target of a **Copy** or participant in an **Exchange**

– if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update**=`ON`), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display**=`OFF` and/or **Update**=`OFF` does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.3.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1730 controls.

– See "How trace math is processed" on page 700

Remote Command	For option details, see "Trace Math Options" on page 698
	For Swept SA Measurement (in SA Mode):
	`:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate:MATH? <trace_num>`
	where `<trace_num>` is any one of:
	`TRACE1|…|TRACE6`
	For all other measurements:
	`:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate[:<meas>]:MATH? <trace_num>`
	where:
	`<meas>` is the identifier for the current measurement, and
	`<trace_num>` is any one of:

	`TRACe1|TRACe2|TRACe3` Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
	Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB
	`:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
	Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm
	`:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0`
	Turns off trace math for trace 1

Notes	The Trace Math Function command has 6 main set of parameters:
	- Set 1 defines the “result trace”:
	`TRACE1|…|TRACE6`
	-Set 2 defines the “function”:
	`PDIFference|PSUM|LOFFset|LDIFference|OFF`
	- Set 3 is a “trace operand” (1):
	`TRACE1|…|TRACE6`
	- Set 4 is a “trace operand” (2):
	`TRACE1|…|TRACE6`
	- Set 5 defines the “Log Offset” (in dB)
	- Set 6 defines the “Log Difference Reference” (in dBm)
	Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function
	The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message
	The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas

Dependencies	Trace Math is not available if **Normalize** is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the

	function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = ON; and Update = ON

Preset	For Swept SA Measurement (in SA Mode):
	`OFF,TRACE5,TRACE6,0,0 | OFF,TRACE6,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0 | OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE4,0,0 | OFF,TRACE4,TRACE5,0,0`
	For all other measurements:
	`OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0`

State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An "f" is shown on the trace annunciation panel in the Measurement Bar when a math function is on; and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

```
DestinationTrace = FirstTrace + Offset
```

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = (FirstTrace - SecondTrace) + Reference
```

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

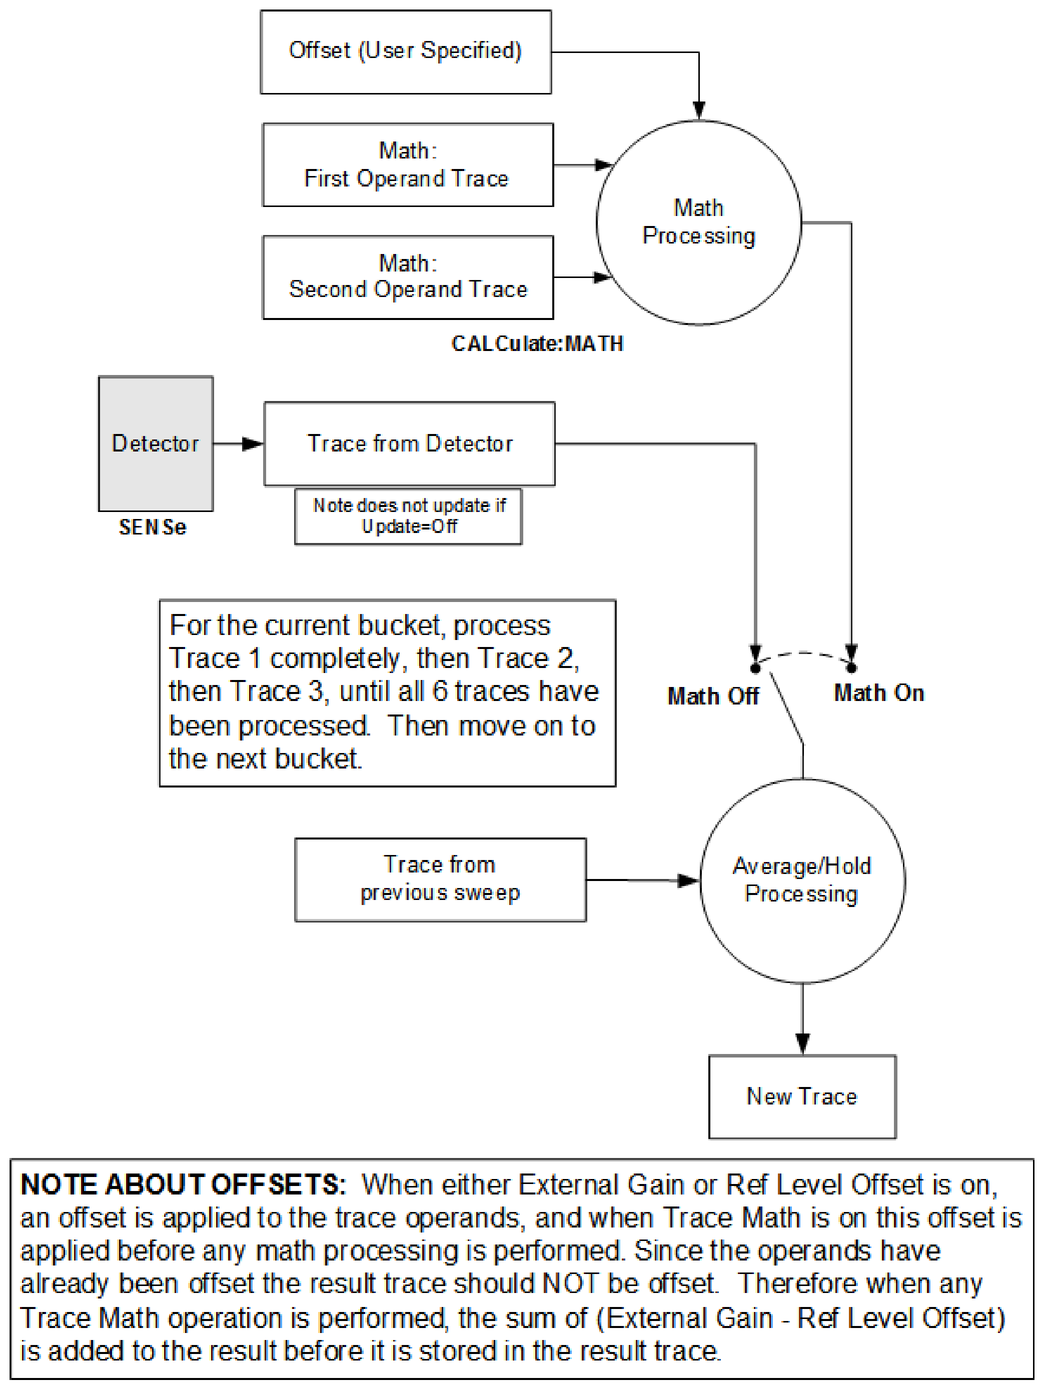
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement
	Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See "Math Function" on page 1724 for how to specify Operands 1 and 2 using `:CALCulate:MATH`
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the

	dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace 5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.3.10.4 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following choices are available:

Option	Parameter	Detector Behavior
Auto	n/a	The detector selected depends on marker functions, trace functions, average type, and the trace averaging function This option is set using "Detector Select Auto/Man" on page 705
Normal	`NORMal`	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
Average	`AVERage`	The detector determines the average of the signal within the sweep points, using RMS averaging
Peak (Positive)	`POSitive`	The detector determines the maximum of the signal within the sweep points
Sample	`SAMPle`	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
Negative Peak	`NEGative`	The detector determines the minimum of the signal within the sweep points
RMS	`RMS`	Equivalent to **Average**. See Notes below

Because they may not find a spectral component's true peak, neither **Average** nor **Sample** detectors measure amplitudes of CW signals as accurately as **Peak** or **Normal**, but they do measure noise without the biases of peak detection.

Remote Command	`[:SENSe]:CHPower:DETector[:FUNCtion] NORMal | AVERage | POSitive | SAMPle | NEGative | RMS` `[:SENSe]:CHPower:DETector[:FUNCtion]?`

Example	`:CHP:DET NORM`
	`:CHP:DET?`
	Set the detector to **Average**, which uses RMS averaging, so this is equivalent to selecting an `RMS` detector:
	`:CHP:DET RMS`

Notes	The query returns a name that corresponds to the detector type, as shown below The `RMS` selection sets the detector type to `AVERage` with `RMS` averaging. Therefore, if `RMS` has been selected, the query returns `AVER`

String Returned	Definition
`NORM`	Normal
`AVER`	Average (RMS)
`POS`	Peak
`SAMP`	Sample
`NEG`	Negative Peak

Couplings	When the **Detector** setting is **Auto**, switches to align with "Trace Type" on page 1905: – `NORMal` with Clear Write

	– AVERage with AVERage – POSitive (peak) with MAXHold – NEGative (peak) with MINHold
Preset	AVERage
State Saved	Saved in instrument state
Range	NORMal|AVERage|POSitive|SAMPle|NEGative|RMS

Detector Select Auto/Man

Sets the Detector mode to Auto or Manual. In Auto, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you select any detector explicitly, this setting switches automatically to Man (manual).

Remote Command	[:SENSe]:CHPower:DETector:AUTO ON | OFF | 1 | 0 [:SENSe]:CHPower:DETector:AUTO?
Example	:CHP:DET:AUTO ON :CHP:DET:AUTO?
Couplings	When the **Detector** setting is **Auto**, switches to align with "Trace Type" on page 1905: – NORMal with Clear Write – AVERage with AVERage – POSitive (peak) with MAXHold – NEGative (peak) with MINHold
Preset	ON
State Saved	Yes

3.3.10.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1732 when a "Copy" on page 1732 or "Exchange" on page 1733 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the "From Trace" on page 1732 when a "Copy" on page 1732 or "Exchange" on page 1733 is performed

Preset	2

Copy

Executes a Trace Copy based on the "From Trace" on page 1732 and "To Trace" on page 1732 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On `:TRAC:COPY TRACE1,TRACE3`
Notes	The command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1732 and "To Trace" on page 1732 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `:TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Exchange Trace 1 and Trace 2 and put both traces in Update=`OFF`, Display=`ON`: `:TRAC:EXCH TRACE1,TRACE2`
Notes	The command is of the form: `:TRACe:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in **View** (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = `OFF`.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.3.10.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a `:READ` or `:FETCh` query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:<meas>:MTRace TRACe1 | TRACe2 | TRACe3`
	`:CALCulate:<meas>:MTRace?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower | ACPower | OBWidth | SEMask | SPURious | PVTime`

Example	Channel Power
	`:CALC:CHP:MTR TRAC1`
	`:CALC:CHP:MTR?`

Dependencies	In the ACP measurement, this control is grayed-out when **Meas Method** is set to `RBW` or `FAST`, and only Trace 1 is enabled
Preset	`TRACe1`
State Saved	No
Range	Trace 1 | Trace 2 | Trace 3

3.4 Occupied BW Measurement

This measurement computes and displays the bandwidth occupied by a given percentage of the total mean power of a signal.

Measurement Commands

The general functionality of "CONFigure" on page 2732, "INITiate" on page 2733, "FETCh" on page 2733, "MEASure" on page 2735, and "READ" on page 2734 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

Note that, in general, `:CONF:<Measurement>` resets the specified measurement settings to their defaults. X-Series permits the addition of the `NDEFault` node to the command, which prevents a measurement preset after a measurement switch.

The tables below list setup commands for this measurement and queries to retrieve results.

Command	Function
`:INITiate:OBWidth`	Initiates a trigger cycle for the `OBW` measurement, but does not return any data. You must then use `:FETC:OBW[n]?` to retrieve data Does not change any measurement settings
`:CONFigure?`	Returns the long form name of current measurement, in this case, `OBWidth`
`:CONFigure:OBWidth`	Selects `OBW` measurement with Meas Setup settings in preset state – same as Meas Preset
`:CONFigure:OBWidth:NDEFault`	Selects `OBW` measurement *without* affecting settings

The following queries are used to retrieve data. The type of data returned depends on the value of `n`, as detailed in "Remote Command Results" on page 710.

Command	Function
`:FETCh:OBWidth[n]?`	Retrieves the data defined by `n`
`:MEASure:OBWidth[n]?`	Switches to `OBW` measurement, restores default values, starts the measurement, then retrieves the data defined by `n`
`:READ:OBWidth[n]?`	Starts the measurement, then retrieves the data defined by `n`

Backwards Compatibility Queries

Command	Return Value
`:FETCh:OBWidth:OBWidth?`	Returns the Occupied Bandwidth (Hz)
`:MEASure:OBWidth:OBWidth?`	
`:READ:OBWidth:OBWidth?`	

Command	Return Value

`:FETCh:OBWidth:FERRor?`
`:MEASure:OBWidth:FERRor?`
`:READ:OBWidth:FERRor?`
	Returns the Transmit Frequency Error (Hz)

`:FETCh:OBWidth:XDB?`
`:MEASure:OBWidth:XDB?`
`:READ:OBWidth:XDB?`
	Returns the xdB Bandwidth (Hz)

Remote Command Results

The following table describes the results returned by the `FETCh`, `MEASure`, and `READ` queries listed above, according to the index value `n`.

<table>
<tr><th>n</th><th>Results Returned</th></tr>
<tr><td>1, or not specified</td><td>Returns scalar results, in the following order:
<table>
<tr><th>#</th><th>Item</th><th>Unit</th></tr>
<tr><td>1</td><td>Occupied Bandwidth</td><td>Hz</td></tr>
<tr><td>2</td><td>Total Power or OBW Power
Power reference type can be changed with "Power Ref" on page 795 in Meas Setup</td><td>dBm</td></tr>
<tr><td>3</td><td>Span</td><td>Hz</td></tr>
<tr><td>4</td><td>Spectrum Trace Points</td><td>points</td></tr>
<tr><td>5</td><td>Res BW</td><td>Hz</td></tr>
<tr><td>6</td><td>Transmit Frequency Error</td><td>Hz</td></tr>
<tr><td>7</td><td>7. x dB Bandwidth</td><td>Hz</td></tr>
</table></td></tr>
<tr><td>2</td><td>Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 1</td></tr>
<tr><td>3</td><td>Only available in LTEAFDD, LTEATDD, 5GNR Modes
1. Number of active carriers
Returns number of active carriers within Span in Auto detected mode, otherwise the command is out of scope</td></tr>
<tr><td>4</td><td>Returns OBW Boundaries table results in the following order:
<table>
<tr><th>#</th><th>Item</th><th>Unit, if any</th></tr>
<tr><td>1</td><td>Occupied bandwidth</td><td>Hz</td></tr>
<tr><td>2</td><td>Total Power or OBW Power
Power reference type can be changed with "Power Ref" on page 795 in Meas Setup</td><td>dBm</td></tr>
</table></td></tr>
</table>

n	Results Returned		
	#	Item	Unit, if any
	3	x dB Reference Power	dBm
	4	x dB Reference Power Frequency - offset frequency	Hz
	5	x dB Reference Power Frequency – absolute frequency	Hz
	6	NaN (9.91E+37)	-
	7	NaN (9.91E+37)	-
	8	NaN (9.91E+37)	-
	9	Lower OBW boundary - offset frequency	Hz
	10	Lower OBW boundary - absolute frequency	Hz
	11	Lower OBW boundary - absolute power	dBm
	12	Lower OBW boundary - relative power	dBc
	13	Upper OBW boundary - offset frequency	Hz
	14	Upper OBW boundary - absolute frequency	Hz
	15	Upper OBW boundary - absolute power	dBm
	16	Upper OBW boundary - relative power	dBc
	17	Lower x dB BW boundary - offset frequency	Hz
	18	Lower x dB BW boundary - absolute frequency	Hz
	19	Lower x dB BW boundary - absolute power	dBm
	20	NaN (9.91E+37)	-
	21	Upper x dB BW boundary - offset frequency	Hz
	22	Upper x dB BW boundary - absolute frequency	Hz
	23	Upper x dB BW boundary - absolute power	dBm
	24	NaN (9.91E+37)	-
	Results 6, 7, 8, 20 and 24 always return NaN (9.91E+37)		
5	Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 2		
6	Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 3		

3.4.1 Views

This measurement has three predefined views:

Name	SCPI Name	SCPI #
"OBW Results" on page 712	OBWResults	1
"OBW Boundaries" on page 713	BOUNdaries	2

Name	SCPI Name	SCPI #
"Gate" on page 713	See "Gate View On/Off" on page 2665	

These are multiple-window views. When in a multiple-window view, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the **View** changes, the default menu is **Frequency**, unless otherwise specified in the **View** description.

The following SCPI commands can be used to select any view other than **Gate**.

View Selection by Name

Remote Command	`:DISPlay:OBWidth:VIEW[:SELect] OBWResults | BOUNdaries` `:DISPlay:OBWidth:VIEW[:SELect]?`
Example	`:DISP:OBW:VIEW OBWR` `:DISP:OBW:VIEW?`
Preset	`OBWResults`
State Saved	Saved in instrument state
Range	`OBWResults|BOUNdaries`

View Selection by Number

Remote Command	`:DISPlay:OBWidth:VIEW:NSELect <integer>` `:DISPlay:OBWidth:VIEW:NSELect?`
Example	`:DISP:OBW:VIEW:NSEL 2` `:DISP:OBW:VIEW:NSEL?`
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.4.1.1 OBW Results

Windows: "Graph" on page 713, "Metrics - OBW Results" on page 714

The spectrum trace is displayed in the upper window. Measurement results such as Occupied Bandwidth or Power are displayed in the lower window.

Example	`:DISP:OBW:VIEW OBWR`

3.4.1.2 OBW Boundaries

Windows: "Graph" on page 713, "Metrics – OBW Boundaries" on page 716

The spectrum trace is displayed in the upper window. The lower window of OBW Results view is replaced by the OBW boundaries table in this view. Occupied bandwidth and X dB bandwidth for both lower and upper boundaries are displayed.

Example	`:DISP:OBW:VIEW BOUN`

3.4.1.3 Gate

See "Gate View On/Off" on page 2665

3.4.2 Windows

There are four available window types. The **Gate** window is available only when "Gate View On/Off" on page 2665 is `ON` in the **Gate Settings** menu under **Trigger**.

View	#
"Graph" on page 713	1
"OBW Results" on page 712	2
"OBW Boundaries" on page 713	3
"Gate" on page 717	4

3.4.2.1 Graph

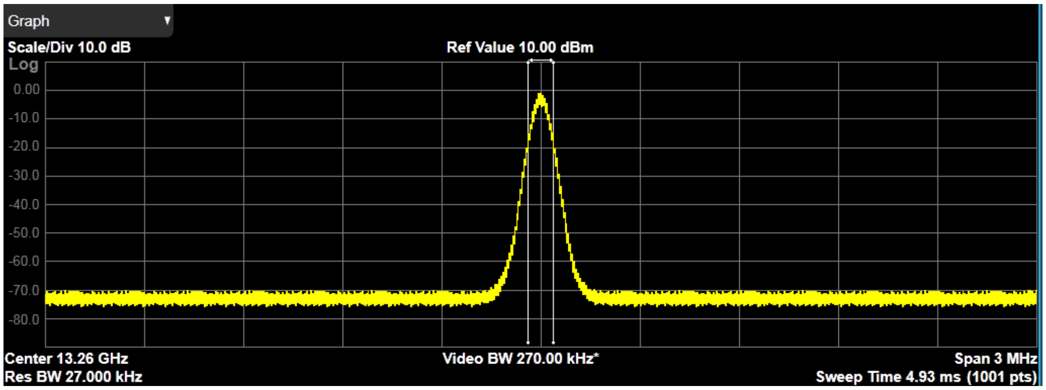
Window #1

Appears in two Views, as follows:

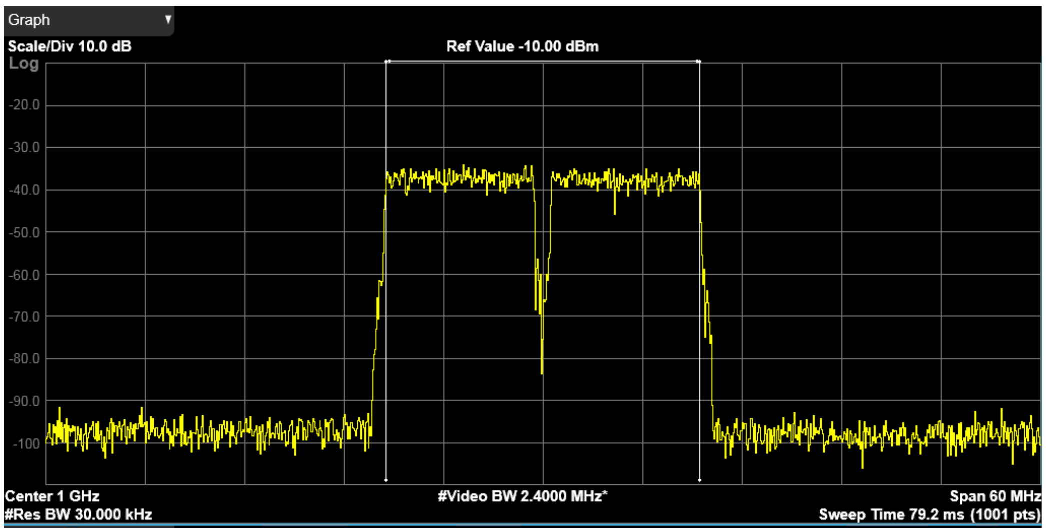
View	Size	Position
"OBW Results" on page 712	Three fifth, full width	Top
"OBW Boundaries" on page 713	Half, full width	Top

Spectrum View

For SA, WCDMA, WLAN mode:



For LTE-Advanced FDD/TDD mode only



3.4.2.2 Metrics - OBW Results

Window #2

Displays the textual results of the Occupied BW measurement.

View	Size	Position
"OBW Results" on page 712	Two fifth, full width	Bottom
Gate	One third, full width	Bottom

For the LTE-Advanced FDD/TDD and 5G NR modes, the metric result is shown as below:

Occupied Bandwidth

The occupied bandwidth result is $f_2 – f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with Occupied Bandwidth algorithms.

Total Power or OBW Power

The total power is the power integrated in the specified span setting. The OBW power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

Transmit Freq Error

The transmit freq error (transmit frequency error) result is calculated as the difference between $(f_2+f_1)/2$ and the tuned center frequency of the signal, where f_1 and f_2 are the lower and upper carrier boundary point.

x dB Bandwidth

The x dB result is a bandwidth measured between two points on the signal which are a certain number of dBs down from the highest signal point within the OBW Span. For example, If the ‘x dB’ parameter is set to –26 dB, and the ‘Occupied BW Span’ is set to 10 MHz, then the maximum signal power level is first determined from the 10 MHz wide trace sweep. Next, the two furthest frequencies below (xdb_f_1) and above (xdb_f_2) the frequency of the maximum level occurrence are found where the signal level is 26 dB below the peak level. This calculation also uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points).

The x dB bandwidth is calculated to be xdb_f2 – xdb_f1.

% of OBW Power

This is the setting parameter. See "% of OBW Power" on page 795

x dB

This is the setting parameter. See "x dB" on page 796.

Active Carriers

In the LTE-Advanced FDD/TDD and 5G NR modes, the number of active carriers is displayed to show how many carriers are identified as active in auto detected mode of span, otherwise “-” is displayed to indicate that it is out of scope. When there is one active carrier, Transmit Freq Error is displayed. Otherwise, “---“ is displayed.

Measure Trace

See "Measure Trace" on page 1734.

3.4.2.3 Metrics - OBW Boundaries

Window #3

Displays occupied bandwidth and X dB bandwidth for both lower and upper boundaries.

View	Size	Position
"OBW Boundaries" on page 713	Half, full width	Bottom
Gate	One third, full width	Bottom

Occupied Bandwidth

The occupied bandwidth result is $f_2 - f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with Occupied Bandwidth algorithms.

Total Power or OBW Power

Total Power is the power integrated in the specified span setting. OBW Power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

x dB

This is the setting parameter. See "x dB" on page 796.

x dB Ref Pwr

The x dB reference power result shows the power of the highest signal point within the OBW Span.

x dB At Freq

The x dB reference power frequency result shows the frequency of the highest signal point within the OBW Span. The frequency display type, either Offset or Absolute, can be selected with the Boundary Frequency control under Display.

OBW Boundary Results

Name	Unit	Corresponding Results
Lower OBW boundary - offset frequency	Hz	Offset frequency of the lower OBW boundary from center frequency
Lower OBW boundary - absolute power	dB	Absolute power on the point of lower OBW boundary
Lower OBW boundary - relative power	dBc	Relative power on the point of lower OBW boundary
Upper OBW boundary - offset frequency	Hz	Offset frequency of the upper OBW boundary from center frequency
Upper OBW boundary - absolute power	dB	Absolute power on the point of upper OBW boundary
Upper OBW boundary - relative power	dBc	Relative power on the point of upper OBW boundary
Lower x dB BW boundary - offset frequency	Hz	Offset frequency of the lower x dB BW boundary from center frequency
Lower x dB BW boundary - absolute power	dB	Absolute power on the point of lower x dB BW boundary
Upper x dB BW boundary - offset frequency	Hz	Offset frequency of the lower x dB BW boundary from center frequency
Upper x dB BW boundary - absolute power	dB	Absolute power on the point of lower x dB BW boundary

3.4.2.4 Gate

Window #4

Turning on **Gate** View shows the **Gate** Window, which lets you see your Gating signal at the same time as the measured data. See the description in "Gate View On/Off" on page 2665 under **Trigger**, **Gate Settings**.

Views in which this window appears:

View	Size	Position
Gate	One third, full width	Top

3.4.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.4.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:OBW:WIND:TRAC:Y:RLEV 125` `:DISP:OBW:WIND:TRAC:Y:RLEV?`
Couplings	When "Auto Scaling" on page 726 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to OFF "Attenuation" on page 1932 is not coupled to **Ref Value**
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:OBW:WIND:TRAC:Y:PDIV 5` `:DISP:OBW:WIND:TRAC:Y:PDIV?`
Couplings	Coupled to Scale Range as follows Scale/Div = Scale Range/10 (number of divisions) When the Auto Scaling is On, this value is automatically determined by the measurement result When you change a value, Auto Scaling automatically changes to Off
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	`:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision`

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace `<meas>` with the identifier for the current measurement
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl>`
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?`

Example	`:DISP:CHP:WIND:TRAC:Y:RANG 100` `:DISP:CHP:WIND:TRAC:Y:RANG?`
Couplings	Coupled to **Scale/Div** as follows **Scale Range** = **Scale/Div** * 10 (number of divisions) When you change this value, **Auto Scaling** automatically changes to `OFF`
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Y Axis Unit

Displays a dropdown menu that enables you to change the vertical (Y) axis amplitude unit. This setting affects how the data is read over the remote interface. When using the remote interface, only numerical values are returned, so you must know what the Y Axis Unit is to interpret the results. This is described in more detail in "Amplitude Data Query and Y Axis Unit" on page 722 below.

For measurements that support both Log and Lin scales, the instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales. For example, if Display Scale has been set to Log, and you set Y Axis Unit to dBm, pressing **Display Scale (Log)** sets the Y Axis Unit to dBm. If Display Scale has been set to Lin and you set Y Axis Unit to V, pressing **Display Scale (Lin)** sets the Y Axis Unit to V. Pressing **Display Scale (Log)** again sets the Y Axis Unit back to dBm.

If an Amplitude Correction is being applied that has an associated Transducer Unit, all selections but **Xducer Unit** are grayed-out. For more information, see "Transducer Unit" on page 723 below.

Remote Command	`:UNIT:POWer DBM | DBMV | DBMA | V | W | A | DBUV | DBUA | DBPW | DBUVM | DBUAM | DBPT | DBG` `:UNIT:POWer?`

Example	`:UNIT:POW dBmV`
	`:UNIT:POW?`
	See also "Remote Interface Examples" on page 721 below

Notes	The Y axis unit has either logarithmic or linear characteristics. The set of units that is logarithmic consists of dBm, dBmV, dBmA, dBmV, dBmA, dBmV/m, dBmA/m, dBpT, and dBG. The set of units that are linear consists of V, W, and A. The chosen unit will determine how the reference level and all the amplitude-related outputs like trace data, marker data, etc., read out
Dependencies	Appears only in Spectrum Analyzer Mode If an amplitude correction with a Transducer Unit other than None is applied and enabled: – The Transducer Unit selection is forced, and is the only Y Axis Unit available. The specific Transducer Unit is shown in square brackets in the dropdown, and all other Y Axis Unit choices are grayed-out – If you turn off that correction or set Apply Corrections to NO, the Y Axis Unit that existed before the Transducer Unit was applied is restored When Normalize is ON (in the **Trace**, **Normalize** menu), Y Axis Unit is grayed-out, and forced to dBm
Couplings	The instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales
Preset	dBm for log scale, V for linear. The true 'preset' value is dBm, since at preset the Y Display Scale is set to logarithmic
State Saved	Saved in instrument state
Annotation	The Y Axis Unit is shown after Ref Level value at the top of the graticule

Unit	Example	Notes
dBm	:UNIT:POW DBM	Y Axis Unit is set to dBm
dBmV	:UNIT:POW DBMV	Y Axis Unit is set to dBmV
dBmA	:UNIT:POW DBMA	Y Axis Unit is set to dBmA
W	:UNIT:POW W	Y Axis Unit is set to W
V	:UNIT:POW V	Y Axis Unit is set to V
A	:UNIT:POW A	Y Axis Unit is set to A
dBmV	:UNIT:POW DBUV	Y Axis Unit is set to dBmV
dBmA	:UNIT:POW DBUA	Y Axis Unit is dBmA. The unit dBuA can also appear as a Transducer Unit
dBpW	:UNIT:POW DBPW	Y Axis Unit is set to dBpW

Remote Interface Examples

Command examples and details appear in the table below. Note that each of the commands below sets the amplitude unit only for the *selected* amplitude scale (Log or Lin), the other scale is unaffected.

Unit	Example	Notes
dBm	:UNIT:POW DBM	dB relative to one milliwatt
dBmV	:UNIT:POW DBMV	dB relative to one millivolt
dBmA	:UNIT:POW DBMA	dB relative to one milliamp
W	:UNIT:POW W	Watts
V	:UNIT:POW V	Volts
A	:UNIT:POW A	Amperes
dBmV	:UNIT:POW DBUV	dB relative to one microvolt
dBmA	:UNIT:POW DBUA	dB relative to one microamp The unit dBuA can also appear as a "Transducer Unit" on page 723 When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA transducer unit. If :CORR:CSET:ANT? returns NOC (for No Conversion), you are using a normal Y Axis dBuA. If it returns UA, you are using a Transducer Unit dBuA
dBpW	:UNIT:POW DBPW	dB relative to one picowatt
dBmV/m	:UNIT:POW DBUVM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmV/meter. This selection is only available if a Correction is turned on, and the Transducer Unit

Unit	Example	Notes
(Transducer Unit)		for that Correction is not None See "Transducer Unit" on page 723
dBmA/m (Transducer Unit)	`:UNIT:POW DBUAM`	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 723
dBpT (Transducer Unit)	`:UNIT:POW DBPT`	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBpT (dB relative to one picotesla). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 723
dBG (Transducer Unit)	`:UNIT:POW DBG`	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBG (dB relative to one Gauss). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 723
dBmA (Transducer Unit)	`:UNIT:POW DBUA`	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA. This selection is only available as a Transducer Unit if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 723 The unit dBuA can also appear as a normal Y Axis Unit (see above) dBuA as a Transducer Unit is used when using current probes, because current probes are often supplied with conversion tables that provide the transducer factors. When dBuA is used as a Transducer Unit, the normal conversion from power to amps for dBuA (based on the instrument input impedance) is not done, but instead the conversion is based solely on the Correction that contains the transducer factors. This is what distinguishes dBuA as a normal unit from dBuA as a transducer unit When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA Transducer Unit. If `:CORR:CSET:ANT?` returns `NOC` (for No Conversion), you are using a normal Y-Axis dBuA. If it returns `UA`, you are using a Transducer Unit dBuA

Amplitude Data Query and Y Axis Unit

The settings of Y-Axis Unit and Display Scale affect how the data is returned over the remote interface in response to a query. When using the remote interface, no unit is returned, so you must know what the Y-Axis unit is to interpret the results:

Example 1

Set the following:

- Display Scale (Log)
- Y Axis Unit, dBm
- Scale/Div, 1 dB
- Ref Level, 10 dBm

This sets the top line to 10 dBm with each vertical division representing 1 dB. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 5 dBm and will read out remotely as 5.

Example 2

Set the following:

- Display Scale (Lin)
- Y Axis Unit, Volts
- Ref Level, 100 mV (10 mV/div)

This sets the top line to 100 mV and the bottom line to 0 V, so each vertical division represents 10 mV. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 50 mV and will read out remotely as 50.

NOTE **The units of current (A, dBmA, dBuA) are calculated based on 50 Ω input impedance.**

Transducer Unit

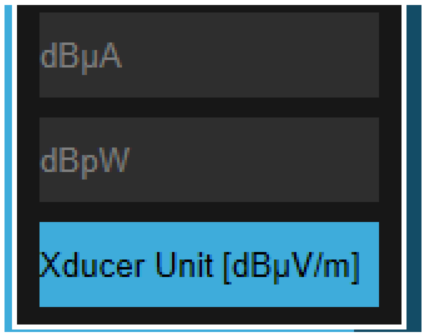
Transducer Units (formerly called Antenna Units) are units of field strength rather than amplitude, and are used when correcting the response of device such as antennas whose amplitude characteristics are measured in units of field strength. All five of the Transducer Units (dBmA/m, dBmV/m, dBG, dBpT, dBmA) are treated by the instrument exactly as though they were dBmV, when uncorrected. You must load an appropriate correction factor using Input/Output, Corrections for accurate and meaningful results.

If a remote command is sent to the instrument that uses one of the Transducer Units as a terminator, the instrument treats it as though DBUV had been sent as the terminator.

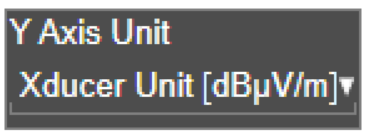
When a Correction is turned on that uses a Transducer Unit, the Y Axis Unit changes to that Transducer Unit. All of the selections in the **Y-Axis Unit** dropdown are then grayed-out, except the Transducer Unit selection. The unit being used is shown on this selection in square brackets, and appears on the control in square brackets preceded by **Xducer Unit**.

Example:

If the Transducer Unit in the Correction is dBmV/m, then the selection in the dropdown looks like this:



And on the control it looks like this:



NOTE

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output**, **Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output**, **Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

The Transducer Units are:

Units	Example
dBmV/m	:UNIT:POW DBUVM
dBmA/m	:UNIT:POW DBUAM
dBpT	:UNIT:POW DBPT
dBG	:UNIT:POW DBG
dBmA	:UNIT:POW DBUA
None	n/a

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off (AUTO) switch turns **Ref Level Offset** on or off. Setting a value for **Ref Level Offset** turns AUTOOFF.

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet <rel_ampl>`
	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet?`
	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?`

Example	Set **Ref Level Offset** to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB is assumed:
	`:DISP:WIND:TRAC:Y:RLEV:OFFS 12.7`
	`:DISP:WIND:TRAC:Y:RLEV:OFFS?`
	Turn **Ref Level Offset**AUTOON:
	`:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON`

Dependencies	Appears only in Spectrum Analyzer Mode
Preset	0 dBm OFF
State Saved	Saved in instrument state
Min	Variable. Limited to values that keep the reference level within the range of -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as “Ref Offset <value>” to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom` `:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?`
Example	`:DISP:OBW:WIND:TRAC:Y:RPOS CENT` `:DISP:OBW:WIND:TRAC:Y:RPOS?`
Preset	TOP
State Saved	Saved in instrument state
Range	TOP|CENTer|BOTTom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the

	Reference Position
Backwards Compatibility SCPI	:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON :DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPle?
Example	:DISP:OBW:WIND:TRAC:Y:COUP OFF :DISP:OBW:WIND:TRAC:Y:COUP?
Couplings	When **Auto Scaling** is ON, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change a value of "Scale/Div" on page 718, "Ref Value" on page 718, or "Scale Range" on page 1538, **Auto Scaling** automatically changes to OFF
Preset	1
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle

3.4.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 727
- See "Single-Attenuator Configuration" on page 727

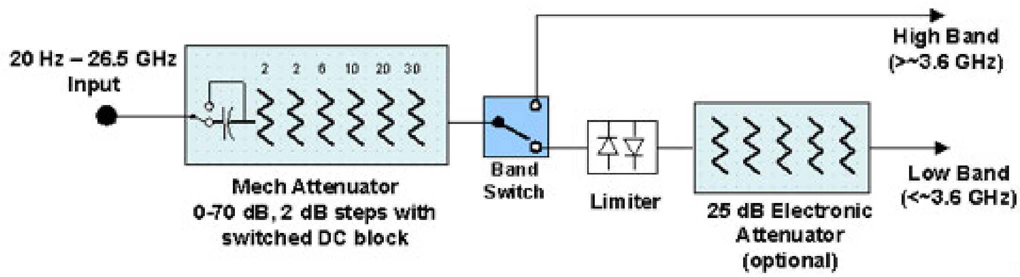
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9421A/10A/11A, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

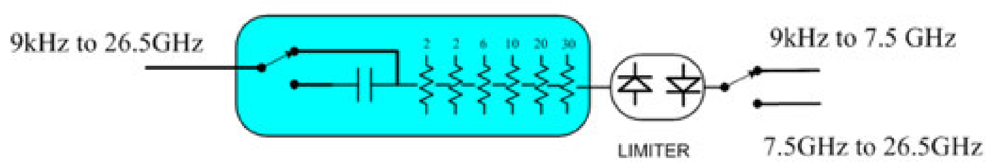
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

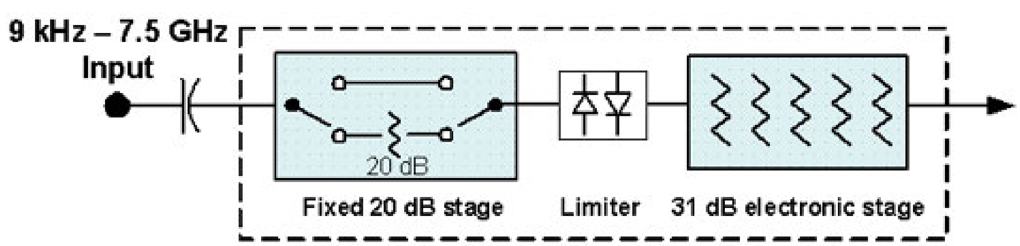


Configuration 2: Mechanical attenuator, no optional electronic attenuator



Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator **Single Attenuator**

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 1935 command descriptions
Preset	20 dB

State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: – If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten In the **Amplitude**, "Y Scale" on page 1929 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows: "Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 731

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20` Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main"

	attenuation) In either case, if the attenuator was in Auto, it is set to Manual `:POW:ATT:AUTO ON` Turn Auto Mech Atten ON
Dependencies	Some measurements do not support Auto setting of "Mech Atten" on page 729. In these measurements, the **Auto/Man** selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1937 See "Attenuator Configurations and Auto/Man" on page 731 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 729 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting will be changed to a multiple of 10 dB which will be no smaller than the previous setting. For example, 4 dB attenuation will be changed to 10 dB
Preset	The preset for Mech Attenuation is "Auto" The Auto value of attenuation is 10 dB `ON`
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased

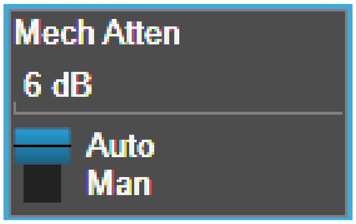
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: A: 24 dB (e14) Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described under "Y Scale" on page 1929, there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 729 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation.

See "Elec Atten" on page 1937 for more about “soft” attenuation.

NOTE **In some measurements, the Mech Atten control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the Mech Atten control:**



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details about the Electronic Attenuator, see "More Information" on page 734

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation’s specification is defined only when Mechanical Attenuation is 6 dB

Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no “electronic attenuator”; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a “soft” attenuation. The “soft” attenuation is treated as an addition to the “main” attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar The electronic attenuator, and the “soft” attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 1959 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 1960 is `ON`, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 734
Preset	0 dB `OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set

	to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 735 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1937

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled

- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1942.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in 5G NR Mode only

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in 5G NR Mode only
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1941 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 738

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECtrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

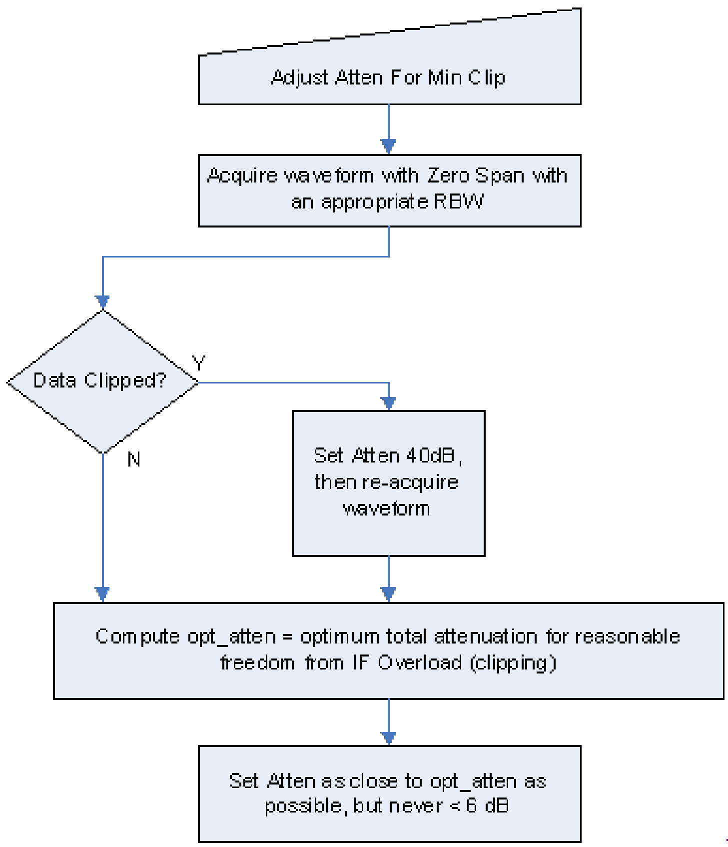
Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 1937 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 736 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, available only in 5G NR Mode
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

Notes	ON aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) OFF aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not OFF
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

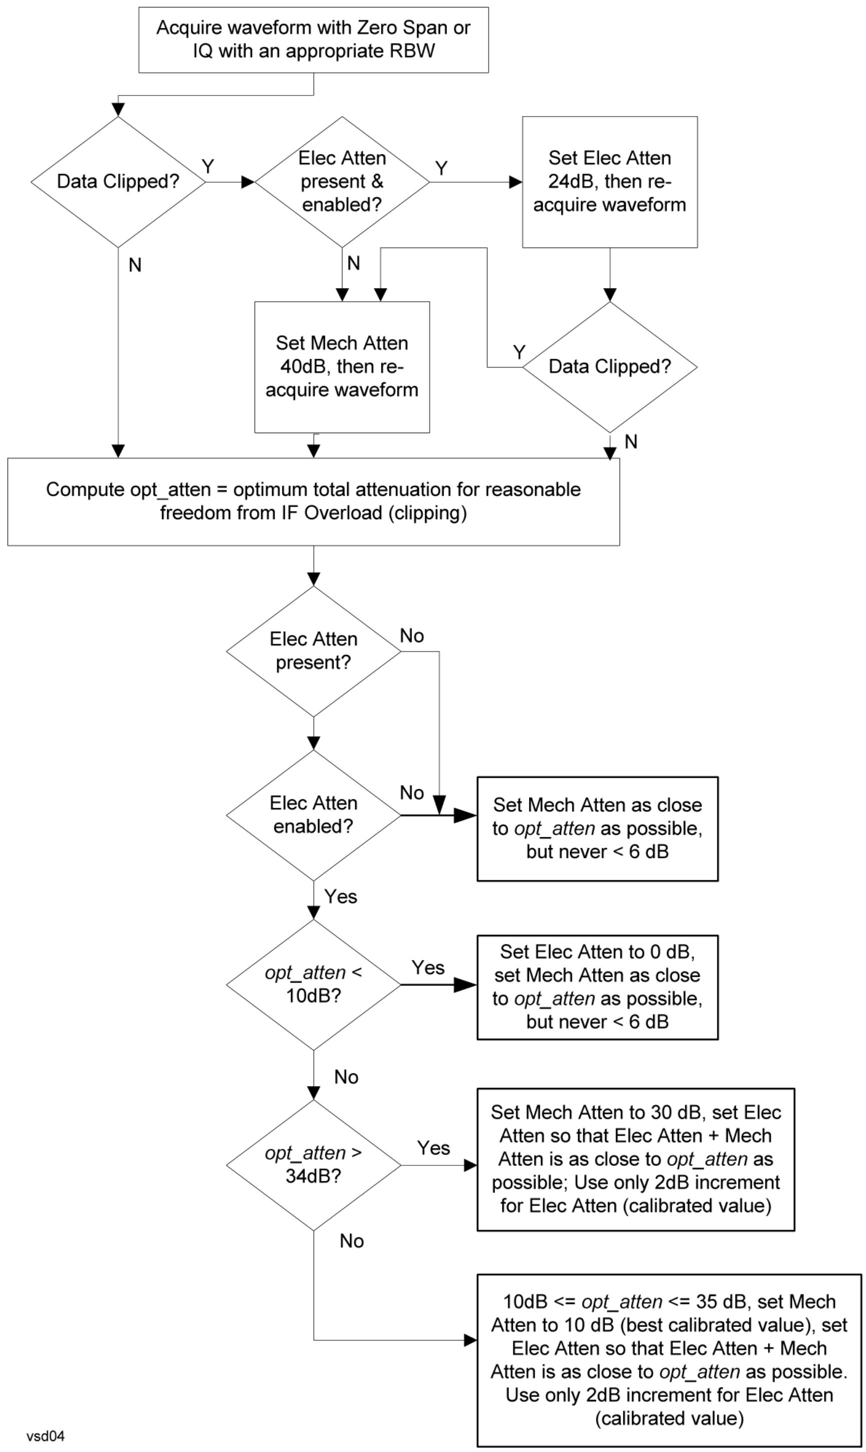
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

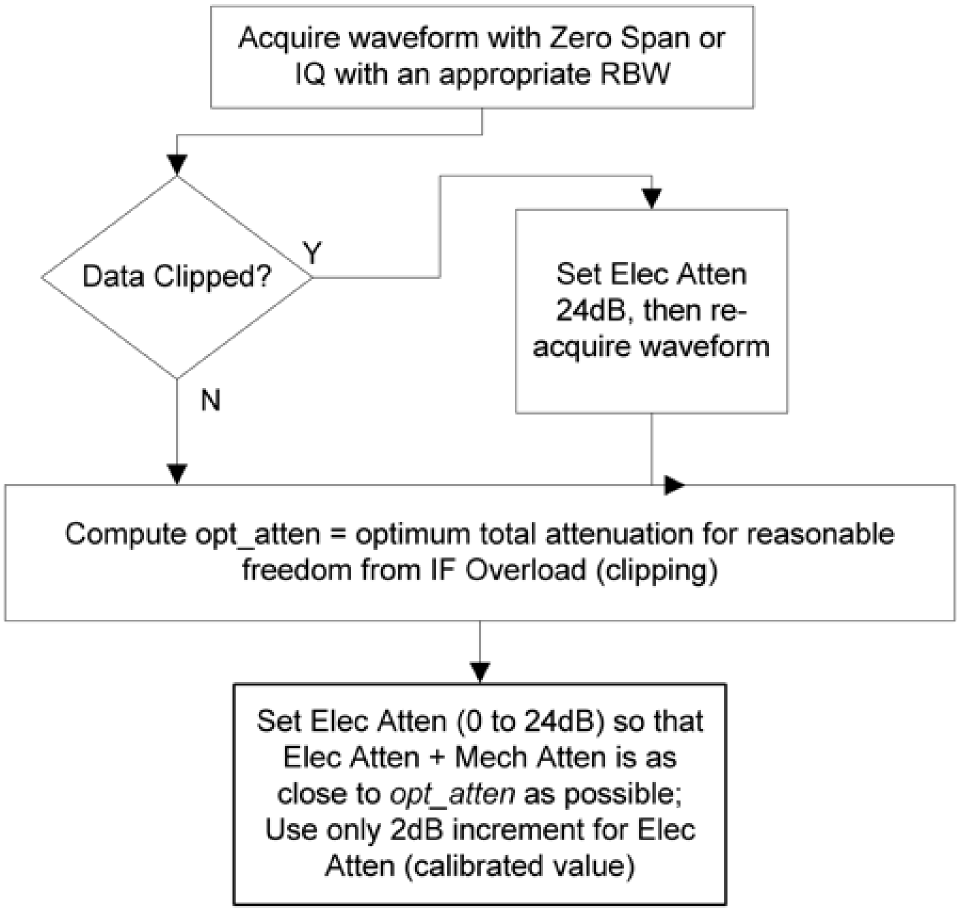
"Adjust Atten for Min Clipping" on page 1941 or "Pre-Adjust for Min Clipping" on page 736 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to opt_atten as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to opt_atten as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= opt_atten <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 736 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "Max Mixer Lvl Rules" on page 1948.

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real>` `[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?`
Example	`:POW:MIX:RANG -15 dBm` `:POW:MIX:RANG?`
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

`NORMal`	The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the Reference Level is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression with be negligible
`TOI`	Allows a range of settings of the "Max Mixer Level" on page 1947, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
`COMPression`	Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
`NORMal`	Normal – balance TOI, noise, and compression	–10	–50	0
`TOI`	TOI-limited dynamic range	–25	–50	–10
`COMPression`	Compression-limited dynamic range	–3	–10	+30

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal | TOI | COMPression` `[:SENSe]:POWer[:RF]:MIXer:RULEs?`
Example	`:POW:MIX:RULE:COMP`
Dependencies	Only appears in the Swept SA and RTSA measurements
Preset	`NORM`

3.4.3.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

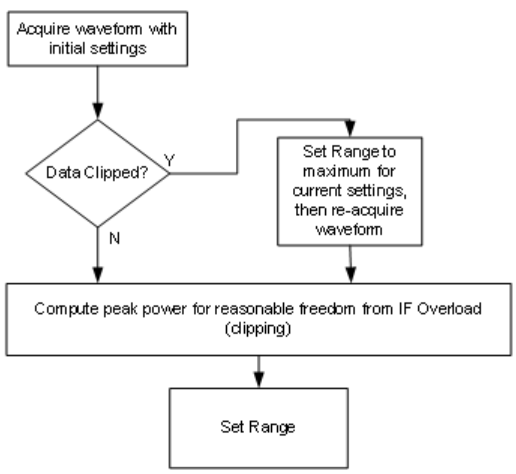
Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and ON) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1953 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	Does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1955. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.4.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9421A, or UXM.

This tab *does* appear in VXT Models M9410A/11A, because "Software Preselection" on page 1971 is under this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1958 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 747.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed

	The offset applied to do the centering appears in "Preselector Adjust" on page 1958
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated

3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 1956 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`

Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1956, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for Low Band, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, **N/A** is displayed in the square brackets for Low Band.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL`
	`[:SENSe]:POWer[:RF]:GAIN:BAND?`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW`

	OFF
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1959. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

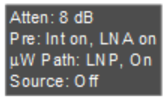
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 1959, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 750

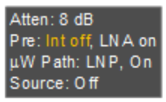
Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9421A/10A/11A May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the

input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 755
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 757
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 758

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL` `[:SENSe]:POWer[:RF]:MW:PATH?`

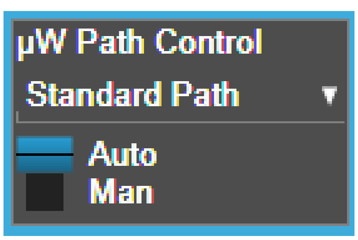
Example	`:POW:MW:PATH LNP`
	Enables the Low Noise path
	`:POW:MW:PATH?`

Notes	If "Presel Center" on page 1956 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A, nor in BBIQ and External Mixing – The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed – The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed – The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”

Preset	**Mode** / **Value** IQ Analyzer, Pulse, Avionics: MPB option present and licensed: `MPB` MPB option not present and licensed: `STD` All other Modes: `STD`
State Saved	Save in instrument state
Range	Standard Path | Low Noise Path Enable | µW Presel Bypass | Full Bypass Enable
Annotation	In the Meas Bar, if the Standard path is chosen: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch *is* thrown: µW Path: LNP,On If the preselector is bypassed: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch *is* thrown: µW Path: FByp,On

µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:



This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass

Measurement	When µW Path Control is in Auto
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when ‘Enabled Wideband IF for FFT’ is OFF or ‘Sweep Type Rule’ is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and

Measurement	When µW Path Control is in Auto
	"Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

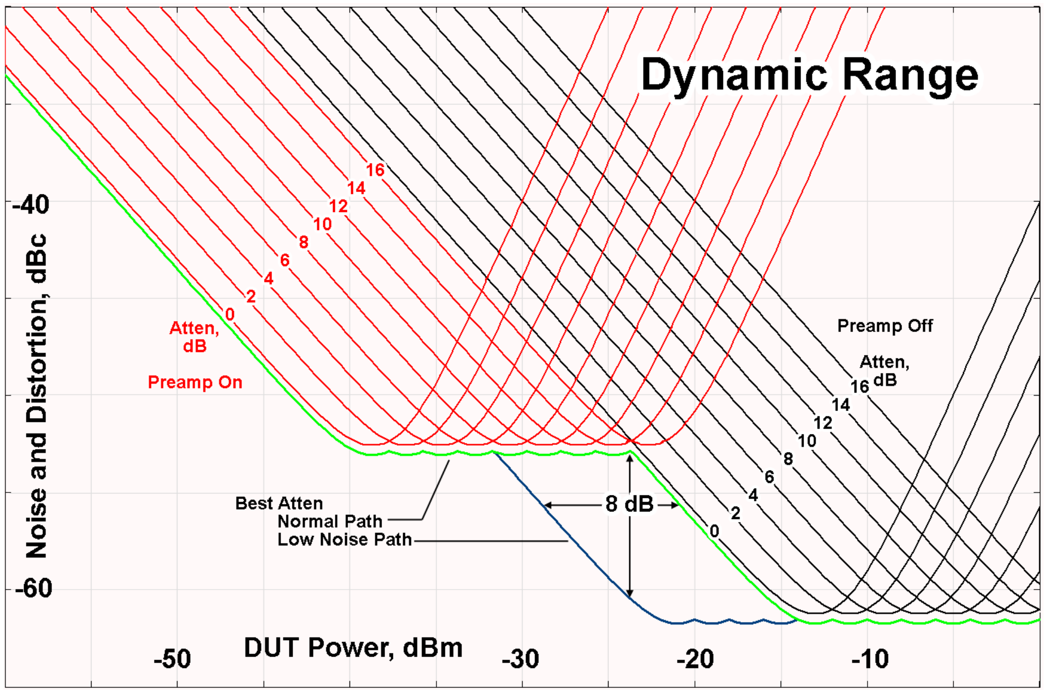
Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue

shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious

signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION When **Full Bypass Enable** is selected, and "Y Scale" on page 1929 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

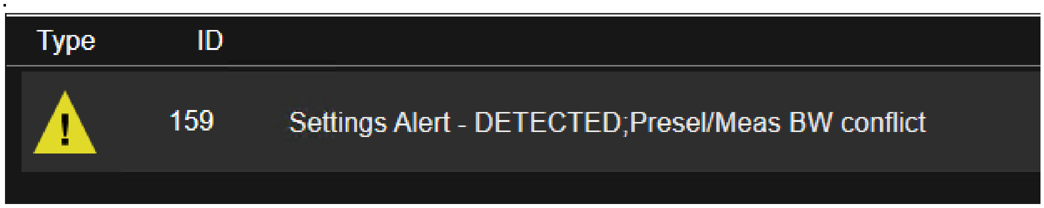
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection

Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

– There is some speed cost due to the need to take multiple captures

– Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

– `NORMal` - mathematically removes all image and multiple responses of signals present at the input

– `ADVanced` - any trace processing (such as "max hold" or trace averaging) is performed on the points of both candidate traces before the "select minimum" operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is `OFF`. The grayout message is "Unavailable unless SW Presel enabled"
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

– `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied

bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)

– NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is OFF. The grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when **Software Preselection** is enabled
Preset	N9041B: NORMal N9042B+V3050A: NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in SA Mode:

	`:SAN:PFIL ON`
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See "Prefilter Presets" on page 764 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.4.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for "Res BW" on page 765 and "Video BW" on page 766.

The **Resolution BW** functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.4.4.1 Settings

Contains the basic bandwidth functions. In this measurement, it is the only tab under **BW**.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of the **Res BW** to "Span" on page 783 using the ratio set by **Span:3 dB RBW** (some measurements do not have a **Span:3 dB RBW** control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When the **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing "Auto Couple" on page 1995 or by performing a **Preset**.

When **Res BW** is set to **Auto**, the bandwidth selected depends on "RBW Filter Type" on page 767.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on **Filter Type** or **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:OBWidth:BANDwidth[:RESolution] <bandwidth>`
	`[:SENSe]:OBWidth:BANDwidth[:RESolution]?`
	`[:SENSe]:OBWidth:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:BANDwidth[:RESolution]:AUTO?`

Example	`:OBW:BAND 5 MHz`
	`:OBW:BAND?`
	`:OBW:BAND:AUTO ON`
	`:OBW:BAND:AUTO?`

Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depend on the current bandwidth type
Couplings	Sweep time is coupled to RBW. As RBW changes, the sweep time (if set to **Auto**) is changed to maintain amplitude calibration "Video BW" on page 766 is coupled to RBW. As the resolution bandwidth changes, the video bandwidth (if set to **Auto**) changes to maintain the ratio of VBW/RBW (10:1) When **Res BW** is set to **Auto**, the resolution bandwidth is auto-coupled to the span. The ratio of

	Span/RBW is approximately 106:1 when auto coupled. When **Res BW** is set to **Man**, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	**Auto**, unless noted in "RBW Presets" on page 766 below See table below
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A "#" mark appears before "RBW" in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility, this command supports both `BANDwidth` and `BWIDth` forms For ESA, the maximum Res BW was 5 MHz; for X-Series it is 8 MHz

RBW Presets

Unless noted in the table below, the Preset value of RBW is **Auto**.

Mode	Preset Value
WCDMA	30 kHz
BT	10 kHz
WLAN	100 kHz
MSR	30 kHz
LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR	30 kHz

Video BW

Lets you change the instrument post-detection filter (VBW or "video bandwidth") from 1 Hz to 8 MHz, in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Video BW (Auto) selects automatic coupling of **Video BW** to "Res BW" on page 765. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on **Video BW**. This may also be done by pressing "Auto Couple" on page 1995 or by performing a **Preset**.

Remote Command	`[:SENSe]:OBWidth:BANDwidth:VIDeo <bandwidth>`
	`[:SENSe]:OBWidth:BANDwidth:VIDeo?`
	`[:SENSe]:OBWidth:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:BANDwidth:VIDeo:AUTO?`

Example	`:OBW:BAND:VID 2.4 MHz`
	`:OBW:BAND:VID?`
	`:OBW:BAND:VID:AUTO ON`
	`:OBW:BAND:VID:AUTO?`

Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed **Video BW** is not actually used to process the trace data: When the **Average** detector is selected, and **Sweep Type** is set to **Swept**, the video bandwidth filter cannot be used, because it uses the same hardware as the **Average** detector When the **Quasi-Peak**, **EMI Average**, or **RMS Average** detector is selected, **Video BW** is implemented by the digital IF as part of the detector In this case, **Video BW** still acts to change the Sweep Time, if Sweep Time is in **Auto**, and still affects the data on other traces for which this is not the case
Couplings	Normally coupled to **Res BW**. If **Video BW** is set to **Auto**, then video bandwidth is changed as **Res BW** changes, to maintain the preset ratio (normally 10:1)
Preset	**Auto**, unless noted in "Video BW Presets" on page 767 below `ON`
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A “#” mark appears before “VBW” in the annotation when it is not coupled
Annotation	In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility, this command supports both `BANDwidth` and `BWIDth` forms

Video BW Presets

Unless noted in the table below, the Preset value is **Auto**.

Mode ID	Preset Value
WCDMA	300 kHz
BT	30 kHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the **Res BW** filters in HP/Agilent/Keysight spectrum analyzers were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz **Res BW** filter was a Gaussian shape with its –3 dB points 10 MHz apart. In X-Series, you can choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI
Gaussian	GAUSsian
Flattop	FLATtop

Remote Command	[:SENSe]:OBWidth:BANDwidth:SHAPe GAUSsian | FLATtop [:SENSe]:OBWidth:BANDwidth:SHAPe?
Example	:OBW:BAND:SHAP GAUS :OBW:BAND:SHAP?
Preset	"Auto Couple" on page 1995 selects the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:

–3 dB (Normal) filter BW	Res BW 300 Hz
–6 dB filter BW	Res BW (–6 dB) 422 Hz
Noise filter BW	Res BW (Noise) 317 Hz
Impulse filter BW	Res BW (Impulse) 444 Hz
CISPR filter BW	Res BW (CISPR) 200 Hz
MIL filter BW	Res BW (MIL) 1 kHz
Flattop filter type	Res BW (Flattop) 300 Hz

Backwards Compatibility SCPI	[:SENSe]:OBWidth:BWIDth:SHAPe

3.4.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.4.5.1 Meas Display

Contains controls for setting the display for the current Measurement, View or Window.

x dB BW Boundaries On/Off

Turns the x dB BW Boundaries On or Off.

Remote Command	:DISPlay:OBWidth:WINDow[1]:XDB 0 | 1 | OFF | ON :DISPlay:OBWidth:WINDow[1]:XDB?
Example	:DISP:OBW:WIND:XDB 1 :DISP:OBW:WIND:XDB?
Preset	0
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:OBWidth:VIEW:WINDow[1]:XDB

Boundary Frequency

Selects frequency display type:

– OFFSet: offsets from Center Freq to OBW boundary frequency are displayed

– ABSolute: absolute frequencies are displayed

Remote Command	:DISPlay:OBWidth:WINDow2:BOUNdaries:FREQuency OFFSet | ABSolute :DISPlay:OBWidth:WINDow2:BOUNdaries:FREQuency?
Example	:DISP:OBW:WIND2:BOUN:FREQ ABS :DISP:OBW:WIND2:BOUN:FREQ?
Preset	OFFSet
State Saved	Saved in instrument state
Range	OFFSet|ABSolute
Backwards Compatibility SCPI	:DISPlay:OBWidth:VIEW2:WINDow2:BOUNdaries:FREQuency

3.4.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When OFF, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to OFF when **System Display Settings**, **Annotation** is OFF
Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ....

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	`:DISPlay:ANNotation:FREQuency[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:FREQuency[:STATe]?`
Example	`:DISP:ANN:FREQ OFF`
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	`ON`

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When OFF, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1 :DISPlay:ANNotation:MBAR[:STATe]?
Example	:DISP:ANN:MBAR OFF
Dependencies	Grayed out and forced to OFF when **System Display Settings**, **Annotation** is OFF
Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

– and you are in local operation, the display can be turned back on by pressing any key or by sending :SYSTem:DEFaults MISC or :DISPlay:ENABle ON (neither *RST nor :SYSTem:PRESet enable the display)

– and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending :SYSTem:DEFaults MISC or :DISPlay:ENABle ON (neither *RST nor :SYSTem:PRESet enable the display)

– and you are using either the :SYSTem:KLOCk command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is OFF, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SELect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SELect
Delete Screen	:INSTrument:SCReen:DELete
Delete All But This Screen	:INSTrument:SCReen:DELete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.4.5.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 711

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>`

Command	`:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME “Baseband”`

	Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`

Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views

If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1983), then query the list of available Views, the result is undefined

3.4.6 Frequency

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.4.6.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule (when frequency Scale Type is set to linear). While adjusting **Center Frequency**, **Span** is held constant, which means that both **Start Freq** and **Stop Freq** will change.

In measurements that also have **Start Freq** and **Stop Freq** controls, pressing **Center Frequency** sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the **Frequency** menu is **Center Frequency**. In the Start/Stop annotation mode, **Start Freq** and **Stop Freq** are displayed below the graticule instead of **Center Frequency** and **Span**.

Pressing **Center Frequency** also sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the **Frequency** menu is **Center Frequency**.

When **Display Scale Type** is set to `LOG`, pressing **Center Frequency** sets the frequency that corresponds to the arithmetic mean of the start frequency and stop frequency, which is not at the horizontal center of the graticule.

The center frequency setting is the same for all measurements within a Mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, the Mode has a **Global** tab in its **Meas Setup** menu.

Center Frequency sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input (see "RF Center Frequency" on page 781 and "Ext Mix Center Freq" on page 782).

Center Frequency is remembered as you go from input to input. Thus you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you return to the RF Input, **Center Frequency** reverts to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	Set Center Frequency to 50 MHz:
	`:FREQ:CENT 50 MHz`
	Increment **Center Frequency** by the value of **CF Step**:
	`:FREQ:CENT UP`
	Return the current value of **Center Frequency**:
	`:FREQ:CENT?`

Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: – For RF input it is equivalent to `:FREQ:RF:CENT` – For I/Q input it is equivalent to `:FREQ:IQ:CENT` – For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values depend on Hardware Options

	If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than frequency is used, an invalid suffix error message is generated
Dependencies	**Center Frequency** can be limited by **Start Freq** or **Stop Freq** limits, if **Span** is so large that start or stop reach their limits
Couplings	When operating in "swept span", any value of **Center Frequency** or **Span** that is within the frequency range of the instrument is allowed, *if* the value is being set through the front panel numeric key pad or the SCPI command. The other parameter is forced to a different value if needed, to keep Start and Stop Frequencies within the instrument's frequency range Coupling between center frequency and span: numeric (keypad) entries are treated differently than changing the value using the step keys (**Up/Down Arrows**) or the knob. Similarly, for remote operation, sending a numeric frequency value is treated differently than the UP|DOWN keywords: – Numeric entries (keypad or remote): Any value of **Center Frequency** or **Span** (within the frequency range of the instrument) is allowed. The other parameter is changed, as necessary, to keep the Start Freq and Stop Freq within the instrument frequency range – Knob or Step keys (up/down arrows) or UP|DOWN keywords: The value of the parameter being changed (**Center Frequency** or **Span**) is limited so the other parameter is not forced to a new value. Thus, if only the step keys and knob are used, you can return to the initial **Center Frequency** and **Span** by changing only the current parameter Note that, since out-of-range **Start Freq** and **Stop Freq** are never allowed, markers and trace math work correctly without requiring any special handling for out-of-range conditions
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 779 and "Ext Mix Center Freq" on page 782
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 779 and "Ext Mix Center Freq" on page 782
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

RF Center Frequency

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that **Center Frequency** in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set **Center Frequency** such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning If Source Mode is set to Tracking, and the Max or Min **Center Frequency** is therefore limited by the limits of the source, a warning message is generated, "Data out of range; clipped to source max/min" if these limits are exceeded. Note that for an external source, these limits can be affected by the

	settings of Source Numerator, Source Denominator, and Power Sweep
Preset	See "Center Frequency Presets" on page 779
State Saved	Saved in instrument state
Min	**Instrument Types** / **Value**: VXT model M9421A: 55.000005 MHz VXT models M9410A/11A: 6.505 kHz with Option LFE; 330.000005 MHz without Option LFE; 330.000005 MHz VXT model M9415A: 330.000005 MHz M8920A: 80.005 kHz All other instruments: –79.999995 MHz *Unless* Source Mode is set to Tracking, in which case it is limited by the minimum frequency of the Source
Max	See table above. Basically, instrument maximum frequency – 5 Hz. Note that, if the Source Mode is set to Tracking, the effective instrument maximum frequency may be limited by the source maximum frequency If the knob or step keys are being used, also depends on the value of the other three interdependent parameters: **Span**, **Start Frequency** and **Stop Frequency**

Min table:

Instrument Types	Value
VXT model M9421A	55.000005 MHz
VXT models M9410A/11A	6.505 kHz with Option LFE 330.000005 MHz without Option LFE 330.000005 MHz
VXT model M9415A	330.000005 MHz
M8920A	80.005 kHz
All other instruments *Unless* Source Mode is set to Tracking, in which case it is limited by the minimum frequency of the Source	–79.999995 MHz

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Frequency** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When you return to External Mixing after using one of the other inputs (for example, RF), you return to the settings that you had when you left External Mixing. So, you return to the band you were in with the **Center Frequency** that you had. However, **Span** is *not* an input-dependent parameter, so it does not change. Therefore, the instrument comes back with the **Span** from the previous input, limited as necessary by the current mixer setup

Preset	When **Mode Preset** is performed while in External Mixing, the start frequency of the current Mode is set to the nominal Min frequency of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the stop frequency of the current Mode is set to the nominal Max frequency of the highest harmonic range in the Harmonic Table. **Center Frequency** thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited **Span** available to it, and cannot achieve the span shown in the table (**Span** = **Stop Freq** – **Start Freq**), the instrument uses the maximum span that the measurement allows, and still sets **Center Frequency** to the midpoint of the **Start Freq** and **Stop Freq** values in the Harmonic Table When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after **Restore Input/Output Defaults**, if you switch to External Mixing and do a **Mode Preset** while in the Spectrum Analyzer Mode, the resulting **Center Frequency** is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on the value of the other three interdependent parameters **Span**, **Start Freq** and **Stop Freq**

Span

Set the frequency of the occupied bandwidth span for the current measurement.

Remote Command	`[:SENSe]:OBWidth:FREQuency:SPAN <freq>`
	`[:SENSe]:OBWidth:FREQuency:SPAN?`
	`[:SENSe]:OBWidth:FREQuency:SPAN:AUTO ON | OFF | 0 | 1`
	`[:SENSe]:OBWidth:FREQuency:SPAN:AUTO?`

Example	`:OBW:FREQ:SPAN 2.4 MHz`
	`:OBW:FREQ:SPAN?`
	`:OBW:FREQ:SPAN:AUTO 0`
	`:OBW:FREQ:SPAN:AUTO?`

Notes	Span Auto Detector (`[:SENSe]:OBWidth:FREQuency:SPAN:AUTO`) is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes
Dependencies	The Auto Detect functionality is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes
Preset	see table below

Mode	Value
SA	3 MHz
WCDMA	10 MHz
LTEAFDD, LTEATDD	10 MHz

Mode	Value
BT	2 MHz
5GNR	Automatically calculated
RTS	27 kHz
MSR	10 MHz
WLAN	Radio Std: 802.11b = 30MHz; 802.11a/g/n/ac/ax/be (20MHz) = 25 MHz; 802.11n/ac/ax/be (40MHz) = 50 MHz; 802.11n/ac/ax/be (80MHz) = 100 MHz; 802.11ac/ax/be (160MHz) = 200 MHz; 802.11be (320MHz) = 400 MHz

WLAN:

Radio Std	Value
802.11b	30MHz
802.11a/g/n/ac/ax/be (20MHz)	25 MHz
802.11n/ac/ax/be (40MHz)	50 MHz
802.11n/ac/ax/be (80MHz)	100 MHz
802.11ac/ax/be (160MHz)	200 MHz
802.11be (320MHz)	400 MHz

State Saved	Yes
Min	100 Hz
Max	Hardware Maximum Span
Backwards Compatibility SCPI	[:SENSe]:EBWidth:FREQuency:SPAN

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected, and the center frequency function is active, the step keys (and the UP|DOWN parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that Start Frequency and Stop Frequency also step by the **CF Step** value.

Remote Command	[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq> [:SENSe]:FREQuency:CENTer:STEP[:INCRement]? [:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1 [:SENSe]:FREQuency:CENTer:STEP:AUTO?
Example	Increase the current center frequency value by 500 MHz: :FREQ:CENT:STEP 500 MHz :FREQ:CENT UP

	`:FREQ:CENT:STEP:AUTO ON` `:FREQ:CENT:STEP:AUTO?`
Notes	Preset and Max values depend on Hardware Options
Dependencies	Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the **Up Arrow** key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Couplings	When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value
Preset	Auto `ON`
State Saved	Saved in instrument state
Min	– /+(the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Freq Offset

Lets you set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument, including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a **Mode Preset**, or set the frequency offset to 0 Hz.

See "More Information" on page 786.

Remote Command	`[:SENSe]:FREQuency:OFFSet <freq>` `[:SENSe]:FREQuency:OFFSet?`
Example	`:FREQ:OFFS 10 MHz` `:FREQ:OFFS?`
Notes	Preset and Max values depend on Hardware Options
Dependencies	Appears only in Spectrum Analyzer Mode Not available in External Mixing. In this case, the control is grayed-out and shows a value of zero. However, the value of CF Offset that was set for the RF Input is retained and is restored when you switch back to the RF Input
Preset	See table under "Center Frequency" on page 777
State Saved	Saved in instrument state

Min	-500 GHz
Max	500 GHz
Annotation	If Frequency Offset is not zero, "Freq Offset <value>" appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped
Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:X[:SCALe]:OFFSet` The `DISPlay` version of the command is in the instrument for compatibility across platforms and is not recommended for new development
Backwards Compatibility Notes	In pre-X-Series instruments, **Freq Offset** could not be adjusted by the knob or step keys. That is no longer the case Some previous spectrum analyzers did not adjust frequency counter results for **Freq Offset**. The X-Series does adjust the frequency counter for the offset

More Information

This command does not affect any bandwidths or the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by **Freq Offset**. Changing the offset, even on a trace that is not updating will immediately change all the above, without taking new data.

NOTE If a trace is exported with a nonzero **Freq Offset**, the exported data will contain the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want **Freq Offset** to be 0, or the offset would be applied again to data that is already offset. No such care need be taken when saving a State+Trace file because the data and state are saved together.

Full Span (Remote Command Only)

Changes the Occupied Bandwidth Span to show the full frequency range of the instrument. It maximizes the span within a range but does not change **Center Frequency**. When using external mixing, it changes the displayed frequency span to the frequency range specified for the selected external mixing band.

Remote Command	`[:SENSe]:OBWidth:FREQuency:SPAN:FULL`
Example	`:OBW:FREQ:SPAN:FULL`
Couplings	Selecting full span changes the measurement span value

3.4.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to **Normal** mode (see "Marker Mode" on page 789), and places it at the center of the display. If the selected marker is **Off**, it is set to **Normal** and placed at the center of the screen, on the trace determined by the Marker Trace rules.

3.4.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a **Peak Search**, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

For any menu that includes **Select Marker**, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the **Marker** menu and is used if a search is done, or a Band Function is turned on, or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal** and **Delta** markers

3.4.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection for the marker control mode (**Normal**/`POSition`, **Delta** or **Off**; see "Marker Mode" on page 789) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. It has no effect if the control mode (see "Marker Mode" on page 789) is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:X <freq>` `:CALCulate:OBWidth:MARKer[1]|2|…|12:X?`

Example	`:CALC:OBW:MARK3:X 0` `:CALC:OBW:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is **Normal**, or the offset from the marker’s reference marker if the control mode is **Delta**. The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and **Inverse Time**, seconds for **Period** and **Time**
Preset	After a preset, all markers are turned `OFF`, so Marker X Axis Value query returns Not a Number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:X:POSition <real>` `:CALCulate:OBWidth:MARKer[1]|2|…|12:X:POSition?`
Example	`:CALC:OBW:MARK10:X:POS 0` `:CALC:OBW:MARK10:X:POS?`
Notes	The query returns the marker’s absolute X-Axis value in trace points if the control mode is **Normal**, or the offset from the marker’s reference marker in trace points if the control mode is **Delta**. The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition If the marker is **Off**, the query response is Not A Number
Preset	After a preset, all markers are turned **Off**, so the query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y-Axis value in the current marker Y-Axis unit.

Remote	`:CALCulate:OBWidth:MARKer[1]|2|…|12:Y?`

Command	
Example	`:CALC:OBW:MARK11:Y?`
Notes	Returns the marker Y-Axis result, if the control mode is **Normal** or **Delta** If the marker is **Off**, the response is Not A Number
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:OBWidth:MARKer[1]|2|…|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to **Normal** (`POSition`), **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is `OFF`, pressing **Marker** sets it to **Normal** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **Off**, there is no active function, and the active function is turned off.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:MODE POSition | DELTa | OFF` `:CALCulate:OBWidth:MARKer[1]|2|…|12:MODE?`
Example	`:CALC:OBW:MARK:MODE POS` `:CALC:OBW:MARK:MODE?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backwards Compatibility SCPI Command

Sets or queries the state of a marker. Setting a marker that is `OFF` to `ON` (1), puts it in **Normal** mode, and places it at the center of the screen.

Example	`:CALC:OBW:MARK3:STAT ON`

	`:CALC:OBW:MARK3:STAT?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:CALCulate:OBWidth:MARKer[1]|2|…|12:STATe OFF | ON | 0 | 1` `:CALCulate:OBWidth:MARKer[1]|2|…|12:STATe?`

Delta Marker (Reset Delta)

Pressing this button has the same effect as pressing **Delta** in **Marker Mode**. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:OBWidth:MARKer:AOFF`
Example	`:CALC:OBW:MARK:AOFF`

3.4.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with "Marker Delta" on page 791.

NOTE: Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 787 on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE	Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:MAXimum`

Example	`:CALC:OBW:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. The message "No peak found" (-200) will be returned after an unsuccessful search

Notes	Sending this command selects the subopcoded marker In WCDMA Mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button has the same effect as pressing **Delta** in "Marker Mode" on page 789 on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

3.4.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 787 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:REFerence <integer>` `:CALCulate:OBWidth:MARKer[1]|2|…|12:REFerence?`
Example	`:CALC:OBW:MARK:REF 2` `:CALC:OBW:MARK:REF?`
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded, the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" The query returns a single value (the specified marker number's relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a **Delta** marker If the reference marker is **Off**, it is turned on in **Normal** mode at the **Delta** marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults**. This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by **Marker Off** and hence not affected by **Preset** or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-

Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become **Normal** or **Delta** markers (see "Marker Mode" on page 789).

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not **Off**, it moves from the trace it was on to the new trace. If the marker is **Off**, it stays off, but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|…|12:TRACe 1 | 2 | 3` `:CALCulate:OBWidth:MARKer[1]|2|…|12:TRACe?`
Example	`:CALC:OBW:MARK2:TRAC 2` `:CALC:OBW:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by "Auto Couple" on page 1995 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "Marker Settings Diagram" on page 790 on the **Settings** tab.

3.4.8 Meas Setup

Contains functions for setting up the measurement parameters and contains functions for setting up parameters global to all measurements in the mode.

3.4.8.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

Avg/Hold Num

Specifies the number of measurement averages used when calculating the measurement result. The average is displayed at the end of each sweep.

Initiates an averaging routine that averages the sweep points in several successive sweeps, resulting in trace smoothing.

After the specified number of average counts, "Average Mode" on page 794 (termination control) determines the average action.

Remote Command	`[:SENSe]:OBWidth:AVERage:COUNt <integer>` `[:SENSe]:OBWidth:AVERage:COUNt?`
Example	`:OBW:AVER:COUN 1500` `:OBW:AVER:COUN?`
Preset	10
State Saved	Yes
Min/Max	1/10000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N where n is the current average and N is the average count
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:AVERage:COUNt`

Averaging On/Off

Turns averaging on or off.

NOTE In this measurement, **Average Type** is always preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:OBWidth:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:OBWidth:AVERage[:STATe]?`
Example	`:OBW:AVER ON` `:OBW:AVER?`
Couplings	**Averaging** state is coupled to "Max Hold (Remote Command Only)" on page 800. If **Max Hold** is changed from `OFF` to `ON`, **Averaging** state is automatically set to `ON`
Preset	`ON`
State Saved	Yes
Range	`ON|OFF`
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:AVERage[:STATe]`

Average Mode

Lets you set the averaging mode.

EXPonential	Measurement averaging continues using the specified number of averages to compute each averaged value. The average is displayed at the end of each sweep
REPeat	The measurement resets the average counter each time the specified number of averages is reached

Remote Command	`[:SENSe]:OBWidth:AVERage:TCONtrol EXPonential | REPeat` `[:SENSe]:OBWidth:AVERage:TCONtrol?`
Example	`:OBW:AVER:TCON REP` `:OBW:AVER:TCON?`
Preset	`EXP`
State Saved	Yes
Range	`EXPonential|REPeat`

% of OBW Power

Assigns the percentage of the total power that is measured within the Occupied Bandwidth for the current measurement. The resulting Occupied Bandwidth limits are displayed by markers placed on the frequencies of the specified percentage.

Remote Command	`[:SENSe]:OBWidth:PERCent <real>` `[:SENSe]:OBWidth:PERCent?`
Example	`:OBW:PERC 75` `:OBW:PERC?`
Preset	99.00
State Saved	Yes
Min/Max	10/99.99

Power Ref

Lets you select Power Ref type:

Total Power	TPOWer	Total power in the current span is displayed
OBW Power	OBWPower	Occupied power is displayed

When **Power Ref** type is changed, the annotation in the lower window and Remote Command SCPI Results also change.

Remote Command	`[:SENSe]:OBWidth:PREFerence | OBWPower` `[:SENSe]:OBWidth:PREFerence?`
Example	`:OBW:PREF TPOW`

	`:OBW:PREF?`
Preset	`TPOWer`
State Saved	Saved in instrument state
Range	`TPOWer|OBWPower`

x dB

Sets the x dB value used for the "x dB bandwidth" result that measures the bandwidth between two points on the signal that is x dB down from the highest signal point within the OBW Span.

Remote Command	`[:SENSe]:OBWidth:XDB <rel_ampl>` `[:SENSe]:OBWidth:XDB?`
Example	`:OBW:XDB -20` `:OBW:XDB?`
Preset	BT Mode: -20.0 dB All other Modes: -26.0 dB
State Saved	Yes
Min/Max	-100.0 dB/-0.1 dB
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:XDB`

Power Integration Method

Selects the power integration method:

Normal	`NORMal`	By integrating the linear power bucket values from the lower edge of the trace, and interpolating to find the point where the integrated power equals (1 – [Occ BW % Pwr]) / 2 (0.5% if, for example, the 99% occupied bandwidth is to be found) of the total power, frequency f1 is obtained. This procedure is repeated from the upper trace edge to find frequency f2. This calculation uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points), f1 and f2
From Center	`ICENter`	Measures the power spectrum distribution within two times or more frequency range over the requirement for Occupied Bandwidth specification centering on the current carrier frequency

Remote Command	`[:SENSe]:OBWidth:INTegration[:METHod] NORMal	ICENter` `[:SENSe]:OBWidth:INTegration[:METHod]?`
Example	`:OBW:INT NORM`

	:OBW:INT?	
Preset	For 5GNR Mode, Uplink:	ICENter
	All other Modes	NORMal
State Saved	Yes	
Range	NORMal|ICENter	

Spur Avoidance

Because VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to "Disabled."

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be impacted by the fact that **Spur Avoidance** is not in effect.

The spur avoidance function is not available for:

- M9410A/11A with EP6 option at frequency above 6 GHz
- M9415A/16A at frequency below 380 MHz and above 12.3 GHz
- M9410E/11E/15E/16E at frequency below 380 MHz and above 25.9 GHz

Remote Command	[:SENSe]:OBWidth:SAVoid[:STATe] OFF | ON | 0 | 1 [:SENSe]:OBWidth:SAVoid[:STATe]?
Example	:OBW:SAV ON :OBW:SAV?
Dependencies	Only appears in VXT models M9410A/11A/15A/16A and M9410E/11E/15E/16E
Preset	OFF

State Saved	Saved in instrument state
Range	OFF|ON

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 799 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter’s coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple***does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	:CONFigure:OBWidth
Example	:CONF:OBW

Max Hold (Remote Command Only)

When ON, **Max Hold** displays and holds the maximum responses of the current measurement. Turn **Max Hold**OFF to disable the maximum hold feature.

Remote Command	[:SENSe]:OBWidth:MAXHold ON | OFF | 1 | 0 [:SENSe]:OBWidth:MAXHold?
Example	:OBW:MAXH ON :OBW:MAXH?
Couplings	**Max Hold** is coupled to "Averaging On/Off" on page 794. **Max Hold** is activated only if **Average** state is ON. If **Max Hold** is changed to ON when **Average** state is OFF, **Average** state is automatically set to ON
Preset	OFF
State Saved	Yes
Range	OFF|ON
Backwards Compatibility SCPI	[:SENSe]:EBWidth:MAXHold

3.4.8.2 Limits

Lets you set measurement limits and be alerted when they have been exceeded.

Limit

Enables you to turn on or off limit checking at the specified frequency. For results that fail the limit test, a red FAIL appears in the Meas Bar.

Remote Command	:CALCulate:OBWidth:LIMit:FBLimit <freq> :CALCulate:OBWidth:LIMit:FBLimit? :CALCulate:OBWidth:LIMit[:TEST] ON | OFF | 1 | 0 :CALCulate:OBWidth:LIMit[:TEST]?
Example	:CALC:OBW:LIM:FBL 50 kHz

<table>
<tr><td></td><td>:CALC:OBW:LIM:FBL?

3.4.8.3 Meas Standard

Contains controls that allow you to preset the PowerSuite measurements to conform to various communications standards.

Radio Standard Presets

Lets you specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which is a cascading list of standards. When you have the selected the desired Standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command	`[:SENSe]:RADio:STANdard[:SELect] NONE | JSTD | IS95a | IS97D | IS98D | GSM | W3GPP | C2000MC1 | C20001X | NADC | PDC | BLUEtooth | TETRa | WL802DOT11A | WL802DOT11B | WL802DOT11G | HIPERLAN2 | DVBTLSN | DVBTGPN | DVBTIPN | FCC15 | SDMBSE | UWBINDOOR | LTEB1M4 | LTEB3M | LTEB5M | LTEB10M | LTEB15M | LTEB20M | WL11N20M | WL11N40M | WL11AC20M | WL11AC40M | WL11AC80M | WL11AC160M | WL11AX20M | WL11AX40M | WL11AX80M | WL11AX160M | WL11BE20M | WL11BE40M | WL11BE80M | WL11BE160M | WL11BE320M | WL11AD2G | WL11AY2G16 | WL11AY4G32 | WL11AY6G48 | WL11AY8G64 | NR5GFR1B100M` `[:SENSe]:RADio:STANdard[:SELect]?`
Example	`:RAD:STAN NONE` `:RAD:STAN?`
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state

The **Radio** column in the table lets you specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station (BTS) settings, for all relevant PowerSuite measurements. The Device SCPI command has the same effect as a selection in the **Radio** column:

Remote Command	`[:SENSe]:RADio:STANdard:DEVice BTS | MS` `[:SENSe]:RADio:STANdard:DEVice?`
Example	`:RAD:STAN:DEV MS` `:RAD:STAN:DEV?`
Preset	`BTS`
State Saved	Saved in instrument state
Range	`BTS|MS`

Chart for Standard and Available Measurements

Note that not every measurement in Spectrum Analyzer Mode is available for every standard. The chart below describes which measurements are available for each Radio Standard.

For TOI or Harmonics measurements, *no* Radio Standards are available.

	Swept SA	CHP	OBW	ACP	CCDF	Burst Power	Spurious Emission	SEM	List Sweep
None	X	X	X	X	X	X	X	X	(X)
3GPP 5G NR	(X)	X	X	X	X			X	(X)

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules
TETRA	Command Example	:RAD:STAN TETR
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
	RRC Filter	On
	RRC Filter Alpha	0.35
FCC Part15 Subpart F	Command Example	:RAD:STAN FCC15

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

DVB-T L/SECAM/NICAM	Command Example	:RAD:STAN DVBTLSN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001

DVB-T G/PAL/NICAM	Command Example	:RAD:STAN DVBTGPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T I/PAL/NICAM	Command Example	:RAD:STAN DVBTIPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
S-DMB System E	Command Example	:RAD:STAN SDMBSE
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	:RAD:STAN GSM
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP W-CDMA	Command Example	:RAD:STAN W3GPP
	IBW	5 MHz
	Span	7.5 MHz
	RBW	240 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

3GPP LTE 1.4 MHz	Command Example	:RAD:STAN LTEB1M4
	IBW	1.4 MHz
	Span	2.1 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 3 MHz	Command Example	:RAD:STAN LTEB3M
	IBW	3 MHz
	Span	4.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 5 MHz	Command Example	:RAD:STAN LTEB5M
	IBW	5 MHz
	Span	7.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 10 MHz	Command Example	:RAD:STAN LTEB10M
	IBW	10 MHz
	Span	15 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 15 MHz	Command Example	:RAD:STAN LTEB15M
	IBW	15 MHz
	Span	22.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 20 MHz	Command Example	:RAD:STAN LTEB20M
	IBW	20 MHz
	Span	30 MHz
	RBW	Auto rules
	VBW	Auto rules
cdma2000	Command Example	:RAD:STAN C20001X :RAD:STAN C2000MC1 :RAD:STAN? (Query always returns C20001X)
	IBW	1.23 MHz
	Span	1.845 MHz

	RBW	24 kHz
	VBW	Auto rules
IS-95A	Command Example	:RAD:STAN IS95
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
J-STD-008	Command Example	:RAD:STAN JSTD
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
NADC	Command Example	:RAD:STAN NADC
	IBW	32.8 kHz
	Span	49.2 kHz
	RBW	1.2 kHz
	VBW	Auto rules
PDC	Command Example	:RAD:STAN PDC
	IBW	21 kHz
	Span	31.5 kHz
	RBW	6.2 kHz
	VBW	Auto rules
IS-97D/98D	Command Example	:RAD:STAN IS97D :RAD:STAN IS98D :RAD:STAN IS95C :RAD:STAN? Query always returns `IS97D`
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24kHz
	VBW	Auto rules

Band Class (IS-97D/98D only)

The following function is only available when you have selected the standard: IS-97D/98D. It lets you select the band class.

Remote Command	`[:SENSe]:RADio:STANdard:BAND:CLASs BC0 | BC1` `[:SENSe]:RADio:STANdard:BAND:CLASs?`

Example	`:RAD:STAN:BAND:CLAS BC0` `:RAD:STAN:BAND:CLAS?`
Preset	`BC0`
State Saved	Saved in instrument state
Range	0 (800 MHz Band)|1 (1900 MHz Band)

Wireless Radio Standards

The table below lists the CHP settings and provides an example for each wireless Radio Standard.

WLAN 802.11a	Command Example	:RAD:STAN WL802DOT11A
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11g	Command Example	:RAD:STAN WL802DOT11G
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11b	Command Example	:RAD:STAN WL802DOT11B
	IBW	25 MHz
	Span	37.5 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11n 20 MHz	Command Example	:RAD:STAN WL11N20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is NONE, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = [Offset Freq A] - 0.5*([Chan Integ BW] + [Ref BW])
2. Divide by 4.5. Call the result GuardbandGoalRBW

3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute AutoRBWGoal = min(IntegBWGoal, max(GuardbandGoalRBW, ChannelWidthGoalRBW))
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as `:CONF` allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to `NONE`.

Enable Non-Std Meas

Lets you specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to `NO`, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to `YES`, all measurements and standard selections are enabled, so you can select any combination.

NOTE: If you select an unavailable measurement or unavailable radio standard using the **Enable Non-Std Meas** control, the measurement results may not conform to the selected standard.

Remote Command	`[:SENSe]:RADio:STANdard:EAMeas YES | NO` `[:SENSe]:RADio:STANdard:EAMeas?`
Example	`:RAD:STAN:EAM YES` `:RAD:STAN:EAM?`
Preset	`NO`
State Saved	Saved in instrument state
Range	`YES|NO`

3.4.8.4 Advanced

Contains controls for setting advanced functions of the instrument. This tab does not appear in EXM, nor in VXT models M9420A/10A/11A.

Noise Floor Extension

Lets you configure **Noise Floor Extension** (NFE). All Modes that support NFE let you set it on or off. Additionally, some Modes support *two* “on” states for NFE, **Full** and **Adaptive**, as described below.

Adaptive Option Support

At present (Release: X-Apps 2024), support for **Adaptive** NFE is as follows:

Mode	Measurements	Supports Adaptive NFE?
BT	ACP, IBEM, IBSP	No
CQM	MON	Yes
EDGEGSM	EORF, ETSP, MON	No
EMI	APD, DAN, FSC, MON, RTSC, SCH	Yes
LTEAFDD	PVT	No
LTEATDD	PVT	No
MSR	ACP, CHP, MON, OBW, SEM, SPUR	Yes
NR5G	PVT	No
PNOISE	LPL, MON, SFR	No
SA	SAN	Yes
SRCOMMS	ACP, CHP, MON, OBW, SEM, SPUR	Yes
VMA	ACP, CHP, OBW, SEM, SPUR	Yes
WCDMA	ACP, CHP, MON, OBW, SEM, SPUR	Yes
WLAN	CHP, MON, OBW, SEM, SPUR	Yes

The menus and command options are as follows:

NFE State	Modes with Adaptive NFE	Modes without Adaptive NFE	SCPI
Off	**Off**	**Off**	See "NFE On/Off Command" on page 819
On	**Full**	**On**	
Adaptive	**Adaptive**	n/a	See "Adaptive NFE Command" on page 819

As shown in the table above, the **On** state (in Modes that do not support **Adaptive** NFE) matches the **Full** state in Modes that *do* support **Adaptive** NFE.

To maintain SCPI backwards compatibility, the existing command to turn NFE on or off is retained, and a new command is added to set the state to turn **Adaptive**`ON` or `OFF`:

- `[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, with the default changed to `ON` for Modes that support **Adaptive** NFE
- `[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default = `ON`

When NFE is **On** or **Full**, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

NFE works with any RBW, VBW, detector, any setting of **Average Type**, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to **Average** or **Peak**). It works best with extreme amounts of smoothing, and with the average detector, with the **Average Type** set to **Power**.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension** on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the **Average** detector, results are better with long sweep times and fewer trace averages. When using the **Sample** detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE **Noise Floor Extension has no effect unless the RF Input is selected, so when External Mixing is selected, it does nothing.**

For more details, see "Optimal Detector & Averaging Selections" on page 820 and "Recalibration of Noise Floor" on page 821.

Pros & Cons of Adaptive NFE

Adaptive NFE provides an alternative to fully-on or fully-off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the fully-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

In **Adaptive** NFE, there is not the same dramatic visual impact on the noise floor as there is in **Full** NFE. **Adaptive** NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. **Adaptive** NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the fully-off case; and when lots of averaging is being performed, the signal displays more like the **Full** NFE case.

Adaptive NFE is recommended for general-purpose use. For fully-ATE (automatic test equipment) applications, where possible distraction of the instrument user is not a risk, **Full** NFE is recommended.

NFE On/Off Command

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear. In those cases, the SCPI command is accepted without error, but has no effect
Couplings	When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the **Characterize Noise Floor** operation if it is needed When NFE is enabled through SCPI, and a **Characterize Noise Floor** operation is needed, an error is entered in the system error queue
Preset	Unaffected by **Mode Preset**. Turned `ON` at startup and by **Restore Mode Defaults** in Modes that support **Adaptive**. Turned `OFF` at startup and by **Restore Mode Defaults** in Modes that do *not* support **Adaptive** In Modes that support **Adaptive** NFE, the default (preset) state of NFE is **Adaptive**. In Modes that do not support **Adaptive** NFE, the default state of NFE is **Off**
State Saved	No

Adaptive NFE Command

Only effective in instruments with the NFE or NF2 license installed, and in Modes that support **Adaptive** NFE. For coverage, see "Adaptive Option Support" on page 817 above.

For all other cases, the SCPI command below is accepted without error, but has no effect.

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAptive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAptive?`

Example	First turn NFE on, this is **Full** mode
	`:CORR:NOIS:FLO ON`
	Then set it to **Adaptive**
	`:CORR:NOIS:FLO:ADAP ON`

Couplings	To maintain backwards compatibility, sending :`CORR:NOIS:FLO ON` turns NFE **Adaptive**`OFF`. To turn **Adaptive** on, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by **Mode Preset**, but set to `ON` at startup and by **Restore Mode Defaults**
State Saved	No

Optimal Detector & Averaging Selections

Note that some measurements do not allow you to switch the **Detector** type (which is set by default to **Average**), so the discussion of detector types here is irrelevant for those measurements. Similarly, some measurements do not allow you to set **Average Type** (set by default to `LOG`), so that discussion here is irrelevant in those cases.

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to obtain the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when **Detector** is **Average** and **Average Type** is set to **Power** (`RMS`).

For best operation, **AverageDetector** (default) and **Average Type**. = **Power** are recommended, as already stated. In other cases, operation is often not quite as good but still highly effective. Other **Detector** options, when available, behave as follows:

Positive Peak The noise floor is estimated based on the RBW and the duration of the bucket using

	the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage **Positive Peak** is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise For pulsed-RF, **Positive Peak** can still give excellent effectiveness FFT analysis does not work well, and does not perform NFE well, with pulsed-RF signals, so this combination is *not* recommended
Negative Peak	Not very useful
Sample	Works well, but never better than **Average** , because it does not smooth as well
Normal	A combination of peak and negative peak behaviors, and works about as well as these

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points makes the buckets longer.

For best operation, **Average Type** = **Power** (`RMS`) is optimal (when this option is available). When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. Using NFE with **Average Type** = **Log-Power** (`LOG`) is not synergistic, though; NFE with **Average Type** = **Power** (`RMS`) works a little better than NFE with `LOG`.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that exceeds the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Recalibration of Noise Floor

In instruments with the NF2 license installed, the calibrated noise floor used by **Noise Floor Extension** should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. To do this, use "Characterize Noise Floor" on page 2128, under **System**, **Alignments**, **Advanced**. If you have not done this yourself at the recommended interval, then when you turn on **Noise Floor Extension**, the instrument will prompt you to do so with a dialog stating:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week

If you cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

IF Gain

Sets the **IF Gain** function to one of:

Setting	SCPI	Comments
Auto	AUTO = ON	Auto
Low	OFF AUTO = OFF	Low Gain
High	ON AUTO = OFF	High Gain

This setting affects sensitivity and IF overloads. It only applies to the RF input; not to the baseband I/Q input.

Remote Command	`[:SENSe]:OBWidth:IF:GAIN[:STATe] ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:IF:GAIN[:STATe]?`
	`[:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe] ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe]?`

Example	`:OBW:IF:GAIN ON`
	`:OBW:IF:GAIN?`
	`:OBW:IF:GAIN:AUTO OFF`
	`:OBW:IF:GAIN:AUTO?`

Dependencies	Has no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed-out nor any SCPI locked out. The instrument simply behaves as though both IF Gain is set to Low regardless of the setting on the control Not available in VXT models M9420A/10A/11A, EXM, or UXM
Couplings	**Auto** sets **IF Gain** to High (ON) under any of the following conditions: – The input attenuator is set to 0 dB, or – The preamp is turned on and the frequency range is under 3.6 GHz For other conditions, **Auto** sets **IF Gain** to Low (OFF)
Preset	OFF OFF
State Saved	Saved in instrument state
Range	Low Gain | High Gain

3.4.8.5 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "Global Center Freq" on page 2013) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to `ON`, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched `ON`, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is `ON`, modifies the **Global Center Freq**.

When **Global Center Freq** is switched `OFF`, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is `ON`, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL|NONE`

Preset	`OFF`
Backwards Compatibility SCPI	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`

Global EMC Std

When this control is switched ON, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is ON modifies the **Global EMC Std**.

When **Global EMC Std** is switched OFF, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is ON, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to OFF when "Restore Defaults" on page 2016 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:EMC:STANdard ALL | NONE` `:INSTrument:COUPle:EMC:STANdard?`
Example	`:INST:COUP:EMC:STAN ALL` `:INST:COUP:EMC:STAN?`
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Global Limit Lines (Freq and Amptd)

When this control is set to ALL, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use **Global Limit Lines**, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global** Settings, while **Global Limit Lines** is ALL, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to NONE, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is ALL, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to NONE when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote	`:INSTrument:COUPle:LLINe ALL | NONE`

Command	`:INSTrument:COUPle:LLINe?`
Example	`:INST:COUP:LLIN ALL | NONE` `:INST:COUP:LLIN?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned `ON`, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to `OFF` when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON|OFF`

Restore Defaults

Resets all functions in the **Global** settings menu to `OFF`. Pressing **System**, **Restore Defaults**, **All Modes** has the same effect.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.4.9 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.4.9.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE Significantly faster sweep times are available with Option FS1.

NOTE The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

NOTE On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same “Sweep Time” as you would for sweeping hardware, send `[:SENSe]:<meas>:SWEep:TIME <time>`. The measurement emulates the “Sweep Time” effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.

Remote Command	`[:SENSe]:<meas>:SWEep:TIME <time>` `[:SENSe]:<meas>:SWEep:TIME?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME 25ms`
	`:CHP:SWE:TIME?`

Notes	In the ACP measurement in WCDMA Mode, this parameter is preset by **Meas Method** selection. Preset values are as follows: – IBW: 29 ms – IBWR: 108 ms – FAST 7.5 ms
Dependencies	On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time In those instruments, "Minimum Acquisition Time" on page 1087 is available
Couplings	Coupled to **Span**, **RBW**, **VBW**, and **Sweep Time Rules** when **Sweep Time** is set to Auto; **Sweep Time** changes when these parameters are changed When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically Calculated unless noted below WCDMA Mode – Channel Power: 1.0 msOBW: 32.6 ms – ACP: 29 ms
State Saved	Saved in instrument state
Min	Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when **Meas Method** is **Fast Power**, the minimum sweep time is span-dependent and automatically calculated
Max	Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points)

	A "#" mark appears before "Sweep" in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register: `STATus:QUEStionable:INTegrity:UNCalibrated`

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:TIME:AUTO OFF | ON | 0 | 1` `[:SENSe]:<meas>:SWEep:TIME:AUTO?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME:AUTO OFF`
	`:CHP:SWE:TIME:AUTO?`

Preset	WCDMA Mode: `OFF` All others: `ON`

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each "chunk" of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

~(>~Minimum Acquisition Time) * (The number of chunks)

When in Auto, this parameter's value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time>`
	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`

Example	Channel Power measurement `:CHP:SWE:ACQ:TIME 500 ms`

	:CHP:SWE:ACQ:TIME?
Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to **Span**, **RBW**, and **VBW** when in the Auto state When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically calculated
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Auto Function

Remote Command	[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO OFF | ON | 0 | 1 [:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO? <meas> is the identifier for the current measurement; any one of CHPower-|ACPower|OBWidth|MONitor
Example	Channel Power measurement: :CHP:SWE:ACQ:TIME:AUTO OFF
Preset	ON

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "More Information" on page 830

Remote Command	:INITiate:CONTinuous OFF | ON | 0 | 1 :INITiate:CONTinuous?
Example	Put instrument into **Single** measurement operation: :INIT:CONT 0 :INIT:CONT OFF Put instrument into **Continuous** measurement operation: :INIT:CONT 1 :INIT:CONT ON
Preset	ON Note that :SYST:PRES sets :INIT:CONT to ON, but *RST sets :INIT:CONT to OFF
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting:

	– A line with an arrow is **Single** – A loop with an arrow is **Continuous**
Backwards Compatibility Notes	X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and `INIT:CONT ON`) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument keeps sweeping See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**
Single Mode	The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

– `:INIT:CONT 1` has no effect

– `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state

See "Restart" on page 2018 for details of `:INIT:IMMediate`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "More Information" on page 832

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards	For Spectrum Analysis Mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command

Compatibility Notes	restarted trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **MaxHold** and **MinHold** traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k. This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N, as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K, shows the count for the sweep (data acquisition) in progress. K = k + 1, with a limit of N. The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** un-pauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If :`INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :`INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support this command
Status Bits/OPC dependencies	The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the Abort command will cause the `*OPC` query to return true

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	`[:SENSe]:<meas>:SWEep:ETIMe?` `<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`
Example	Channel Power measurement `:CHP:SWE:ETIMe?`
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.4.9.2 Sweep Config

Accesses controls that let you configure the sweep and control functions of the instrument, such as "Sweep Time Rules" on page 835.

Sweep Time Rules

Switches the instrument between normal and accuracy sweep states:

Accy	`ACCuracy`
Norm	`NORMal`

Setting **Auto Sweep Time** to **Accy** results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **Accy**.

Additional amplitude errors which occur when **Auto Sweep Time** is set to **Norm** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **Norm** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **Norm** on a **Preset**. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

Remote Command	`[:SENSe]:OBWidth:SWEep:TIME:AUTO:RULes NORMal | ACCuracy` `[:SENSe]:OBWidth:SWEep:TIME:AUTO:RULes?`
Example	`:OBW:SWE:TIME:AUTO:RUL NORM`

	:OBW:SWE:TIME:AUTO:RUL?
Dependencies	Does not appear in Spectrum Analyzer Mode in VXT model M9420A
Preset	NORMal
State Saved	Saved in instrument state
Range	NORMal|ACCuracy

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution will change. Trace data for all the traces will be cleared and, if **Sweep** is in **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Due to sweep time quantization issues, the knob and up/down keys *cannot* be used to adjust the number of points.

When in a split-screen display, each window may have its own value for points.

When sweep **Points** is changed, an informational message "Sweep points changed, all traces cleared" is displayed, and in 5G NR Mode, **Auto Sweep Point**s is set to OFF (0).

Remote Command	[:SENSe]:OBWidth:SWEep:POINts <integer> [:SENSe]:OBWidth:SWEep:POINts?
Example	:OBW:SWE:POIN 501 :OBW:SWE:POIN?
Dependencies	Not available when **Signal ID** is set to On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given

	Not displayed in Modes that do not support Swept
Couplings	Whenever the number of sweep points change: – All trace data is erased – Any traces with **Update Off** will also go to **Display Off**Sweep time is re-quantized – Any limit lines that are on will be updated – If averaging/hold is on, averaging/hold starts over – **Auto Sweep Points** is set to `OFF` (5G NR Mode only) The resolution of setting the sweep time depends on the number of points selected
Preset	**Mode** / **Value**: MSR, LTEAFDD, LTEATDD: 2001 5GNR: Automatically calculated All Others: 1001
State Saved	Saved in instrument state
Min	101
Max	20001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	`[:SENSe]:SWEep:IF:DITHer OFF | ON | 0 | 1` `[:SENSe]:SWEep:IF:DITHer?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`OFF`
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	`[:SENSe]:SWEep:IMAGeprot OFF | ON | 0 | 1` `[:SENSe]:SWEep:IMAGeprot?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`ON`
State Saved	Saved in instrument state

3.4.10 Trace

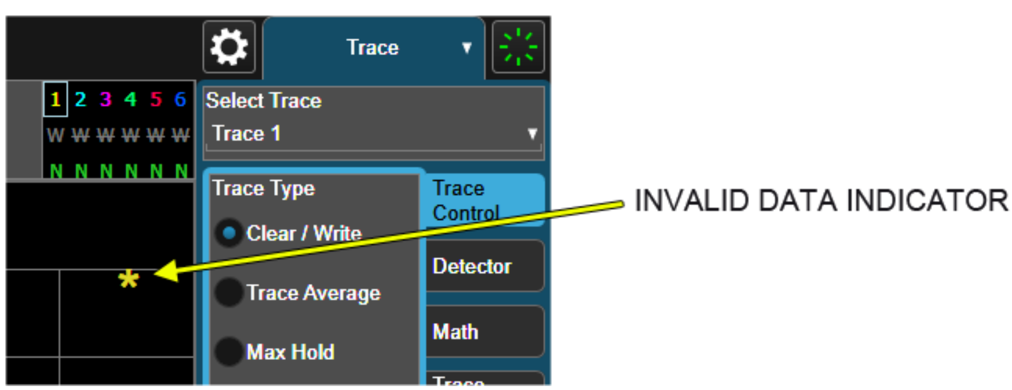
Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces.

The "Trace Control" on page 1904 tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

A trace is a series of data points, each having an x and a y value. The x value is frequency (or time, in zero span) and the y value is amplitude. Each data point is referred to as a *trace point*. In any given trace, trace point 0 is the first point, and trace point (*sweep_points – 1*) is the last. For example, in a 1001 point trace, the first point is 0 and the last is 1000. Another term sometimes used to describe traces is *bucket*. A bucket is the frequency span of a trace point, equal to the point spacing. For swept analysis, the y value in each bucket is measured while the instrument is sweeping across the bucket. The selected detector determines how it is measured.

When in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true on multiple screens. The marker and trace data will be present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data will be present until the next acquisition is completed.

Invalid Data Indicator



The Invalid Data Indicator is displayed whenever the data on the display does not match the settings of the instrument. The most common example of this is when instrument settings have changed in the time since the data in the traces on the display was taken. This means that the screen annotation cannot be guaranteed to match the trace data. For example, if you change **Center Frequency**, the Invalid Data Indicator will display until the trace has been retaken.

If any Trace is in View mode (displaying but not updating) and instrument settings are changed, the Invalid Data Indicator will display as long as that trace remains in View. Traces that are blanked do not turn on the Invalid Data Indicator.

Not all instrument settings require display of the invalid data indicator when they change; only changes that require a new acquisition will cause it to display. For example, changing the Y-Axis scale of the instrument does not cause the invalid data indicator to display, unless the attenuation changes.

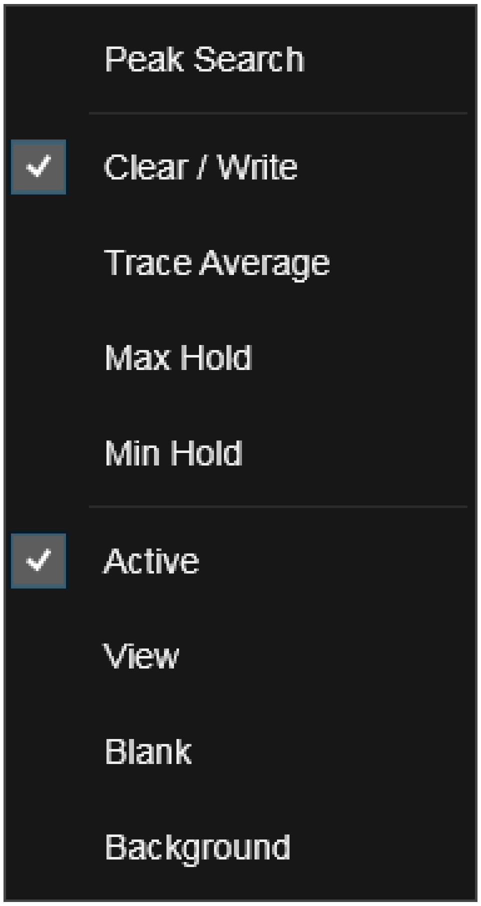
The Invalid Data Indicator is also turned on:

- When the counter is turned on, until the completion of the first count
- When a trace is imported from mass storage and the trace's parameters do not match the current instrument settings
- When a trace is sent to the instrument from a remote interface (since there is no way to know if its settings match)

NOTE **The Invalid Data Indicator has an associated status bit that can be checked at any time to determine whether the indicator is on.**

Trace right-click menu

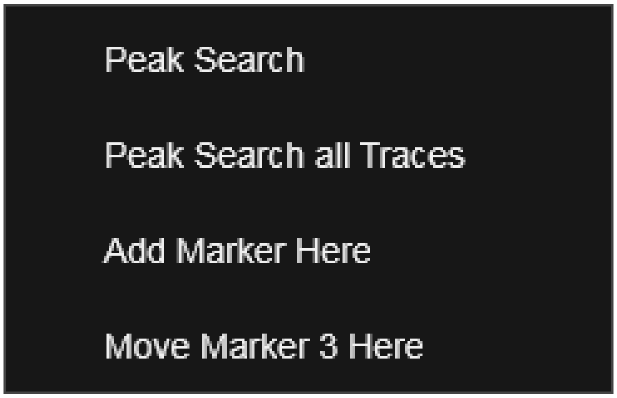
If you right-click on a trace (or touch and hold a trace and wait for the circle to close) you will see the Trace Right-Click Menu:



If you now tap or click on one of the items in this menu, the instrument will perform the corresponding function. **Peak Search** finds the highest peak on the selected Trace. **Clear/Write**, **Trace Average**, **Max Hold** and **Min Hold** set the "Trace Type" on page 1905. **Active**, **View**, **Blank**, and **Background** set the "View/Blank" on page 1721 type.

Waterfall Window

If you right-click on the trace (or touch and hold the trace and wait for the circle to close) in the **Waterfall** window (for example, in the Spectrogram View) you will see the Waterfall Trace Right-Click Menu:



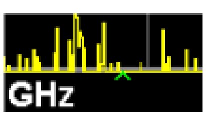
In this menu, **Peak Search** works as above. **Peak Search all Traces** finds the highest peak in the Waterfall window. **Add Marker Here** takes the lowest numbered Marker that is currently Off and turns it On as a **Normal** marker in the Waterfall window at the point where you right-clicked (or touched-and-held). **Move Marker n Here** moves the currently selected Marker to the point in the Waterfall window where you right-clicked (or touched-and-held).

Trace Update Indicator

Trace updates can take one of two forms:

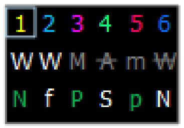
1. The trace is updated in a single operation that affects all of the points in the trace at once. This happens, for example, in the case of very fast (< 200 ms) sweeps, single-chunk FFT's, and the initial math operation after a math function is set for a trace
2. The trace is updated in a series of discrete steps, with measurement data being gathered between each step. This will be the case for slow sweeps, multi-chunk FFTs, gated sweeps, etc.

In the first case, no update indicator is required. In the second case, however, a visual indicator exists on the trace where the new data is being written. The indicator is a green caret (^) , which moves across the bottom of the graticule showing the current trace point.



Trace Annunciator Panel

This panel appears on the right hand side of the Meas Bar. Here is an explanation of the fields in this panel, as shown below:



Top Line

On the top line, each trace number is shown, in the trace color. A box is drawn around the currently selected trace.

Middle Line

Below each trace number, is a letter signifying the trace type for that trace number, where

W	Clear/Write
A	Trace Average
M	Max Hold
m	Min Hold

If the letter is white, it means the trace is being updated (**Update** = ON); if the letter is dimmed , it means the trace is not being updated (**Update** = OFF). A strikethrough indicates that the trace is blanked (**Display** = OFF). Note that it is possible for a trace to be updating *and* blanked, which is useful if the trace is a trace math component.

Bottom Line

The third line shows the detector type for each trace, or, if trace math is on for that trace, it shows “f” (for “math function”). It is not always possible to have a unique detector for each trace, but the instrument hardware provides the maximum flexibility of detector selection in order to maintain the highest accuracy. The letters used for this readout are

N	Normal
A	Average
P	peak
p	negative peak
S	Sample
Q	Quasi Peak
E	EMI Average
R	RMS Average
f	math function

If the letter is green, the detector is in Auto. If white, the detector has been manually selected.

In the example above, the panel is indicating the following:

- Trace 1: Visible, being updated, in Clear/Write, with Normal detector auto selected
- Trace 2: Visible, being updated, in Clear/Write, being written to with a math function
- Trace 3: Visible, not updating, data was taken in Max Hold, with the peak detector auto selected
- Trace 4: Blanked, not updating, data was taken with Averaging turned on, Sample detector manually selected
- Trace 5: Visible, not updating, data was taken in Min Hold with Negative Peak detector auto selected
- Trace 6: Blanked, not updating, in Clear/Write, with Normal detector manually selected

Trace Annotation

When **Trace Annotation** (see **Display**) is `ON`, each non-blanked trace is labeled on the trace with the detector used to take it, unless a Trace Math function is on for that trace, in which case it is labeled with the "Math Function" on page 1724.

The detector labels are:

`NORM`	Normal
`PEAK`	Peak
`SAMP`	Sample
`NPEAK`	Negative Peak
`RMS`	Average detector with Power Average (RMS)
`LG AVG`	Average detector with Log-Pwr Average
`VAVG`	Average detector with Voltage Average
`QPEAK`	Quasi Peak
`EMI AVG`	EMI Average
`RMS AVG`	RMS Average

The trace math labels are:

`PDIF`	Power Difference
`PSUM`	Power Sum
`LOFF`	Log Offset
`LDIF`	Log Difference

3.4.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Dependencies	For the Swept SA measurement: – In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View – When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when **Meas Method** is `RBW`, `FAST` or `FPOWer`, **Select Trace** is disabled
Preset	Trace 1
State Saved	Yes

3.4.10.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 1905 and its update mode.

There are four Trace Types:

- **Clear/Write**
- **Trace Average**
- **Max Hold**
- **Min Hold**

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display,** are described fully in the "View/Blank" on page 1721 control description. Essentially, when **Update** is `ON`, a trace is updating, and when **Update** is `OFF` it is not. When **Display** is `ON`, it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	WRITe	:TRAC2:TYPE WRIT	See: "Clear/Write" on page 848
Trace Average	AVERage	:TRAC2:TYPE AVER	See: "Trace Average" on page 848
Maximum Hold	MAXHold	:TRAC3:TYPE MAXH	See: "Max Hold" on page 849
Minimum Hold	MINHold	:TRAC5:TYPE MINH	See: "Min Hold" on page 849

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "View/Blank" on page 1721 state must be set to **Active** (**Update**: ON, **Display**: ON) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "Trace Mode Backwards Compatibility Commands" on page 846

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|…|6:TYPE?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:TYPE WRITe | AVERage | MAXHold | MINHold`
	`:TRACe[1]|2|3:<meas>:TYPE?`
	where `<meas>` is the identifier for the current measurement

Example	`:TRAC:TYPE WRIT` `:TRAC:TYPE?`
Couplings	Selecting a **Trace Type** (by pressing any of the Trace Type selections or sending `:TRAC:TYPE`) sets the Trace to **Active** (**Update**: ON, **Display**: OFF), even if the same trace type was already selected When Detector setting is “Auto” (`[:SENSe]:<meas>:DETector:AUTO?`), Detector (`[:SENSe]:<meas>:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: “NORMal” with WRITe (Clear Write), “AVERage” with AVERage, “POSitive (peak)” with MAXHold, and “NEGative (peak)” with MINHold
Preset	Swept SA and Monitor Spectrum: WRITe All other measurements: AVERage Following **Preset**, all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the “Trace Modes” were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "View/Blank" on page 1721.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The :`TRACe:MODE` command is retained for backwards compatibility, and the :`TRACe:TYPE`, :`TRACe:UPDate` and :`TRACe:DISPlay` commands introduced for ongoing use. The old Trace Modes are selected using `:TRAC:MODE`, whose parameters are mapped into calls to `:TRACe:TYPE`, `:TRACe:UPDate` and `:TRACe:DISPlay`, and the old global Averaging command `[:SENSe]:AVERage[:STATe]` is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup**, **Legacy Compatibility** menu is `ON`, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or `:INIT:IMM`, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	`WRITe`
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	`:TRACe[1]|2|…|6:MODE WRITe | MAXHold | MINHold | VIEW | BLANk` `:TRACe[1]|2|…|6:MODE?`
Backwards Compatibility Notes	The legacy `:TRACe:MODE` command is retained for backwards compatibility. In conjunction with the legacy `:AVERage` command, it works as follows: – `:AVERage ON|OFF` sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the `[:SENSe]:AVERage[:STATe]` command description below – `:TRACe:MODE WRITe` sets `:TRACe:TYPE WRITe` (Clear/Write) unless average is true, in which case it sets it to `:TRACe:TYPE AVERage`. It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE MAXHold` sets `:TRACe:TYPE MAXHold` (Max Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace

	– `:TRACe:MODE MINHold` sets `:TRACe:TYPE MINHold` (Min Hold). It also sets `:TRACe:UPDate ON`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace – `:TRACe:MODE BLANk` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace The query returns the same value as `:TRACe:TYPE?`, meaning that if you set `:TRACe:MODE:VIEW` or `:TRACe:MODE:BLANk`, the query response will not be what you sent `:TRACe[n]:MODE` was formerly used to set the type or "writing mode" of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold** As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does Also, previous to X-Series: – Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence – Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case
Preset	`OFF`
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	`[:SENSe]:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:AVERage[:STATe]?`
Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command `[:SENSe]:AVERage[:STATe] ON|OFF|1|0` was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command `[:SENSe]:AVERage[:STATe] OFF|ON|0|1.` When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average, Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average, Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup.**

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like Center Frequency or Attenuation), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated

- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup.**

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold,** clears the trace , initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold,** clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

– The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data

– A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1905 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again – the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

– **Clear/Write**: Clear and Write

– **Trace Average**: Restart Averaging

– **Max Hold**: Restart Max Hold

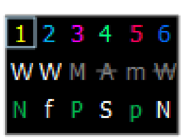
– **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF; Display ON
Blank	Update OFF; Display OFF
Background	Update ON, Display OFF Allows a trace to be blanked *and* continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **Display**OFF is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **Update**OFF is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **Update**OFF, and Traces 4 and 6 have **Display**OFF.



See: "More Information" on page 852

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 851 and "Trace Display State On/Off" on page 851 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update ON and Display ON), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending [:SENS]:DET:TRAC) puts the trace in **Active** (**Update**ON and **Display**ON), even if that detector was already selected Selecting a "Math Function" on page 1724 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (**Update**ON and **Display**ON), even if that Math Mode was already selected Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:UPDate[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 2 inactive (stop updating): `:TRAC2:UPD 0`
Couplings	Whenever you set **Update** to ON for any trace**,** the **Display** is set to ON for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	ON for Trace 1; OFF for 2–6
	For all other measurements:
	`1|0|0`
	ON for Trace 1; OFF for 2 &3

State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:DISPlay[:STATe]?`
	For all other measurements:

	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 1 visible:
	`:TRAC2:DISP 1`
	Blank trace 3:
	`:TRAC3:DISP 3`

Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	ON for Trace 1; OFF for 2–6
	For all other measurements:
	`1|0|0`
	ON for Trace 1; OFF for 2 &3

State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display**=OFF) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update**=ON), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display**=OFF and/or **Update**=OFF does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.4.10.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1730 controls.

– See "How trace math is processed" on page 857

Remote Command	For option details, see "Trace Math Options" on page 855
	For Swept SA Measurement (in SA Mode):
	`:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate:MATH? <trace_num>`
	where `<trace_num>` is any one of:
	`TRACE1|…|TRACE6`
	For all other measurements:
	`:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>`
	`:CALCulate[:<meas>]:MATH? <trace_num>`
	where:
	`<meas>` is the identifier for the current measurement, and
	`<trace_num>` is any one of:
	`TRACe1|TRACe2|TRACe3`
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0`
	Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

	Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB
	`:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
	Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm
	`:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0`
	Turns off trace math for trace 1

Notes	The Trace Math Function command has 6 main set of parameters:
	- Set 1 defines the "result trace":
	`TRACE1|…|TRACE6`
	-Set 2 defines the "function":
	`PDIFference|PSUM|LOFFset|LDIFference|OFF`
	- Set 3 is a "trace operand" (1):
	`TRACE1|…|TRACE6`
	- Set 4 is a "trace operand" (2):
	`TRACE1|…|TRACE6`
	- Set 5 defines the "Log Offset" (in dB)
	- Set 6 defines the "Log Difference Reference" (in dBm)
	Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function
	The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message
	The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas

Dependencies	Trace Math is not available if **Normalize** is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = ON; and Update = ON

Preset	For Swept SA Measurement (in SA Mode):
	`OFF,TRACE5,TRACE6,0,0 | OFF,TRACE6,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0 | OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE4,0,0 | OFF,TRACE4,TRACE5,0,0`
	For all other measurements:
	`OFF,TRACE2,TRACE3,0,0 | OFF,TRACE3,TRACE1,0,0 | OFF,TRACE1,TRACE2,0,0`

State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An "f" is shown on the trace annunciation panel in the Measurement Bar when a math function is on;

	and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the First Trace operand and the Second Trace operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in FirstTrace is equal to maxtracevalue, the resultant point is also maxtracevalue.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is mintracevalue.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

```
DestinationTrace = FirstTrace + Offset
```

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-

B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = (FirstTrace - SecondTrace) + Reference
```

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

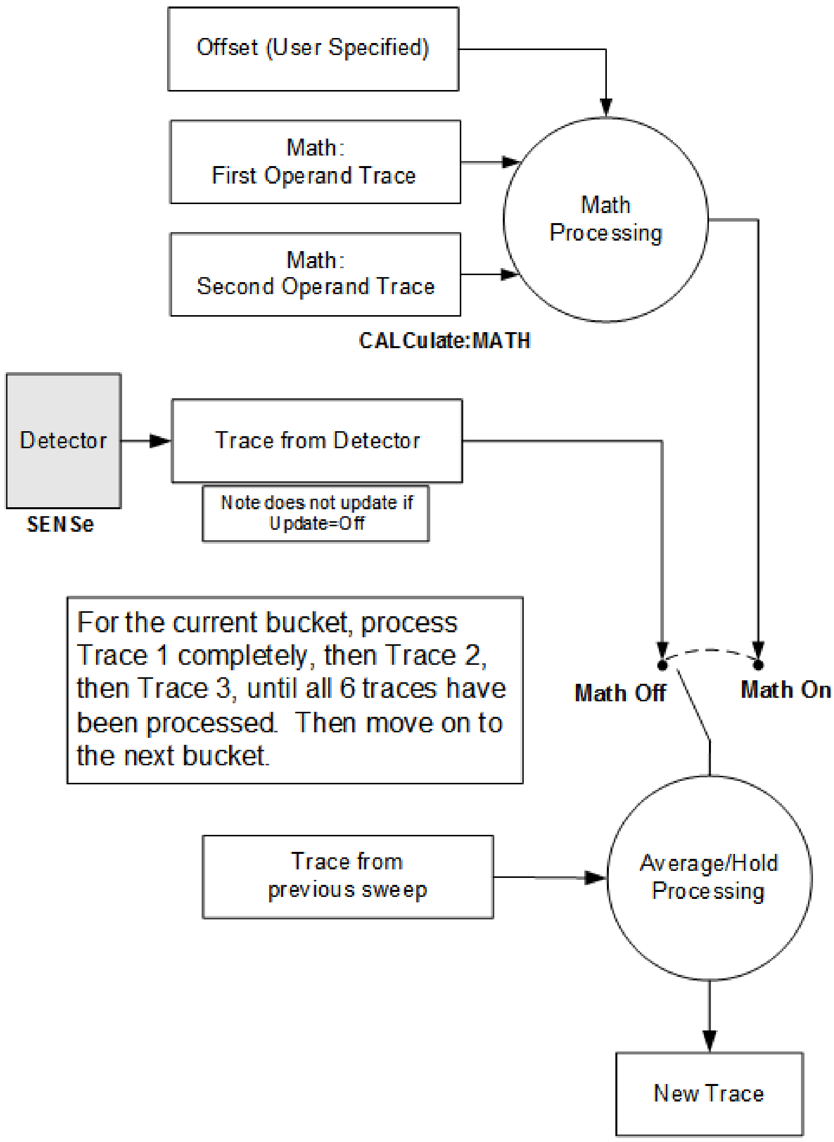
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement
	Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See "Math Function" on page 1724 for how to specify Operands 1 and 2 using `:CALCulate:MATH`
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.4.10.4 Detector

Lets you select and configure detectors for the specified trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following selections are available:

Option	Behavior
AUTO	The detector selected depends on marker functions, trace functions, average type,

Option	Behavior
	and the trace averaging function For details, see "Detector Select Auto/Man" on page 862
NORMal	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
AVERage	The detector determines the average of the signal within the sweep points, using RMS averaging
POSitive Peak	The detector determines the maximum of the signal within the sweep points
SAMPle	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
NEGative Peak	The detector determines the minimum of the signal within the sweep points
RMS	Equivalent to AVERage

Because they may not find a spectral component's true peak, neither AVERage nor SAMPle detectors measure amplitudes of CW signals as accurately as POSitivePeak or NORMal, but they do measure noise without the biases of peak detection.

Remote Command	[:SENSe]:OBWidth:DETector[:FUNCtion] NORMal | AVERage | POSitive | SAMPle | NEGative | RMS [:SENSe]:OBWidth:DETector[:FUNCtion]?
Example	:OBW:DET NORM :OBW:DET? Set the detector to **Average**. **Average** uses RMS averaging, so this is equivalent to selecting an RMS detector: :OBW:DET RMS
Notes	The query returns a name that corresponds to the detector type, as follows The RMS selection sets the detector type to AVERage, with RMS averaging. Therefore, if RMS had been selected, the query returns AVER

String Returned	Definition
NORM	Normal
AVER	Average (RMS)
POS	Peak
SAMP	Sample
NEG	Negative Peak

Couplings: When "Detector Select Auto/Man" on page 862 is ON, the values returned by the query depend on the setting of "Trace Type" on page 1905 as follows:

	Trace Type / **Query Returns:** WRITe → NORMal AVERage → AVERage MAXHold → POSitive MINHold → NEGative
Preset	AVERage
State Saved	Saved in instrument state
Range	NORMal|AVERage|POSitive|SAMPle|NEGative|RMS

Trace Type	Query Returns:
WRITe	NORMal
AVERage	AVERage
MAXHold	POSitive
MINHold	NEGative

Detector Select Auto/Man

Sets the Detector mode to **Auto** (ON) or **Man** (OFF). In **Auto**, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you select any "Detector" on page 860 manually, this setting reverts automatically to **Man** (manual).

Remote Command	`[:SENSe]:OBWidth:DETector:AUTO ON | OFF | 1 | 0` `[:SENSe]:OBWidth:DETector:AUTO?`
Example	`:OBW:DET:AUTO ON` `:OBW:DET:AUTO?`
Couplings	When ON, the query "Detector" on page 860 returns values that depend on the setting of "Trace Type" on page 1905 as follows:
Preset	ON
State Saved	Yes

Trace Type	Query Returns:
WRITe	NORMal
AVERage	AVERage
MAXHold	POSitive
MINHold	NEGative

3.4.10.5 Trace Function

Contains controls to:

– Copy and Exchange traces

– Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1732 when a "Copy" on page 1732 or "Exchange" on page 1733 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the "From Trace" on page 1732 when a "Copy" on page 1732 or "Exchange" on page 1733 is performed

Preset	2

Copy

Executes a Trace Copy based on the "From Trace" on page 1732 and "To Trace" on page 1732 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On `:TRAC:COPY TRACE1,TRACE3`
Notes	The command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1732 and "To Trace" on page 1732 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `:TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Exchange Trace 1 and Trace 2 and put both traces in Update=OFF, Display=ON: `:TRAC:EXCH TRACE1,TRACE2`
Notes	The command is of the form: `:TRACe:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in **View** (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = OFF.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.4.10.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a `:READ` or `:FETCh` query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:<meas>:MTRace TRACe1 | TRACe2 | TRACe3`
	`:CALCulate:<meas>:MTRace?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower | ACPower | OBWidth | SEMask | SPURious | PVTime`

Example	Channel Power
	`:CALC:CHP:MTR TRAC1`
	`:CALC:CHP:MTR?`

Dependencies	In the ACP measurement, this control is grayed-out when **Meas Method** is set to `RBW` or `FAST`, and only Trace 1 is enabled
Preset	`TRACe1`
State Saved	No
Range	Trace 1 | Trace 2 | Trace 3

3.5 ACP Measurement

ACP is a measurement of the amount of interference, or power, in an adjacent frequency channel. The results are displayed as a bar graph or as spectrum data, with measurement data at specified offsets.

Measurement Commands

The general functionality of "CONFigure" on page 2732, "INITiate" on page 2733, "FETCh" on page 2733, "MEASure" on page 2735, and "READ" on page 2734 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

The following measurement commands and queries are used to configure the measurement:

`:INITiate:ACPower`	Initiates a trigger cycle for the `ACPower` measurement, but does not return any data. You must then use `:FETC:ACP[n]?` to retrieve data Does not change any measurement settings
`:CONFigure?`	Returns the long form name of current measurement, in this case, `ACPower`
`:CONFigure:ACPower`	Selects ACP measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 1004
`:CONFigure:ACPower:NDEFault`	Selects ACP measurement *without* affecting settings

The following queries are used to retrieve the results:

`:FETCh:ACPower?`	Retrieves the data specified by n
`:MEASure:ACPower[n]?`	Switches to ACP measurement, restores default values, starts the measurement, then retrieves the data specified by n
`:READ:ACPower[n]?`	Starts the measurement, then retrieves the data specified by n

Remote Command Results

The following table describes the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value `n`.

n	Results Returned
1, or not specified	Dependent on **Mode**, "Meas Method" on page 963, "Power Ref" on page 1045 , and "Measurement Type" on page 1045 See "Measurement Results for n = 1, or no Index Specified" on page 868
2	Dependent on "Measurement Type" on page 1045. See "Measurement Results for n = 2" on page 872
3	Dependent on **Mode** and "Measurement Type" on page 1045. See "Measurement Results for n = 3" on page

n	Results Returned
	873
4	Returns `<Num Pts>` comma-separated scalar values representing the Y values in Trace 1
5	Returns `<Num Pts>` comma-separated scalar values representing the Y values in Trace 2
6	Returns `<Num Pts>` comma-separated scalar values representing the Y values in Trace 3
7	Dependent on **Mode** and "Measurement Type" on page 1045. See "Measurement Results for n = 7" on page 874
8	Only available in LTEAFDD, LTEATDD, 5GNR, MSR Modes Dependent on "Measurement Type" on page 1045, "PSD Unit" on page 1053, and "Power Ref" on page 1045. See "Measurement Results for n = 8" on page 875
9	Only available in LTEAFDD, LTEATDD, 5GNR, MSR Modes Returns scalar pass/fail values (0 = passed, or 1 = failed) for the trace specified by "Measure Trace" on page 1734, determined by comparing the relative to the reference carrier and by testing the absolute power limit of the offset frequencies

#	Item
1	Inner Lower offset A - relative limit result
2	Inner Lower offset A - absolute limit result
3	Inner Upper offset A - relative limit result
4	Inner Upper offset A - absolute limit result
5	Inner Lower offset B - relative limit result
6	Inner Lower offset B - absolute limit result
7	Inner Upper offset B - relative limit result
8	Inner Upper offset B - absolute limit result
...	...

When "Max Num of Offsets" on page 1000 is 6, returns 24 results (Offset A-F: 24 = 4*6) and when set to 12, returns 48 results (Offset A-L: 48 = 4 * 12)

n	Results Returned
10	Only available in LTEAFDD, LTEATDD, 5GNR, MSR Modes Returns scalar values of offset results for the trace specified by "Measure Trace" on page 1734 Numbers returned in this trace are 10 x the actual measured offsets. Note that upper and lower sides of an offset are returned separately. For example, when only outer offset A is measured with offset side both, 10 x 2 = 20 values are returned In the table below, f is the Number of Offsets. See "Max Num of Offsets" on page 1000

#	Measurement Type	Item	Unit, if any
1		Inner = 1 or Outer = 2	
2		Offset A~L. (A = 1, B = 2, ... L = 12)	
3		Offset Side. Lower = 1 or Upper = 2	

n	Results Returned			
	#	**Measurement Type**	**Item**	**Unit, if any**
	4	TPRef	Relative power or	dBc
		PSDRef	Relative PSD	dB
	5	TPRef	Absolute power	dBm
		PSDRef	Absolute PSD	dBm/Hz, dBm/MHz*
	6	TPRef	Reference power	dBm
		PSDRef	Reference PSD	dBm/Hz, dBm/MHz*
	7		Reference Index 1	
	8		Reference Index 2	
	9		0 (Reserved)	
	10		0 (Reserved)	
	…			
	10(f - 1) + 1		Inner = 1 or Outer = 2	
	10(f - 1) + 2		Offset A~L. (A = 1, B = 2, … L = 12)	
	10(f - 1) + 3		Offset Side. Lower = 1 or Upper = 2	
	10(f - 1) + 4	TPRef	Relative power	dBc
		PSDRef	Relative PSD	dB
	10(f - 1) + 5	TPRef	Absolute power	dBm
		PSDRef	Absolute PSD	dBm/Hz, dBm/MHz*
	10(f - 1) + 6	TPRef	Reference power	dBm
		PSDRef	Reference PSD	dBm/Hz, dBm/MHz*
	10(f - 1) + 7		Reference Index 1	
	10(f - 1) + 8		Reference Index 2	
	10(f - 1) + 9		0 (Reserved)	
	10(f - 1) + 10		0 (Reserved)	
	"Measurement Type" on page 1045 determines which type of power result is returned: Total Pwr Ref (TPRef) or PSD Ref (PSDRef)			
	*For PSD results, the unit is determined by "PSD Unit" on page 1053: DBMHZ or DBMMHZ			
	If any result is not available, 9.91E+37 (NaN) is returned			

3.5.1 Measurement Results for n = 1, or no Index Specified

Mode = SA, Radio Std = None, Number of carriers = 1, Only Offset A is On

Returns 3 comma-separated values that correspond to:

#	Item	Unit, if any
1	Reference carrier power	
2	Lower-adjacent channel power of the trace specified by "Measure Trace" on page 1734	dBc
3	Upper-adjacent channel power of the trace specified by "Measure Trace" on page 1734	dBc

The values are in the current Y Axis Unit of the instrument

Meas Method = FAST

See also "Meas Method" on page 963

For the trace specified by "Measure Trace" on page 1734, returns 5 comma-separated scalar results in the following order:

#	Item	Result	Unit, if any
1	Reference carrier	Absolute power	dBm
2	Lower offset A	Absolute power	dBm
3	Upper offset A	Absolute power	dBm
4	Lower offset B	Absolute power	dBm
5	Upper offset B	Absolute power	dBm

Measurement Type = Total Power Reference

<table>

	...	...	...
	When "Max Num of Offsets" on page 1000 is 6, returns 28 results (Offset A-F: 28 = 4 + 4*6) and when set to 12, returns 52 results (Offset A-L: 52 = 4 + 4 * 12)		

Conditions	Results
	*The unit is determined by "PSD Unit" on page 1053: DBMHZ or DBMMHZ If any result is not available, -999.0 is returned For SA Mode, the values are in the current Y Axis Unit of the instrument

3.5.2 Measurement Results for n = 2

- For SA Mode, the values are in the current Y Axis Unit of the instrument
- For MSR, LTE Advanced FDD/TDD, and 5G NR Modes, this trace includes only outer offset results and their reference value(s)

Measurement Type = Total power reference

For the trace specified by "Measure Trace" on page 1734, returns comma-separated scalar results in the following order:

#	Item	Result	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm
...	...	...	
23	Channel (12)	Relative power	dB
24	Channel (12)	Absolute power	dBm
25	Lower offset A	Relative power	dB
26	Lower offset A	Absolute power	dBm
27	Upper offset A	Relative power	dB
28	Upper offset A	Absolute power	dBm
29	Lower offset B	Relative power	dB
30	Lower offset B	Absolute power	dBm
31	Upper offset B	Relative power	dB
32	Upper offset B	Absolute power	dBm
...	...	...	

When "Max Num of Offsets" on page 1000 is 6, returns 48 results (Offset A-F: 48 = 24 + 4*6) and when set to 12, returns 72 results (Offset A-L: 72 = 24 + 4 * 12)

If any result is not available, -999.0 is returned

Measurement Type = Power spectral density reference

For the trace specified by "Measure Trace" on page 1734, returns comma-separated scalar results in the following order:

#	Channel	Item	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm/Hz or dBm/MHz*
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm/Hz or dBm/MHz*
...	...	...	
23	Channel (12)	Relative power	dB
24	Channel (12)	Absolute power	dBm/Hz or dBm/MHz*
25	Lower offset A	Relative power	dB
26	Lower offset A	Absolute power	dBm/Hz or dBm/MHz*
27	Upper offset A	Relative power	dB
28	Upper offset A	Absolute power	dBm/Hz or dBm/MHz*
29	Lower offset B	Relative power	dB
30	Lower offset B	Absolute power	dBm/Hz or dBm/MHz*
31	Upper offset B	Relative power	dB
32	Upper offset B	Absolute power	dBm/Hz or dBm/MHz*
...	...	...	

When "Max Num of Offsets" on page 1000 is 6, returns 48 results (Offset A-F: 48 = 24 + 4*6) and when set to 12, returns 72 results (Offset A-L: 72 = 24 + 4 * 12)

*The unit is determined by "PSD Unit" on page 1053: DBMHZ or DBMMHZ

If any result is not available, -999.0 is returned

3.5.3 Measurement Results for n = 3

For the trace specified by "Measure Trace" on page 1734, returns scalar pass/fail values (0 = passed, or 1 = failed) determined by comparing the relative to the reference carrier and by testing the absolute power limit of the offset frequencies (measured as total power in dB if "Measurement Type" on page 1045 is **Total Pwr Ref**, or as power spectral density in dB if **Measurement Type** is **PSD Ref**).

When "Max Num of Offsets" on page 1000 is 6, returns 24 results (Offset A-F: 24 = 4*6). When set to 12, returns 48 results (Offset A-L: 48 = 4 * 12).

For MSR, LTE-Advanced FDD/TDD, and 5G NR Modes, this trace includes only outer offset results.

#	Item
1	Lower offset A - relative limit result
2	Lower offset A - absolute limit result
3	Upper offset A - relative limit result
4	Upper offset A - absolute limit result
5	Lower offset B - relative limit result
6	Lower offset B - absolute limit result
7	Upper offset B - relative limit result
8	Upper offset B - absolute limit result
...	...

If any result is not available, 1 is returned.

3.5.4 Measurement Results for n = 7

In all cases below:

– for SA Mode, the values are in the current Y Axis Unit of the instrument

– if any result is not available, 9.91E+37 (NaN) is returned

Mode	Max Number of Carriers
MSR	100
LTEAFDD, LTEATDD	5
5GNR	16
All Others	18

Measurement Type = Total power reference

For the trace specified by "Measure Trace" on page 1734, returns (2 * Number of Carriers) comma-separated scalar results in the following order:

#	Channel	Result	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm
...	...		
2 * Number of Carriers – 1	Channel (Number of Carriers)	Relative power	dB
2 * Number of Carriers	Channel (Number of Carriers)	Absolute power	dBm

Measurement Type = Power spectral density reference

For the trace specified by "Measure Trace" on page 1734, returns (2 * Number of Carriers) comma-separated scalar results in the following order:

#	Channel	Result	Unit, if any
1	Channel (1)	Relative power	dB
2	Channel (1)	Absolute power	dBm/Hz or dBm/MHz*
3	Channel (2)	Relative power	dB
4	Channel (2)	Absolute power	dBm/Hz or dBm/MHz*
...	...		
2 * Number of Carriers - 1	Channel (Number of Carriers)	Relative power	dB
2 * Number of Carriers	Channel (Number of Carriers)	Absolute power	dBm/Hz or dBm/MHz*

*The unit is determined by "PSD Unit" on page 1053: DBMHZ or DBMMHZ

3.5.5 Measurement Results for n = 8

Only available in LTEAFDD, LTEATDD, 5GNR, MSR Modes

For the trace specified by "Measure Trace" on page 1734, returns scalar results in the following order:

#	Item	Unit, if any
1	0.0	
2	Total carrier power	dBm
3	Reference Power #1 (See "Reference Power Result Details" on page 876)	
4	Reference Power #2 (See "Reference Power Result Details" on page 876)	
5	Inner Lower offset A - relative power	dB
6	Inner Lower offset A - absolute power	dBm, dBm/Hz or dBm/MHz*
7	Inner Upper offset A - relative power	dB
8	Inner Upper offset A - absolute power	dBm, dBm/Hz or dBm/MHz*
9	Inner Lower offset B - relative power	dB
10	Inner Lower offset B - absolute power	dBm, dBm/Hz or dBm/MHz*
11	Inner Upper offset B - relative power	dB
12	Inner Upper offset B - absolute power	dBm, dBm/Hz or dBm/MHz*
...	...	

This trace includes only inner offset results

When "Max Num of Offsets" on page 1000 is 6, returns 28 results (Offset A-F: 24 = 4 + 4*6) and when set to 12, returns 52 results (Offset A-L: 52 = 4 + 4 * 12)

Absolute Power Units

*For Absolute power results, the units depend on the "Measurement Type" on page 1045 and "PSD Unit" on page 1053 settings as follows:

Measurement Type	PSD Unit	Unit
Total Pwr Ref	All	dBm
PSD Reference	dBm/Hz, DBMHZ	dBm/Hz
	dBm/MHz, DBMMHZ	dBm/MHz

Reference Power Result Details

The values returned as Reference Power #1 and Reference Power #2 depend on "Power Ref" on page 1045:

Power Ref Setting	Option	Reference Power #1	Reference Power #2
Left & Right Carriers	LRCarriers	Left or Max Power Carrier in the lower sub-block dBm, dBm/Hz or dBm/MHz*	Right or Max Power Carrier in the upper sub-block dBm, dBm/Hz or dBm/MHz*
Max Power Carriers in Sub-block	MPCSubblock		
Left & Right Sub-blocks	LRSubblocks	Integrated Power of the lower sub-block dBm, dBm/Hz or dBm/MHz*	Integrated Power of the upper sub-block dBm, dBm/Hz or dBm/MHz*
Others		0.0	Reference carrier power dBm, dBm/Hz or dBm/MHz*

*For PSD results, the unit is determined by "PSD Unit" on page 1053. See "Absolute Power Units" on page 876 above

If any result is not available, 9.91E+37 (NaN) is returned

3.5.6 Views

The ACP measurement has two views: "Normal" on page 877 and "Carrier Info" on page 878.

These are multiple-window Views. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is **Frequency**, unless otherwise specified in the View description.

NOTE: **Y Scale/Div, Y Ref Position, Y Auto Scale, Y Ref Value and Bar Graph affect both views. For example, power bars on the traces in both views appear or disappear when Bar Graph is toggled.**

View Selection by Name

Selects the results view. The following command allows you to select the desired measurement view by enumeration.

Remote Command	`:DISPlay:ACPower:VIEW[:SELect] PRESult | CINFormation` `:DISPlay:ACPower:VIEW[:SELect]?`
Example	`:DISP:ACP:VIEW PRES` `:DISP:ACP:VIEW?`
Preset	`PRESult`
State Saved	Saved in instrument state
Range	`PRESult|CINFormation`

View Selection by Number (Remote Command Only)

Selects the results view. The following command allows you to select the desired measurement view by enumeration.

Remote Command	`:DISPlay:ACPower:VIEW:NSELect <integer>` `:DISPlay:ACPower:VIEW:NSELect?`
Example	`:DISP:ACP:VIEW:NSEL 1` `:DISP:ACP:VIEW:NSEL?`
Dependencies	Available only for LTEAFDD, LTEATDD and 5G NR Modes
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.5.6.1 Normal

Windows: "Graph" on page 878, "Metrics" on page 879,

Dual window view of the graph and the metrics.

Example	`:DISP:ACP:VIEW PRES`

3.5.6.2 Carrier Info

Windows: "Graph" on page 878, "Metrics" on page 879,

Dual window view of the graph and the metrics.

Example	`:DISP:ACP:VIEW CINF`

3.5.7 Windows

This section describes the Windows that are available in the ACP measurement.

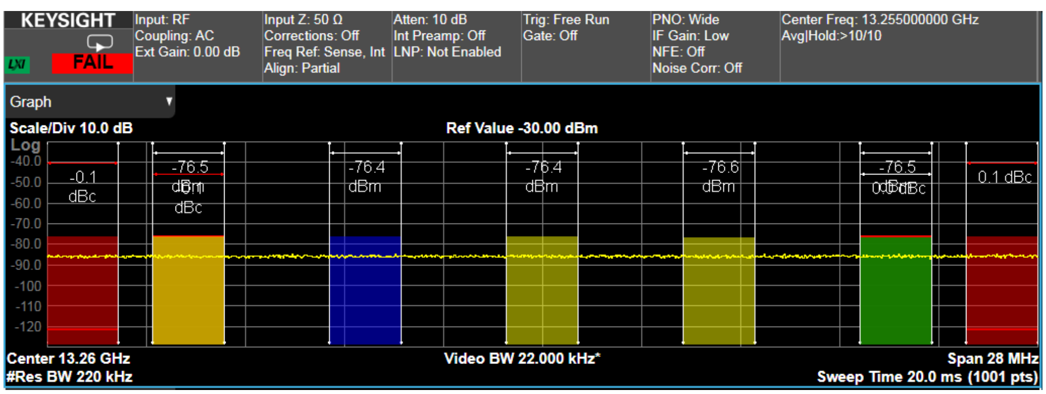
3.5.7.1 Graph

The Graph window is used to display the spectrum being measured by the ACP measurement.

The results of the measurement can be displayed as a single spectrum trace view or displayed with a Bar Graph trace on the spectrum trace.

The Graph window appears in several Views, as follows:

View	Size	Position
Normal	Half, full width	Top
Carrier Info	Half, full width	Top
Gate View	One third, full width	Middle



When the Bar Graph is ON and Limit Test is ON, the color of each bar graph reflects the limit test result. When the limit test fails, the bar color is red, and when limit test passes, the bar color is green.

When RBW is selected as the measurement method, the spectrum trace is not displayed, only the bar graph is displayed. In addition, the Bar Graph control (under the Display front-panel key) is set to ON and is grayed-out.

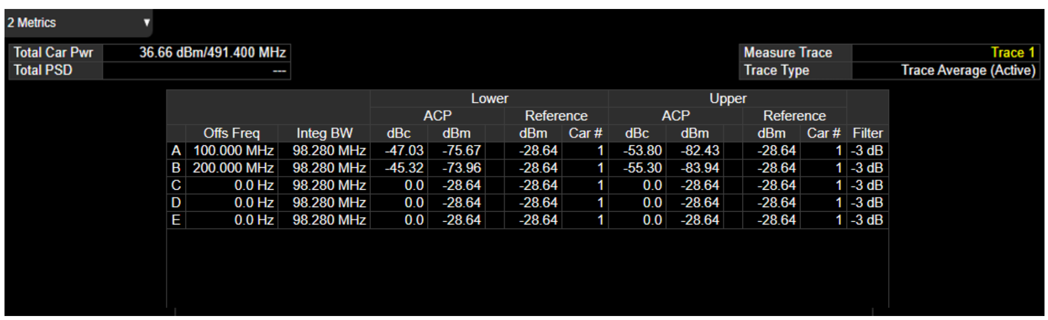
3.5.7.2 Metrics

The Metrics window displays the textual results of the ACP measurement.

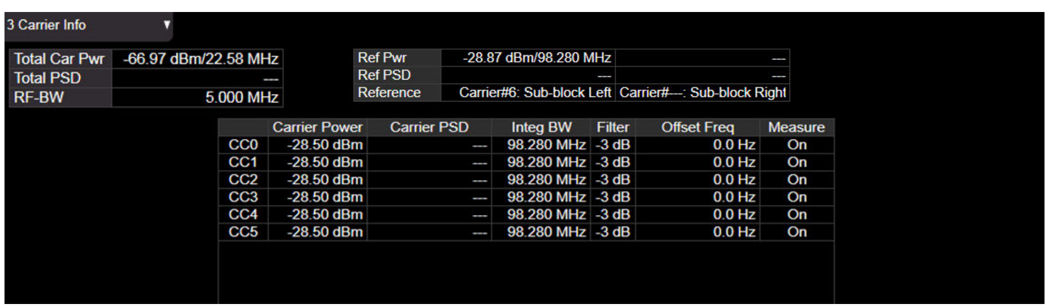
Views in which the Metrics window appears:

View	Size	Position
Normal	Half, full width	Bottom
Carrier Info	Half, full width	Bottom
Gate View	One Third, full width	Bottom

Metrics Window in Normal view:



Metrics Window in Carrier Info view:



The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier power present set to yes. The power is calculated by integrating across the bandwidth declared by the Carrier Integ BW parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC

Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ BW) multiplied by the number of carriers with carrier power present set to yes.

Ref Power

This is the power of the reference. The power is calculated by integrating across the bandwidth defined by the Reference Type. The integration bandwidth is shown as a part of the result. For some Power Reference Type, this is the value of the Carrier Integ BW for that carrier unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Carrier Integ BW).

Reference

In multi-carrier applications, this row displays what is used as a reference power.

Carrier Power

This is the power in all the currently defined carriers. If the carrier has carrier power present, the power will be absolute. If the carrier is defined as not having power present, the power will be relative to the reference carrier. The power is calculated by integrating across the bandwidth declared by the Carrier Integ BW parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ BW for the carrier unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Carrier Integ BW).

Offset Relative Power

This is the power in the offsets relative to the reference carrier. The power is calculated by integrating across the bandwidth declared by the Offset Integ BW parameter. The offset integration bandwidth is shown as part of the result. This is the value on the Offset Integ BW menu unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Offset Integ BW).

Offset Absolute Power

This is the absolute power in the offsets. The power is calculated by integrating across the bandwidth declared by the Offset Integ BW parameter. The offset integration bandwidth is shown as part of the result. This is the value on the Offset Integ BW menu unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Offset Integ BW).

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier whatever their measurement states are on or off.

Integration Bandwidth

Displays the noise bandwidth of each carrier to be measured in the ACP measurement

Measure Trace

See "Measure Trace" on page 1734.

Trace Type

This is the trace type (and view/blank parameter) of a trace specified by Measure Trace.

Measure Trace and Trace Type are displayed only when Meas Method is set to “Integration BW”, “Filtered IBW”, or “Fast Power”

Filter

Indicates whether RRC filter is used for ACP measurement or not.

Offset Frequency

Shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. So far we support the two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column will be displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

3.5.7.3 Gate

Turning on Gate View displays the Gate Window, which allows you to see your Gating signal at the same time as the measured data. See the description under Gate View in the Trigger, Gate Settings section.

View	Size	Position
Gate View	One third, full width	Top

3.5.8 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.5.8.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the **Ref Position** function.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:ACP:WIND:TRAC:Y:RLEV 100` `:DISP:ACP:WIND:TRAC:Y:RLEV?`
Couplings	When "Auto Scaling" on page 890 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to OFF "Attenuation" on page 1932 is not coupled to **Ref Value**
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:ACP:WIND:TRAC:Y:PDIV 5` `:DISP:ACP:WIND:TRAC:Y:PDIV?`

Couplings	Coupled to "Scale Range" on page 1538 as follows: **Scale/Div** = **Scale Range**/10 (number of divisions) When "Auto Scaling" on page 890 is ON, this value is automatically determined by the measurement result When you change a value, **Auto Scaling** automatically changes to Off
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision`

Scale Range

Sets the Y-Axis scale range.

Remote Command	Replace `<meas>` with the identifier for the current measurement
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe <rel_ampl>`
	`:DISPlay:<meas>:WINDow[1]:TRACe:Y[:SCALe]:RANGe?`

Example	`:DISP:CHP:WIND:TRAC:Y:RANG 100` `:DISP:CHP:WIND:TRAC:Y:RANG?`
Couplings	Coupled to **Scale/Div** as follows **Scale Range** = **Scale/Div** * 10 (number of divisions) When you change this value, **Auto Scaling** automatically changes to `OFF`
Preset	100 dB
State Saved	Saved in instrument state
Min	1
Max	200

Y Axis Unit

Displays a dropdown menu that enables you to change the vertical (Y) axis amplitude unit. This setting affects how the data is read over the remote interface. When using the remote interface, only numerical values are returned, so you must know what the Y Axis Unit is to interpret the results. This is described in more detail in "Amplitude Data Query and Y Axis Unit" on page 886 below.

For measurements that support both Log and Lin scales, the instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales. For example, if Display Scale has been set to Log, and you set Y Axis Unit to dBm, pressing **Display Scale (Log)** sets the Y Axis Unit to dBm. If Display Scale has been set to Lin and you set Y Axis Unit to V, pressing **Display Scale (Lin)** sets the Y Axis Unit to V. Pressing **Display Scale (Log)** again sets the Y Axis Unit back to dBm.

If an Amplitude Correction is being applied that has an associated Transducer Unit, all selections but **Xducer Unit** are grayed-out. For more information, see "Transducer Unit" on page 887 below.

Remote Command	`:UNIT:POWer DBM | DBMV | DBMA | V | W | A | DBUV | DBUA | DBPW | DBUVM | DBUAM | DBPT | DBG` `:UNIT:POWer?`

Example	`:UNIT:POW dBmV`
	`:UNIT:POW?`
	See also "Remote Interface Examples" on page 885 below

Notes	The Y axis unit has either logarithmic or linear characteristics. The set of units that is logarithmic consists of dBm, dBmV, dBmA, dBmV, dBmA, dBmV/m, dBmA/m, dBpT, and dBG. The set of units that are linear consists of V, W, and A. The chosen unit will determine how the reference level and all the amplitude-related outputs like trace data, marker data, etc., read out
Dependencies	Appears only in Spectrum Analyzer Mode If an amplitude correction with a Transducer Unit other than None is applied and enabled: – The Transducer Unit selection is forced, and is the only Y Axis Unit available. The specific Transducer Unit is shown in square brackets in the dropdown, and all other Y Axis Unit choices are grayed-out – If you turn off that correction or set Apply Corrections to NO, the Y Axis Unit that existed before the Transducer Unit was applied is restored When Normalize is ON (in the **Trace**, **Normalize** menu), Y Axis Unit is grayed-out, and forced to dBm
Couplings	The instrument retains the entered Y Axis Unit separately for both Log and Lin amplitude Display Scales
Preset	dBm for log scale, V for linear. The true 'preset' value is dBm, since at preset the Y Display Scale is set to logarithmic
State Saved	Saved in instrument state
Annotation	The Y Axis Unit is shown after Ref Level value at the top of the graticule

Unit	Example	Notes
dBm	`:UNIT:POW DBM`	Y Axis Unit is set to dBm
dBmV	`:UNIT:POW DBMV`	Y Axis Unit is set to dBmV
dBmA	`:UNIT:POW DBMA`	Y Axis Unit is set to dBmA
W	`:UNIT:POW W`	Y Axis Unit is set to W

Unit	Example	Notes
V	:UNIT:POW V	Y Axis Unit is set to V
A	:UNIT:POW A	Y Axis Unit is set to A
dBmV	:UNIT:POW DBUV	Y Axis Unit is set to dBmV
dBmA	:UNIT:POW DBUA	Y Axis Unit is dBmA. The unit dBuA can also appear as a Transducer Unit
dBpW	:UNIT:POW DBPW	Y Axis Unit is set to dBpW

Remote Interface Examples

Command examples and details appear in the table below. Note that each of the commands below sets the amplitude unit only for the *selected* amplitude scale (Log or Lin), the other scale is unaffected.

Unit	Example	Notes
dBm	:UNIT:POW DBM	dB relative to one milliwatt
dBmV	:UNIT:POW DBMV	dB relative to one millivolt
dBmA	:UNIT:POW DBMA	dB relative to one milliamp
W	:UNIT:POW W	Watts
V	:UNIT:POW V	Volts
A	:UNIT:POW A	Amperes
dBmV	:UNIT:POW DBUV	dB relative to one microvolt
dBmA	:UNIT:POW DBUA	dB relative to one microamp The unit dBuA can also appear as a "Transducer Unit" on page 887 When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA transducer unit. If :CORR:CSET:ANT? returns NOC (for No Conversion), you are using a normal Y Axis dBuA. If it returns UA, you are using a Transducer Unit dBuA
dBpW	:UNIT:POW DBPW	dB relative to one picowatt
dBmV/m (Transducer Unit)	:UNIT:POW DBUVM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmV/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 887
dBmA/m (Transducer Unit)	:UNIT:POW DBUAM	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA/meter. This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 887

Unit	Example	Notes
dBpT (Transducer Unit)	`:UNIT:POW DBPT`	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBpT (dB relative to one picotesla). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 887
dBG (Transducer Unit)	`:UNIT:POW DBG`	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBG (dB relative to one Gauss). This selection is only available if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 887
dBmA (Transducer Unit)	`:UNIT:POW DBUA`	Sets the amplitude unit for the selected amplitude scale (log/lin) to dBmA. This selection is only available as a Transducer Unit if a Correction is turned on, and the Transducer Unit for that Correction is not None See "Transducer Unit" on page 887 The unit dBuA can also appear as a normal Y Axis Unit (see above) dBuA as a Transducer Unit is used when using current probes, because current probes are often supplied with conversion tables that provide the transducer factors. When dBuA is used as a Transducer Unit, the normal conversion from power to amps for dBuA (based on the instrument input impedance) is not done, but instead the conversion is based solely on the Correction that contains the transducer factors. This is what distinguishes dBuA as a normal unit from dBuA as a transducer unit When querying the Y-Axis unit, you can query the Transducer Unit to distinguish between regular dBuA and the dBuA Transducer Unit. If `:CORR:CSET:ANT?` returns `NOC` (for No Conversion), you are using a normal Y-Axis dBuA. If it returns `UA`, you are using a Transducer Unit dBuA

Amplitude Data Query and Y Axis Unit

The settings of Y-Axis Unit and Display Scale affect how the data is returned over the remote interface in response to a query. When using the remote interface, no unit is returned, so you must know what the Y-Axis unit is to interpret the results:

Example 1

Set the following:

- Display Scale (Log)
- Y Axis Unit, dBm
- Scale/Div, 1 dB
- Ref Level, 10 dBm

This sets the top line to 10 dBm with each vertical division representing 1 dB. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 5 dBm and will read out remotely as 5.

Example 2

Set the following:

- Display Scale (Lin)
- Y Axis Unit, Volts
- Ref Level, 100 mV (10 mV/div)

This sets the top line to 100 mV and the bottom line to 0 V, so each vertical division represents 10 mV. Thus, if a point on trace 1 is on the fifth graticule line from the top, it represents 50 mV and will read out remotely as 50.

NOTE **The units of current (A, dBmA, dBuA) are calculated based on 50 Ω input impedance.**

Transducer Unit

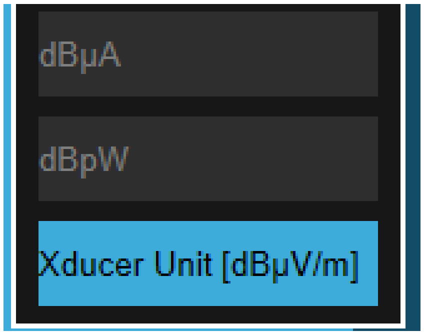
Transducer Units (formerly called Antenna Units) are units of field strength rather than amplitude, and are used when correcting the response of device such as antennas whose amplitude characteristics are measured in units of field strength. All five of the Transducer Units (dBmA/m, dBmV/m, dBG, dBpT, dBmA) are treated by the instrument exactly as though they were dBmV, when uncorrected. You must load an appropriate correction factor using Input/Output, Corrections for accurate and meaningful results.

If a remote command is sent to the instrument that uses one of the Transducer Units as a terminator, the instrument treats it as though DBUV had been sent as the terminator.

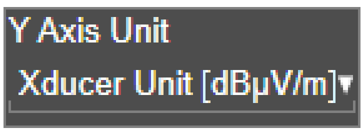
When a Correction is turned on that uses a Transducer Unit, the Y Axis Unit changes to that Transducer Unit. All of the selections in the **Y-Axis Unit** dropdown are then grayed-out, except the Transducer Unit selection. The unit being used is shown on this selection in square brackets, and appears on the control in square brackets preceded by **Xducer Unit**.

Example:

If the Transducer Unit in the Correction is dBmV/m, then the selection in the dropdown looks like this:



And on the control it looks like this:



NOTE

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output**, **Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

If a Transducer Unit is set, it is displayed as **Xducer Unit** in the **Y Axis Unit** dropdown. However, you can only *change* the Transducer Unit via the **Edit Correction** dialog in the **Input/Output**, **Corrections** menu. In that dialog, tap **Settings** then **Transducer Unit**. You can also turn off Transducer Unit from the same menu, by selecting **None**.

The Transducer Units are:

Units	Example
dBmV/m	`:UNIT:POW DBUVM`
dBmA/m	`:UNIT:POW DBUAM`
dBpT	`:UNIT:POW DBPT`
dBG	`:UNIT:POW DBG`
dBmA	`:UNIT:POW DBUA`
None	n/a

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off switch turns **Ref Level Offset** on and off. Setting a value for Ref Level Offset turns **Ref Level Offset**ON.

For more on using offsets, see the Ref Level Offset control description for the Swept SA measurement.

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet <rel_ampl>` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet?`

Example	Set **Ref Level Offset** to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB will be assumed:
	`:DISP:WIND:TRAC:Y:RLEV:OFFS 12.7`
	`:DISP:WIND:TRAC:Y:RLEV:OFFS?`

Dependencies	Appears only in SA Mode
Preset	0 dBm
State Saved	Saved in instrument state
Min	The range for **Ref Level Offset** is variable. It is limited to values that keep the reference level within the range of -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as "Ref Lvl Offset <value>" above the reference value annotation if nonzero. When the offset is zero, no annotation is shown

Auto Function

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF | ON | 0 | 1` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?`
Example	Turn on **Ref Level Offset**: `:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON`
Preset	OFF

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?`
Example	`:DISP:ACP:WIND:TRAC:Y:RPOS CENT` `:DISP:ACP:WIND:TRAC:Y:RPOS?`
Preset	TOP
State Saved	Saved in instrument state
Range	TOP|CENTer|BOTTom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position

Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition`

Auto Scaling

Toggles **Auto Scaling** On or Off.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle?`
Example	`:DISP:ACP:WIND:TRAC:Y:COUP OFF` `:DISP:ACP:WIND:TRAC:Y:COUP?`
Couplings	When **Auto Scaling** is ON, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you change a value of "Scale/Div" on page 882, "Ref Value" on page 882, or "Scale Range" on page 1538, **Auto Scaling** automatically changes to OFF
Preset	1
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle`

3.5.8.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 891
- See "Single-Attenuator Configuration" on page 891

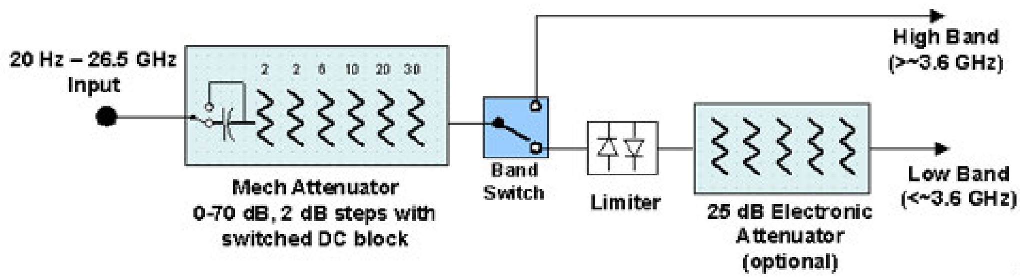
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9421A/10A/11A, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

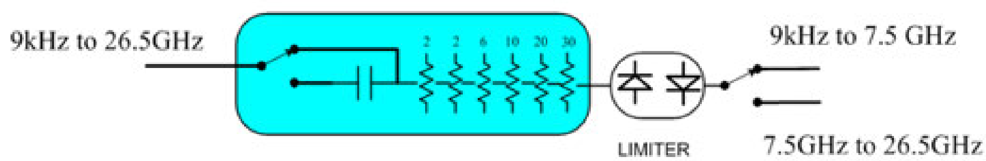
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

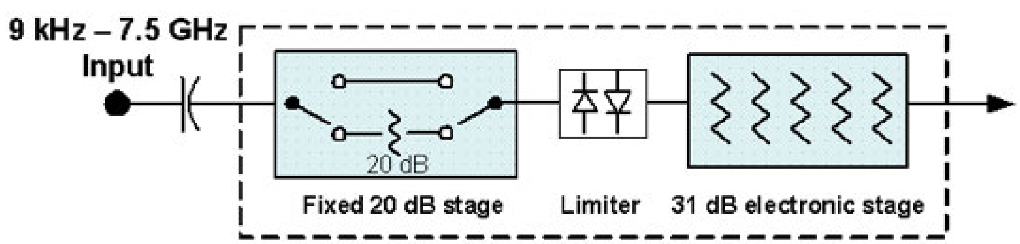


Configuration 2: Mechanical attenuator, no optional electronic attenuator



Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the

Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator **Single Attenuator**

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 1935 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB

Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows: – If the sweep is entirely < 50 GHz, the value shown after "Atten:" is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after "Atten:" is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after "Atten:" is preceded by the symbol ">=" and is equal to Full Range Atten In the **Amplitude**, "Y Scale" on page 1929 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows: "Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 895

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20` Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation) In either case, if the attenuator was in Auto, it is set to Manual

	`:POW:ATT:AUTO ON` Turn Auto Mech Atten `ON`
Dependencies	Some measurements do not support Auto setting of "Mech Atten" on page 893. In these measurements, the **Auto/Man** selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1937 See "Attenuator Configurations and Auto/Man" on page 895 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 893 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting will be changed to a multiple of 10 dB which will be no smaller than the previous setting. For example, 4 dB attenuation will be changed to 10 dB
Preset	The preset for Mech Attenuation is “Auto” The Auto value of attenuation is 10 dB `ON`
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB

	All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: A: 24 dB (e14) Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

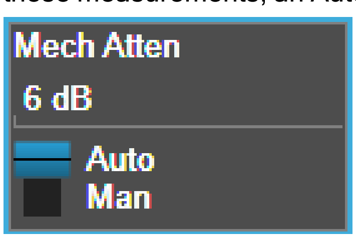
Attenuator Configurations and Auto/Man

As described under "Y Scale" on page 1929, there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 893 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation.

See "Elec Atten" on page 1937 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details about the Electronic Attenuator, see "More Information" on page 897

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation’s specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no “electronic attenuator”; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a “soft” attenuation. The “soft” attenuation is treated as an addition to the “main” attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar

	The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed-out If "Internal Preamp" on page 1959 is ON (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 1960 is ON, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 898
Preset	0 dB OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 899 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1937

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved
- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1942.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in 5G NR Mode only

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in 5G NR Mode only
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1941 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 901

Selection	SCPI	Note
Off	`OFF`	This is the default setting
On	`ON`	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the `ON` parameter is supported and mapped to `COMBined`

Selection	SCPI	Note
Elec Atten Only	ELECtrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

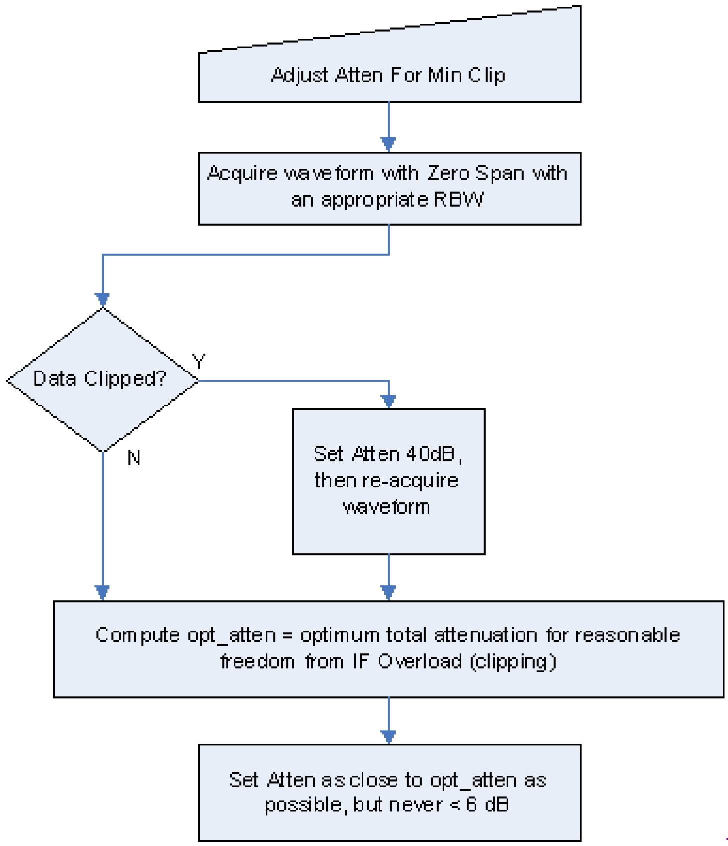
Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 1937 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 900 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, available only in 5G NR Mode
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?

Adjustment Algorithm

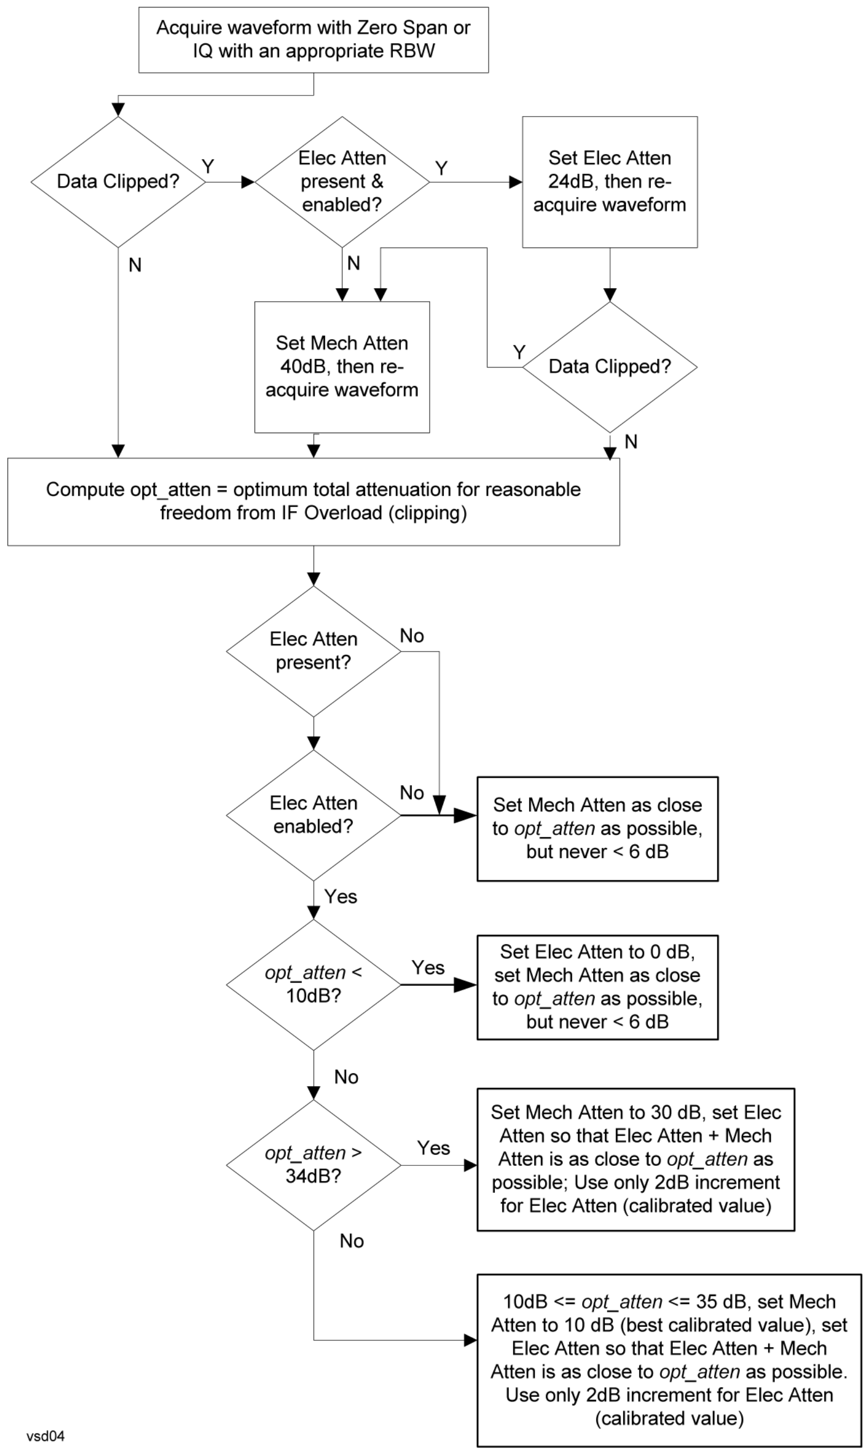
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

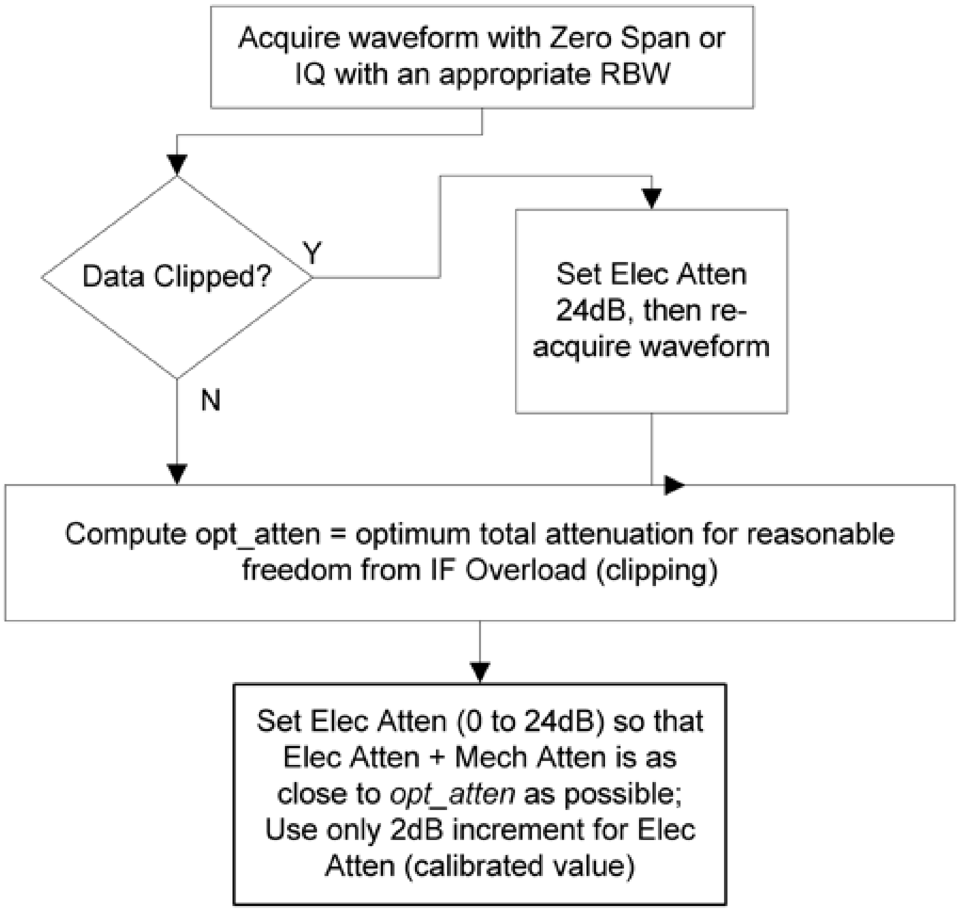
"Adjust Atten for Min Clipping" on page 1941 or "Pre-Adjust for Min Clipping" on page 900 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to opt_atten as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to opt_atten as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= opt_atten <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 900 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "Max Mixer Lvl Rules" on page 1948.

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real>` `[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?`
Example	`:POW:MIX:RANG -15 dBm` `:POW:MIX:RANG?`
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

NORMal	The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the Reference Level is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression with be negligible
TOI	Allows a range of settings of the "Max Mixer Level" on page 1947, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
COMPression	Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMal	Normal – balance TOI, noise, and compression	–10	–50	0
TOI	TOI-limited dynamic range	–25	–50	–10
COMPression	Compression-limited dynamic range	–3	–10	+30

Remote Command	[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal | TOI | COMPression [:SENSe]:POWer[:RF]:MIXer:RULEs?
Example	:POW:MIX:RULE:COMP
Dependencies	Only appears in the Swept SA and RTSA measurements
Preset	NORM

3.5.8.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

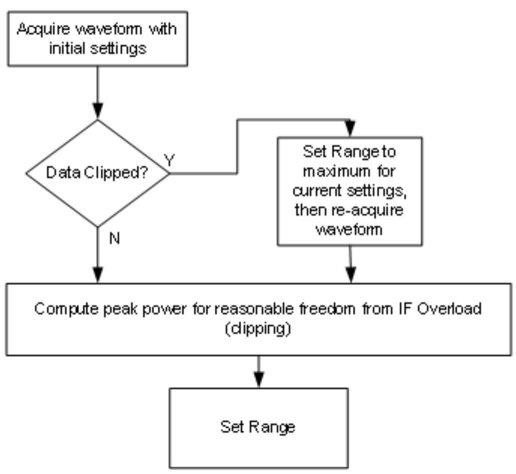
Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and ON) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	OFF for Swept SA measurement; ON for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1953 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	Does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1955. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.5.8.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9421A, or UXM.

This tab *does* appear in VXT Models M9410A/11A, because "Software Preselection" on page 1971 is under this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1958 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 911.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed

	The offset applied to do the centering appears in "Preselector Adjust" on page 1958
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find
2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated
3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 1956 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`

Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1956, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec’d below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for Low Band, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, **N/A** is displayed in the square brackets for Low Band.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL`
	`[:SENSe]:POWer[:RF]:GAIN:BAND?`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW`

	OFF
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1959. LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

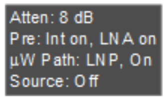
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 1959, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 914

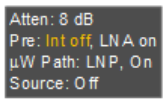
Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9421A/10A/11A May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	OFF
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the

input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	`:POW:MW:PATH STD`	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	`:POW:MW:PATH LNP`	See "Low Noise Path Enable" on page 919
µW Preselector Bypass	`:POW:MW:PATH MPB`	See "µW Preselector Bypass" on page 921
Full Bypass Enable	`:POW:MW:PATH FULL`	See "Full Bypass Enable" on page 922

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL` `[:SENSe]:POWer[:RF]:MW:PATH?`

Example	`:POW:MW:PATH LNP`
	Enables the Low Noise path
	`:POW:MW:PATH?`

Notes	If "Presel Center" on page 1956 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m, VXT Models M9410A/11A, nor in BBIQ and External Mixing – The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed – The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed – The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”

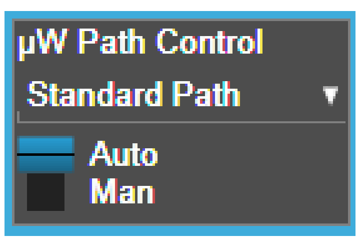
µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:



This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass

Measurement	When µW Path Control is in Auto
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when ‘Enabled Wideband IF for FFT’ is OFF or ‘Sweep Type Rule’ is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and

Measurement	When µW Path Control is in Auto
	"Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See the tables above
Preset	`ON`
Range	`ON|OFF`

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

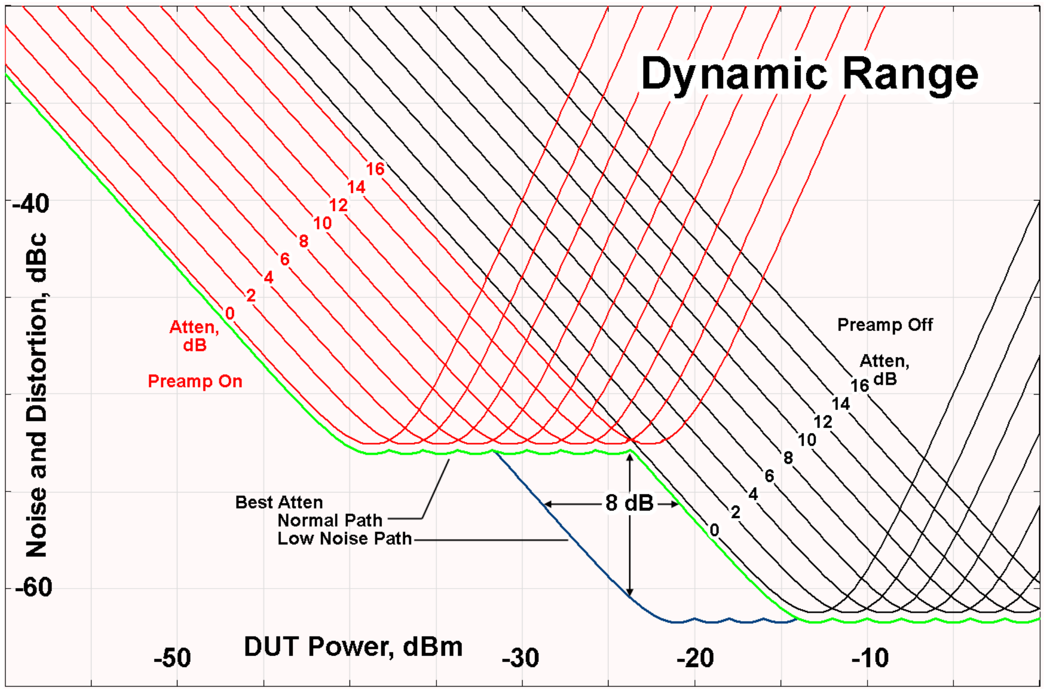
Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue

shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious

signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION When **Full Bypass Enable** is selected, and "Y Scale" on page 1929 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

"Full Bypass Enabled, maximum safe input power reduced"

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.

Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection

Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

– There is some speed cost due to the need to take multiple captures

– Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is `OFF`. The grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied

bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)

– NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is OFF. The grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when **Software Preselection** is enabled
Preset	N9041B: NORMal N9042B+V3050A: NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in SA Mode:

	`:SAN:PFIL ON`
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See "Prefilter Presets" on page 928 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.5.9 BW

Opens the **BW** menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.5.9.1 Settings

Contains the basic Bandwidth functions. In most measurements it is the only tab under Bandwidth.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of **Res BW** to "Span" on page 948. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing "Auto Couple" on page 1995 or by performing a **Preset**.

For more Mode-specific details, see: "More Information" on page 930

Remote Command	`[:SENSe]:ACPower:BANDwidth[:RESolution] <bandwidth>` `[:SENSe]:ACPower:BANDwidth[:RESolution]?`
Example	`:ACP:BAND 5 MHz` `:ACP:BAND?`
Notes	For numeric entries, all **Res BW** Types choose the nearest (arithmetically, on a linear scale, rounding up) available **Res BW** to the value entered The setting and querying of values depend on the current bandwidth type This parameter is preset by "Meas Method" on page 963. Preset values are: **Modes** / **Values**: 5GNR, LTEAFDD/TDD, MSR, VMA, SRCOMM: IBW 100 kHz, IBWR 30 kHz SA: IBW 220 kHz, IBWR 30 kHz WCDMA: IBW 100 kHz, IBWR 27 kHz, FAST 390 kHz When **Meas Method** is “Fast Power” and Fast Power RBW mode is “Best Speed,” RBW is calculated as follows: RBW = Span × 2.442 × 10^{-3}
Dependencies	Disabled when **Meas Method** is RBW, FAST, or Fast Power and Fast Power RBW mode is Best Speed If pressed, an advisory message is generated. If the equivalent SCPI command is sent, a "Setting

	conflict" warning is generated
Couplings	Sweep time is coupled to the RBW. As RBW changes, the sweep time (if set to **Auto**) is changed to maintain amplitude calibration "Video BW" on page 931 is coupled to **Res BW**. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1) When **Res BW** is set to **Auto**, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When **Res BW** is set to **Man**, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	Auto, unless noted in "RBW Presets" on page 930
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A “#” mark appears before “RBW” in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility this command accepts both the `BANDwidth` and `BWIDth` forms For ESA, the maximum Res BW was 5 MHz; for X-Series it is 8 MHz The following command is supported [:SENSe]:ACP:SWEep:BANDwidth|BWIDth[:RESolution]

Auto Function

Remote Command	`[:SENSe]:ACPower:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0` `[:SENSe]:ACPower:BANDwidth[:RESolution]:AUTO?`
Example	`:ACP:BAND:AUTO ON` `:ACP:BAND:AUTO?`
Preset	See "RBW Presets" on page 930

RBW Presets

Unless noted in the table below, the Preset value of **Res BW** is **Auto**.

Mode	Preset Value
WCDMA	100 kHz
MSR	100 kHz
SA	220 kHz
5GNR	100 kHz

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on "RBW Filter Type" on page 933.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on the **RBW Filter Type** or the **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

In some PowerSuite measurements, in the LTE-Advanced (both FDD and TDD) Modes, when **Res BW** is **Auto**, the resolution bandwidth is predefined based on the corresponding bandwidth of the single LTE carrier, as shown in the table below. In the Multi-carrier case, the narrowest **Res BW** among the active carriers is used.

LTEAFDD, LTEATDD Modes

Carrier BW	Auto Res BW, kHz
1.4 MHz	51
3 MHz	51
5 MHz	100
10 MHz	100
15 MHz	100
20 MHz	100
200 kHz (NB-IoT in FDD)	10

5G NR Mode

100 kHz for all carrier bandwidths.

Video BW

Lets you change the instrument post-detection filter (VBW or “video bandwidth”) from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to "Res BW" on page 929. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Video BW** control. This may also be done by pressing "Auto Couple" on page 1995 or by performing a **Preset**.

For more information, see "VBW Presets" on page 932

Remote Command	`[:SENSe]:ACPower:BANDwidth:VIDeo <bandwidth>`
	`[:SENSe]:ACPower:BANDwidth:VIDeo?`
	`[:SENSe]:ACPower:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:ACPower:BANDwidth:VIDeo:AUTO?`

Example	`:ACP:BAND:VID 2.4 MHz`
	`:ACP:BAND:VID?`
	`:ACP:BAND:VID:AUTO ON`
	`:ACP:BAND:VID:AUTO?`

Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after **Mode Preset**
Dependencies	Sometimes the displayed **Video BW** is not actually used to process the trace data: – When the Average Detector is selected and **Sweep Type** is set to **Swept**, the video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector – When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, the VBW still acts to change the sweep time, if **Sweep Time** is in **Auto**, and still affects the data on other traces for which this is not the case Disabled when **Meas Method** is RBW, FAST, or Fast Power If pressed, an advisory message is generated. If the equivalent command is sent, a "Setting conflict" warning is generated
Couplings	Video bandwidth (VBW) is normally coupled to RBW. If **VBW** is set to Auto, then the VBW is changed as the RBW changes, to maintain the ratio (usually 10:1)
Preset	See "VBW Presets" on page 932 below
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A “#” mark appears before “VBW” in the annotation when it is not coupled
Annotation	In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility this command accepts both the `BANDwidth` and `BWIDth` forms

VBW Presets

Unless noted in the table below, the Preset value of **Video BW** is **Auto**.

Mode	Preset Value
WCDMA	1 MHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the Res BW filters in HP/Agilent/Keysight spectrum analyzers were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its –3 dB points 10 MHz apart. In X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI Example
Gaussian	:BAND:SHAP GAUS
Flattop	:BAND:SHAP FLAT

Remote Command	`[:SENSe]:ACPower:BANDwidth:SHAPe GAUSsian | FLATtop` `[:SENSe]:ACPower:BANDwidth:SHAPe?`
Example	`:ACP:BAND:SHAP GAUS` `:ACP:BAND:SHAP?`
Notes	`GAUSsian`= Gaussian `FLATtop` = Flattop
Dependencies	Disabled when "Meas Method" on page 963 is FAST or Fast Power If pressed, an advisory message is generated. If the equivalent command is sent, a "Setting conflict" warning is generated
Preset	"Auto Couple" on page 1995 selects the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used
Backwards Compatibility SCPI	`[:SENSe]:ACPower:BWIDth:SHAPe`

RBW Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:BANDwidth:TYPE DB3 | DB6` `[:SENSe]:ACPower:BANDwidth:TYPE?`
Example	`:ACP:BAND:TYPE DB3` `:ACP:BAND:TYPE?`
Dependencies	Disabled when "RBW Filter Type" on page 933 is `FLATtop` or "Meas Method" on page 963 is RBW, FAST, or Fast Power

	If pressed, an advisory message is generated. If the equivalent command is sent, a "Setting conflict" warning is generated
Preset	DB3
State Saved	Saved in instrument state
Range	–3 dB (Normal)|–6 dB
Backwards Compatibility SCPI	[:SENSe]:ACPower:BWIDth:TYPE

3.5.10 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.5.10.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Bar Graph On/Off

Turns the Bar Graph On or Off.

Remote Command	:DISPlay:ACPower:WINDow[1]:BGRaph OFF | ON | 0 | 1 :DISPlay:ACPower:WINDow[1]:BGRaph?
Example	:DISP:ACP:WIND:BGR OFF :DISP:ACP:WIND:BGR?
Dependencies	Always set to ON and grayed-out when the method is RBW
Preset	ON
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:ACPower:VIEW[1]:WINDow[1]:BGRaph

3.5.10.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ....

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Frequency Annotation

Turns on and off the absolute frequency annotation in the main display for all windows in all measurements in the current Mode for which Frequency Annotation on/off is supported.

The affected annotations include Center Frequency, Start/Stop Frequency, Frequency Offset, Marker Frequency. Any relative frequency annotation such as Span and Marker Delta are not affected.

The frequency annotations in any other associated display, such as in Active Function, Softkey label, Limit Editor, Amp Corr Editor and Marker Table are not changed.

Frequency annotations that are not associated with the spectrum, such as RBW, IBW, Sweep Time, are excluded and they are shown regardless of this selection.

Remote Command	`:DISPlay:ANNotation:FREQuency[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:FREQuency[:STATe]?`
Example	`:DISP:ANN:FREQ OFF`
Dependencies	Only appears in the Swept SA measurement in Spectrum Analyzer Mode
Preset	`ON`

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

– and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither

*RST nor :SYSTem:PRESet enable the display)

– and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending :SYSTem:DEFaults MISC or :DISPlay:ENABle ON (neither *RST nor :SYSTem:PRESet enable the display)

– and you are using either the :SYSTem:KLOCk command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is OFF, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SELect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SELect
Delete Screen	:INSTrument:SCReen:DELete
Delete All But This Screen	:INSTrument:SCReen:DELete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	:DISPlay:ENABle OFF | ON | 0 | 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does *not* change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.5.10.3 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 876.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME “Baseband”` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; User View SCPI cannot be used while Display is disabled” is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View’s name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN “Baseband”`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message “-224, Illegal parameter value; View <alphanumeric> already exists” is generated If the current View is a Predefined View, the error message “-224, Illegal parameter value; Cannot

	rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1983), then query the list of available Views, the result is undefined

3.5.11 Frequency

Contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the **Center Frequency** setting is the same for all measurements - it does not change as you change measurements.

3.5.11.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The **Center Frequency** setting is the same for all measurements within a mode, that is, it is Meas Global. Some Modes are also able to share a Mode Global center frequency value. If this is the case, the Mode has a **Global** tab in its **Meas Setup** menu.

Center Frequency sets (and queries) the center frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, **Center Frequency** changes to the value for that input. SCPI commands are available to directly set **Center Frequency** for a specific input.

Center Frequency is remembered as you go from input to input. Thus, you can set a **Center Frequency** of 10 GHz with the RF Input selected, change to BBIQ and set a **Center Frequency** of 20 MHz, then switch to External Mixing and set a **Center Frequency** of 60 GHz. When you go back to the RF Input, **Center Frequency** returns to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

– "RF Center Freq" on page 946

– "Ext Mix Center Freq" on page 947

– "I/Q Center Freq" on page 948

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	Set Center Frequency to 50 MHz:
	`:FREQ:CENT 50 MHz`
	Increment the Center Frequency by the value of CF Step:
	`:FREQ:CENT UP`
	Return the current value of Center Frequency:
	`:FREQ:CENT?`

Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input

	– For RF input it is equivalent to `:FREQ:RF:CENT` – For I/Q input it is equivalent to `:FREQ:IQ:CENT` – For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values are dependent on Hardware Options (5xx) If no terminator (e.g., MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Dependencies	Not available in the MSR, LTEAFDD, LTEATDD and 5G NR modes
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 944, "RF Center Freq" on page 946, "Ext Mix Center Freq" on page 947, "I/Q Center Freq" on page 948 and "VXT Models with Radio Heads/CIU Frequency Range" on page 946
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 944, "RF Center Freq" on page 946, "I/Q Center Freq" on page 948 and "VXT Models with Radio Heads/CIU Frequency Range" on page 946
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9421A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9421A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Specifies the RF Center Frequency. Sets the center frequency to use when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Frequency** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning

Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See "Center Frequency Presets" on page 944 above. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on the value of **Span**

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. Sets the center frequency to use when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Frequency** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Couplings	When returning to External Mixing after having switched to one of the other inputs (for example, RF), you return to the settings that you had when you left External Mixing. So, you return to the band you were in with the **Center Frequency** that you had. However, **Span** is not an input-dependent parameter, so the instrument retains the span from the previous input, limited as necessary by the current mixer setup
Preset	When a **Mode Preset** is performed while in External Mixing, the start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. **Center Frequency** thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited **Span** available to it, and cannot achieve the span shown in the table (**Span** = Stop Freq – Start Freq), then the instrument uses the maximum Span the measurement allows, and still sets **Center Frequency** to the midpoint of the start and stop freq values in the Harmonic Table When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after **Restore Input/Output Defaults**, if you go to External Mixing and do a **Mode Preset** while in Spectrum Analyzer Mode, the resulting **Center Frequency** is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on **Span**
Max	The maximum frequency in the currently selected mixer band – 5 Hz If the knob or step keys are being used, also depends on **Span**

I/Q Center Freq

Specifies the I/Q Center Frequency. Sets the center frequency to use when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that the **Center Frequency** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each Mode and common across all the measurements in the Mode
Preset	0 Hz
State Saved	Saved in instrument state
Min/Max	–/+40.049995 MHz

Span

Changes the displayed frequency range symmetrically about **Center Frequency**. While adjusting **Span**, **Center Frequency** is held constant, which means that both start and stop frequencies will change.

If **Span** is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.The default (and minimum) **Span** is calculated using the number of carriers and the carrier width where;

Span = (Upper Carrier Freq + (max offset IBW * (1 + alpha)) / 2) – (Lower Carrier Freq – (max offset IBW * (1 + alpha)) / 2)

Span is increased by a factor of 1 + Filter Alpha if the RRC Filter in on.

Remote Command	`[:SENSe]:ACPower:FREQuency:SPAN <freq>` `[:SENSe]:ACPower:FREQuency:SPAN?`
Example	`:ACP:FREQ:SPAN 10 MHz` `:ACP:FREQ:SPAN?`
Notes	In Bluetooth Mode, the value of **Span** has to be an odd MHz
Dependencies	If the electrical attenuator is enabled, any attempt to set **Span** such that the Stop Frequency would be >3.6 GHz results in an error In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in **Continuous** sweep, as there is a mechanical switch that bypasses the RF Preselector above 3.6 GHz
Couplings	**Span** affects RBW, sweeptime, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings)

	– Any value of **Center Frequency** or **Span** that is within the frequency range of the instrument is allowed *when* the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed, to keep the start and stop frequencies within the instrument's frequency range – When using the knob or the step up/down keys or the UP |DOWN keywords in SCPI, the value that is being changed, that is, **Center Frequency** or **Span**, is limited so that the other parameter is not forced to a new value – In Bluetooth Mode, if **Meas Method** is FFT, the max value of **Span** is coupled to the MAX IFBW of the platform The **Span** value is clipped when the carrier settings and/or the offset settings are changed. The value is changed to satisfy following formula: **Span** = (Upper Carrier Freq + (max offset IBW * (1 + alpha)) / 2) - (Lower Carrier Freq - (max offset IBW * (1 + alpha)) / 2) This parameter is unavailable when **Meas Method** is Fast Power. In that case, the span is fixed by the formula above
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Span Presets" on page 949
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input. See "Span Presets" on page 949
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	44.5 GHz
550	52 GHz

Freq Option	Max Span (can't set higher than this)
F06 & EP6 (VXT models M9410A/11A)	6.27 GHz
F06 & LFE & EP6 (VXT models M9411A)	6.5999935 GHz
M9415A-F06	6.27 GHz
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Preset Value
SA	8 MHz
WCDMA	24.6848 MHz
LTE, LTETDD, LTEAFDD, LTEATDD, MSR	25 MHz
5G NR	500 MHz
Radio Test	175 kHz

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the **CF Step** value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>` `[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`
Example	Increase the current center frequency value by 500 MHz: `:FREQ:CENT:STEP 500 MHz`

	`:FREQ:CENT UP`
Notes	Preset and Max values depend on Hardware Options
Dependencies	If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning Not available in MSR, LTEAFDD, LTEATDD and 5G NR Modes
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto
State Saved	Saved in instrument state
Min/Max	– /+(the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Auto Function

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1` `[:SENSe]:FREQuency:CENTer:STEP:AUTO?`
Example	`:FREQ:CENT:STEP:AUTO ON` `:FREQ:CENT:STEP:AUTO?`
Preset	`ON`

Freq Offset

Lets you set a frequency offset value to account for frequency conversions outside of the instrument. This value is added to the display readout of the marker frequency, center frequency, start frequency, stop frequency, and all other absolute frequency settings in the instrument including frequency count. When a frequency offset is entered, the value appears below the center of the graticule. To eliminate an offset, perform a **Mode Preset**, or set the frequency offset to 0 Hz.

See "More Information" on page 952

Remote Command	`[:SENSe]:FREQuency:OFFSet <freq>` `[:SENSe]:FREQuency:OFFSet?`
Example	`:FREQ:OFFS 10 MHz` `:FREQ:OFFS?`
Notes	Preset and Max values depend on Hardware Option
Dependencies	Appears only in SA Mode **Freq Offset** is not available in External Mixing. In this case the **Freq Offset** control is grayed out and shows a value of zero. However, the value of CF Offset that was set for the RF Input is retained and

	restored when you switch back to the RF Input
Preset	See "Center Frequency Presets" on page 944
State Saved	Saved in instrument state
Min	-500 GHz
Max	500 GHz
Annotation	If **Freq Offset** is not zero, "Freq Offset <value>" appears on the upper line of the annotation, below the graticule, in the center
Status Bits/OPC dependencies	Non-overlapped
Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:X[:SCALe]:OFFSet` This version of the command is in the instrument for compatibility across platforms and is not recommended for new development

More Information

This command does not affect any bandwidths or the settings of relative frequency parameters such as delta markers or span. It does not affect the current hardware settings of the instrument, but only the displayed frequency values. Entering an offset does not affect the trace position or display, just the value of the start and stop frequency and the values represented by the trace data. The frequency values of exported trace data, queried trace data, markers, trace data used in calculations such as N dB points, trace math, etc., are all affected by Freq Offset. Changing the offset, even on a trace that is not updating will immediately change all of the above, without taking new data.

NOTE If a trace is exported with a nonzero **Freq Offset**, the exported data contains the trace data with the offset applied. Therefore, if that trace were to be imported back into the instrument, you would want **Freq Offset** to be 0, or the offset would be applied again to data that is already offset. No such care need be taken when saving a State+Trace file, because the data and state are saved together.

3.5.12 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to `POSition` (Normal) and places it at the center of the display. If the selected marker is `OFF`, it is set to `POSition` and placed at the center of the screen on the trace determined by the **Marker Trace** rules.

Note that this hard key and all sub keys are unavailable when "Meas Method" on page 963 is RBW.

3.5.12.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

On any menu tab in which **Select Marker** appears, the first control is always **Marker Frequency | Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal, Delta** and **Fixed** markers

3.5.12.2 Settings

The controls on this tab include the **Marker** active function and a radio button selection of the marker control mode (`POSition`, `DELTa`, or `OFF`) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. Has no effect if the control mode is `OFF`, but is the SCPI equivalent of entering an X value if the control mode is `POSition` or `DELTa`.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:X <freq>` `:CALCulate:ACPower:MARKer[1]|2|…|12:X?`
Example	`:CALC:ACP:MARK3:X 0` `:CALC:ACP:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X-Axis Scale. If a suffix is sent that does not match the current marker X-Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is `POSition`, or the offset from the marker’s reference marker if the control mode is `DELTa`. The query is returned in the fundamental units for the current marker X-Axis scale: Hz for **Frequency and Inverse Time**, seconds for **Period and Time**
Dependencies	Unavailable when "Meas Method" on page 963 is `RBW`

Preset	After a preset, all markers are turned OFF, so Marker X-Axis Value query returns Not A Number (NAN)
State Saved	Saved in instrument state
Min/Max	–/+9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is OFF, but is the SCPI equivalent of entering a value if the control mode is POSition or DELTa, except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:X:POSition <real>` `:CALCulate:ACPower:MARKer[1]|2|…|12:X:POSition?`
Example	`:CALC:ACP:MARK10:X:POS 0` `:CALC:ACP:MARK10:X:POS?`
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is POSition, or the offset from the marker's reference marker in trace points if the control mode is DELTa. The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points. When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is OFF, the response is Not A Number
Dependencies	Unavailable when **Meas Method** is RBW
Preset	After a preset, all markers are turned OFF, so Marker X-Axis Value query returns a Not A Number (NAN)
State Saved	Saved in instrument state
Min/Max	–/+9.9E+37

Marker Y Axis Value (Remote Query only)

Returns the marker Y-Axis value in the current marker Y-Axis unit.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:Y?`
Example	`:CALC:ACP:MARK11:Y?`
Notes	Returns the marker Y-axis result, if the control mode is POSition or DELTa. If the marker is OFF, the response is Not A Number
Dependencies	Unavailable when "Meas Method" on page 963 is RBW
Preset	Depends on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:ACPower:MARKer[1]|2|…|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to POSition (**Normal**), DELTa, or OFF. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is OFF, pressing **Marker** sets it to POSition, and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is OFF, there is no active function, and the active function is turned off.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MODE POSition | DELTa | OFF` `:CALCulate:ACPower:MARKer[1]|2|…|12:MODE?`
Example	`:CALC:ACP:MARK3:MODE POS` `:CALC:ACP:MARK3:MODE?`
Dependencies	Unavailable when **Meas Method** is RBW
Preset	OFF
State Saved	Saved in instrument state
Range	POSition|DELTa|OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Backwards Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is OFF to ON (1) puts it in POSition mode and places it at the center of the screen.

Example	`:CALC:ACP:MARK2:STAT ON` `:CALC:ACP:MARK2:STAT?`
Preset	OFF
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	`:CALCulate:ACPower:MARKer[1]|2|…|12:STATe OFF | ON | 0 | 1` `:CALCulate:ACPower:MARKer[1]|2|…|12:STATe?`

Delta Marker (Reset Delta)

Pressing this button has exactly the same effect as pressing `DELTa` in **Marker Mode**. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:ACPower:MARKer:AOFF`
Example	`:CALC:ACP:MARK:AOFF`
Dependencies	Unavailable when "Meas Method" on page 963 is `RBW`

Couple Markers

When this function is `ON`, moving any marker causes an equal X-Axis movement of every other marker that is not `OFF`. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental X-Axis units of the trace that marker is on), and the X-Axis value of the marker being moved (in the same fundamental X-Axis units).

This may result in markers going off screen.

Remote Command	`:CALCulate:ACPower:MARKer:COUPle[:STATe] ON | OFF | 1 | 0` `:CALCulate:ACPower:MARKer:COUPle[:STATe]?`
Example	`:CALC:ACP:MARK:COUP ON` `:CALC:ACP:MARK:COUP?`
Dependencies	Unavailable when "Meas Method" on page 963 is `RBW`
Preset	`OFF` Presets on **Mode Preset** and **All Markers Off**
State Saved	Saved in instrument state

3.5.12.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the Peak Search page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 953on the **Settings** tab.

Peak Search

Pressing the **Peak Search** control moves the selected marker to the trace point which has the maximum Y-Axis value for that marker's trace.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

Remote Command	:CALCulate:ACPower:MARKer[1]|2|…|12:MAXimum
Example	:CALC:ACP:MARK2:MAX :SYST:ERR? can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search
Notes	Sending this command selects the subopcoded marker

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value.

If the selected marker was `OFF`, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MAXimum:NEXT`
Example	`:CALC:ACP:MARK2:MAX:NEXT`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Right

Moves the selected marker to the nearest peak right of the current marker.

If the selected marker was `OFF`, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MAXimum:RIGHt`
Example	`:CALC:ACP:MARK2:MAX:RIGH`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Left

Moves the selected marker to the nearest peak left of the current marker.

If the selected marker was `OFF`, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MAXimum:LEFT`
Example	`:CALC:ACP:MARK2:MAX:LEFT`
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum Y-Axis value on the current trace.

If the selected marker is `OFF`, it is turned on before the minimum search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:MINimum`
Example	`:CALC:ACP:MARK:MIN`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency (or time, if in zero span) differences between the highest and lowest Y-Axis value. It places the selected marker on the minimum value on its selected trace, and places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to `POSition` if it is not already on. (These markers may be on two different traces.)

If the selected marker is `OFF`, a delta type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a delta marker, then it is changed to delta, which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:PTPeak`
Example	`:CALC:ACP:MARK:PTP`
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Dependencies	**Pk-Pk Search** is not available when **Coupled Markers** is on
Couplings	The selected marker becomes a delta marker if not already in delta mode
State Saved	Not part of saved state

Marker Delta

Pressing this button has exactly the same effect as pressing `DELTa` in **Marker Mode** on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

3.5.12.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "Marker Frequency" on page 953 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:REFerence <integer>` `:CALCulate:ACPower:MARKer[1]|2|…|12:REFerence?`
Example	`:CALC:ACP:MARK2:REF 6` `:CALC:ACP:MARK2:REF?`
Notes	Causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” When queried a single value is returned (the specified marker numbers relative marker)
Dependencies	Unavailable when "Meas Method" on page 963 is `RBW`
Couplings	The act of specifying the selected marker’s reference marker makes the selected marker a **Delta** marker If the reference marker is `OFF`, it is turned on in `POSition` mode at the delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then its default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults**. This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by **Marker Off** and hence not affected by **Preset** or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal markers.

Specifying a **Marker Trace** manually or with this command associates the marker with the specified trace. If the marker is not `OFF`, it moves the marker from the trace it was on to the new trace. If the marker is `OFF`, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|…|12:TRACe 1 | 2 | 3` `:CALCulate:ACPower:MARKer[1]|2|…|12:TRACe?`
Example	`:CALC:ACP:MARK2:TRAC 2` `:CALC:ACP:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by "Auto Couple" on page 1995 Sending the remote command causes the addressed marker to become selected
Preset	1
State Saved	Saved in instrument state
Min	1
Max	3

Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility. It is the same as "Marker Settings Diagram" on page 956 on the **Settings** tab.

3.5.13 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.5.13.1 Settings

Contains frequently-used functions to which you will want the fastest access.

Avg | Hold Number

Specifies the number of measurement averages used to calculate the measurement result. The average will be displayed at the end of each sweep. After the specified number of average counts, the average mode (termination control) setting determines the average action.

Remote Command	`[:SENSe]:ACPower:AVERage:COUNt <integer>` `[:SENSe]:ACPower:AVERage:COUNt?`
Example	`:ACP:AVER:COUN 250` `:ACP:AVER:COUN?`
Notes	The BAF backwards Compatibility SCPI command, `[:SENSe]:ACPR:AVERage[:STATe]`, is provided to support same functionality as `[:SENSe]:ACPr:AVERage[:STATe]` (PSA W-CDMA, PSA cdma2000 and PSA 1xEVDO) due to ACPr node conflicts with ACPower node
Preset	10
State Saved	Saved in instrument state
Min/Max	1/1000
Annotation	Avg Number is displayed in the Measurement Bar

Backwards Compatibility SCPI	`[:SENSe]:ACPR:AVERage:COUNt`
	`[:SENSe]:MCPower:AVERage:COUNt`
	Power Suite, W-CDMA

Averaging On/Off

Turns averaging on or off.

NOTE In this measurement, the **Average Type** is preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:ACPower:AVERage[:STATe] OFF | ON | 0 | 1` `[:SENSe]:ACPower:AVERage[:STATe]?`
Example	`:ACP:AVER OFF` `:ACP:AVER?`
Preset	`ON`
State Saved	Yes
Range	`OFF|ON`

Backwards Compatibility SCPI	`[:SENSe]:ACPR:AVERage[:STATe]`
	`[:SENSe]:MCPower:AVERage[:STATe]`
	Power Suite, W-CDMA

Avg Mode

Sets the Averaging Mode. This determines the averaging action after the specified number of data acquisitions (average count) is reached.

– When set to `EXPonential`, the measurement averaging continues using the specified number of averages to compute each averaged value. The average will be displayed at the end of each sweep

– When set to `REPeat`, the measurement resets the average counter each time the specified number of averages is reached

Remote Command	`[:SENSe]:ACPower:AVERage:TCONtrol EXPonential | REPeat` `[:SENSe]:ACPower:AVERage:TCONtrol?`
Example	`:ACP:AVER:TCON EXP` `:ACP:AVER:TCON?`
Notes	The backwards-compatibility SCPI command, `[:SENSe]:ACPR:AVERage:TCONtrol`, is provided to support same functionality as `[:SENSe]:ACPr:AVERage:TCONtrol` (PSA W-CDMA, PSA cdma2000 and PSA 1xEVDO) due to `ACPr` node conflicts with `ACPower` node
Preset	`EXPonential`
State Saved	Saved in instrument state
Range	`EXPonential|REPeat`

Backwards Compatibility SCPI	`[:SENSe]:ACPR:AVERage:TCONtrol`
	Power Suite, W-CDMA:
	`[:SENSe]:MCPower:AVERage:TCONtrol`

Meas Method

Sets the desired method to measure ACP. The options are:

Integration BW `IBW`	One sweep of the trace is taken, and the band power for each offset is computed. Depending on "Measurement Type" on page 1045 (Total Power Reference or PSD Reference), results are displayed relative to the total power or the power spectral density. The display reflects either the current trace or a bar graph view
Filtered IBW `IBWRange` (max dynamic range)	The ACP Path is used to compute ACP when an ACP path is available. This method increases dynamic range, but increases measurement time as it limits the resolution bandwidth. This method is useful for improving dynamic range on a W-CDMA signal because a sharp cutoff bandpass filter is used. The accuracy of the adjacent channel power ratio is not degraded by this method, but the absolute accuracy of both adjacent channel power and carrier power are degraded by up to about 0.5 dB
RBW `RBW`	The algorithm uses zero-span and an appropriate RBW setting to capture all of the power in the carrier channel and the offsets. The zero-span algorithm (RBW method) is slower than the IBW method, but greatly improves repeatability
Fast `FAST`	WCDMA Mode or SA Mode with 3GPP WCDMA radio standard selected: Provides the same method as the Integration BW method, but is optimized for speed to measure a W-CDMA signal SA Mode with CDMA2K radio standard selected: Provides faster measurement using the FFT method with a limited parameter flexibility. When this is selected, CDMA2K preset offsets are given and control of the following are unavailable:

- BW menu
- Sweep/Control menu except Pause/Resume
- Trace/Detector menu
- Carrier Setup, Offset Limit, RRC Weighting, Filter Alpha, and Noise Correction in Meas Setup menu

Fast Power
`FPOWer`
(Option FP2 required)
	This provides faster measurement using the Hardware accelerated FFT method with a limited parameter flexibility. When this is selected, the following parameters are not available:
	– Points and Auto Sweep Points under Sweep
	  – When changing Meas Method to Fast Power, Auto Sweep Points is turned on and grayed-out (Sweep Points will change according to the Fast Power setting)
	  – When returning Meas Method to any setting other than Fast Power, Auto Sweep Points stays on and becomes available (Sweep Points will change according to the auto sweep points calculation algorithm)
	– Trace Type, Restart Averaging and View/Blank under Trace when Select Trace is Trace 2 or Trace3
	– Span under Frequency
	– Res BW, Video BW, Filter Type and Filter BW of Offset > Advanced dialog of Carr/Offset/Limits Config control under Meas Setup
	– For Trigger, only Free Run, External 1 and External 2 are supported
	When in microwave frequency and measurement span is > 40MHz, RF preselector must be turned off

Remote Command	`[:SENSe]:ACPower:METHod IBW | IBWRange | FAST | RBW | FPOWer` `[:SENSe]:ACPower:METHod?`
Example	`:ACP:METH IBW` `:ACP:METH?`
Notes	`FAST` mode is only supported for WCDMA and C2K signals. You must be in WCDMA or SA Modes, with 3GPP WCDMA or CDMA2K radio standard. Otherwise, a setting conflict error message is reported MSR, LTEAFDD, LTEATDD and 5G NR Modes support only Integration BW, Filtered IBW and Fast Power methods
Dependencies	When `RBW`, `FAST` or `FPOWer` is selected, **Gate** function is not available. If you try to turn **Gate**`ON` while **Meas Method** is `RBW`, `FAST` or `FPOWer`, an error is generated When **Gate** function is `ON`, `RBW`, `FAST` and `FPOWer` are not available. If you try to change **Meas Method** to `RBW`, `FAST` or `FPOWer`, an error is generated VXT Models M9420A/10A/11A support only the Integration BW method
Couplings	IBW (Range) restricts the **Res BW** available for making this measurement to 30 kHz. When selected, **Res BW** is clipped to this value if required and an error number displayed
Preset	`IBW`
State Saved	Saved in instrument state

Range	IBW|IBWRange|FAST|RBW|FPOWer
Backwards Compatibility SCPI	[:SENSe]:ACPR:SWEep:TYPE (Power Suite, WCDMA) [:SENSe]:MCPower:METHod

Carrier/Offset/Limits Config

Opens a dialog that lets you set Carriers, Offset, and Limits parameters.

Carrier

Lets you configure your carriers, carrier spacing, noise bandwidth and measurement method.

Dependencies	Appears in all Modes except MSR, LTEAFDD, LTEATDD and 5G NR

Number of Carriers

This is the same as "Number of Carriers" on page 1005 under **Reference**.

Couple to #1

Couples carrier settings to carrier #1. The coupled parameters are:

- "Carrier Pwr Present" on page 1006
- "Carrier Spacing" on page 1007
- "Measurement Noise Bandwidth" on page 1008
- "Method for Carrier " on page 1009
- "Filter Alpha for Carrier" on page 1010

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle OFF | ON | 0 | 1, … [:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle?
Example	:ACP:CARR:LIST:COUP OFF :ACP:CARR:LIST:COUP?
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compat-

	ibility with legacy LTE FDD/TDD, the SCPI command is supported in LTE & LTE-A converged applications
Couplings	When ON, the carrier settings are coupled to carrier #1. Coupled parameters are: Carrier Power Present, Carrier Spacing, Measurement Noise Bandwidth, Method and Filter Alpha When a setting is changed, coupling is switched off automatically Carrier #1 is always set to ON and cannot be changed
Preset	ON
State Saved	Saved in instrument state

Carrier Pwr Present

Configures the carriers for this measurement. Allows spaces to be inserted between carriers. Carriers with the power present parameter set to YES are carriers, and those with the power present parameter set to NO are spaces. Each carrier power present is set to YES or NO. The individual carrier can be set by selecting the desired carrier.

The query returns the current values for all of the carriers. If a carrier is defined as having no power present, the power displayed is relative to the reference carrier, otherwise the absolute power is displayed.

If you change the carrier power present to NO, and that carrier is currently configured as the reference carrier, the next carrier to the left (or the right if there are no carriers to the left) is assigned as the reference carrier. This also applies to the scenario where there are only two carriers configured as having power present, and you configure only one carrier to have no power present.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent YES	NO, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent?`
Example	`:ACP:CARR2:LIST:PPR YES` `:ACP:CARR2:LIST:PPR?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. To maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list

Preset	YES
State Saved	Saved in instrument state
Backwards Compatibility SCPI	[:SENSe]:MCPower:CARRier[1]|2:LIST:PPResent

Carrier Spacing

Sets the width of the carrier spacing. This is the value applied to all the current slots, whether they are carriers or spaces.

Enter each carrier spacing value individually by selecting the desired carrier, and then enter the carrier width.

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh <freq>, … [:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh?
Example	:ACP:CARR2:LIST:WIDT 25kHz :ACP:CARR2:LIST:WIDT?
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. To maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list Changing Carrier Spacing might affect "Span" on page 948
Preset	SA, WCDMA, LTE, LTETDD Modes: 5 MHz Radio Test Mode: 25 kHz
State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement
Backwards Compatibility SCPI	[:SENSe]:MCPower:CARRier[1]|2:LIST:WIDTh

Measurement Noise Bandwidth

Specifies the **Measurement Noise Bandwidth** used to calculate the power in the carriers.

Each **Measurement Noise Bandwidth** value is entered individually by selecting the desired carrier. Enter the measurement noise bandwidth on the **Carrier** page of the **Carr/Offset/Limits Config** dialog.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration] <freq>, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]?`
Example	`:ACP:CARR2:LIST:BAND 25kHz` `:ACP:CARR2:LIST:BAND?`
Notes	In WCDMA Mode, the preset/default value is defined as 3.84 MHz, but internally, 4.6848 MHz is used as the default value Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list
Preset	(see table below)
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

Backwards Compatibility SCPI	`[:SENSe]:ACPower:BANDwidth:INTegration`
	`[:SENSe]:ACPower:BWIDth:INTegration`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]`
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

Preset:

Modes	Value
SA	2 MHz
WCDMA	3.84 MHz
LTE, LTETDD	4.515 MHz|4.5 MHz
Radio Test	25 kHz

Method for Carrier

Accesses the carrier configuration method settings.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe]?`
Example	`:ACP:CARR:LIST:FILT 0,0,0,0` `:ACP:CARR:LIST:FILT?`
Notes	The binary values translate as follows: `1|ON` — RRC Weighted `0|OFF` — Integ BW Maximum of Array length depends on the number of carriers Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	**Modes** / **Value**: SA, LTE, LTETDD — `OFF` WCDMA — `ON` Radio Test — `OFF`
State Saved	Saved in instrument state
Range	Integration BW | RRC Weighted

Filter Alpha for Carrier

Inputs the alpha value for the filter used in the current carrier configuration.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa <real>, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa?`
Example	`:ACP:CARR2:LIST:FILT:ALPH 0.5` `:ACP:CARR2:LIST:FILT:ALPH?`
Notes	Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications

Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.0

Offset

Lets you configure the spacing of the offset regions.

Offset Frequency Define

Lets you select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “From Carrier Center to Integ BW Closer Edge” definition. LTE conformance test requires “From Carrier Edge to Integ BW Center” and/or “From Carrier Edge to Integ BW Closer Edge” definition.

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW
`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
`ETOEdge`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge of each Offset Integ BW
`RTOCenter` 5G NR only	From either the lower or upper RF BW** edge frequency to the center frequency of each Offset Integ BW
`RTOEdge` 5G NR only	From either the lower or upper RF BW** edge frequency to the closest edge frequency of each Offset Integ BW
`RCTOCenter` 5G NR only	From the center frequency of RF BW** to the center frequency of each Offset Integ BW
`SCTOCenter` 5G NR only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** RF BW = BWchannel,CA which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier = 1, RF BW = $BW_{channel}$ = 2 x $F_{offset,RAT}$

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being

Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

See "Diagrams for Offset Freq Define" on page 972.

Modes other than MSR, LTEAFDD, LTEATDD, 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter	CTOEdge	ETOCenter	ETOEdge` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`
Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter|CTOEdge|ETOCenter|ETOEdge`

Mode: MSR, LTEAFDD, LTEATDD

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter	CTOEdge	ETOCenter	ETOEdge` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`
Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter|CTOEdge|ETOCenter|ETOEdge`

Mode: 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter	CTOEdge	ETOCenter	ETOEdge	RTOCenter	RTOEdge	RCTOCenter	SCTOCenter` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`
Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Preset	`CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter	CTOEdge	ETOCenter	ETOEdge	RTOCenter	RTOEdge	RCTOCenter	SCTOCenter`

Diagrams for Offset Freq Define

Details depend on the selected mode.

Diagram for Modes other than MSR, LTEAFDD, LTEATDD, 5G NR

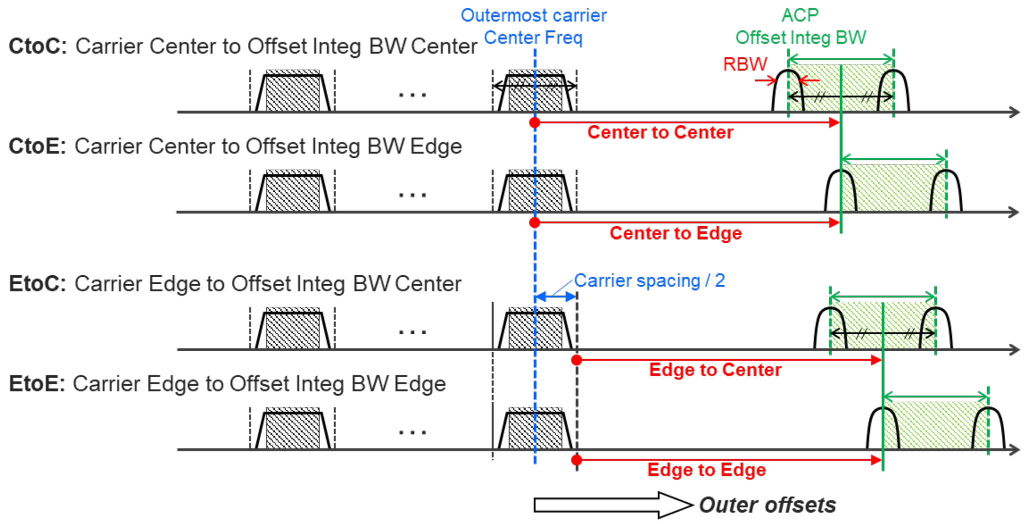


Diagram for MSR, LTEAFDD, LTEATDD, 5G NR

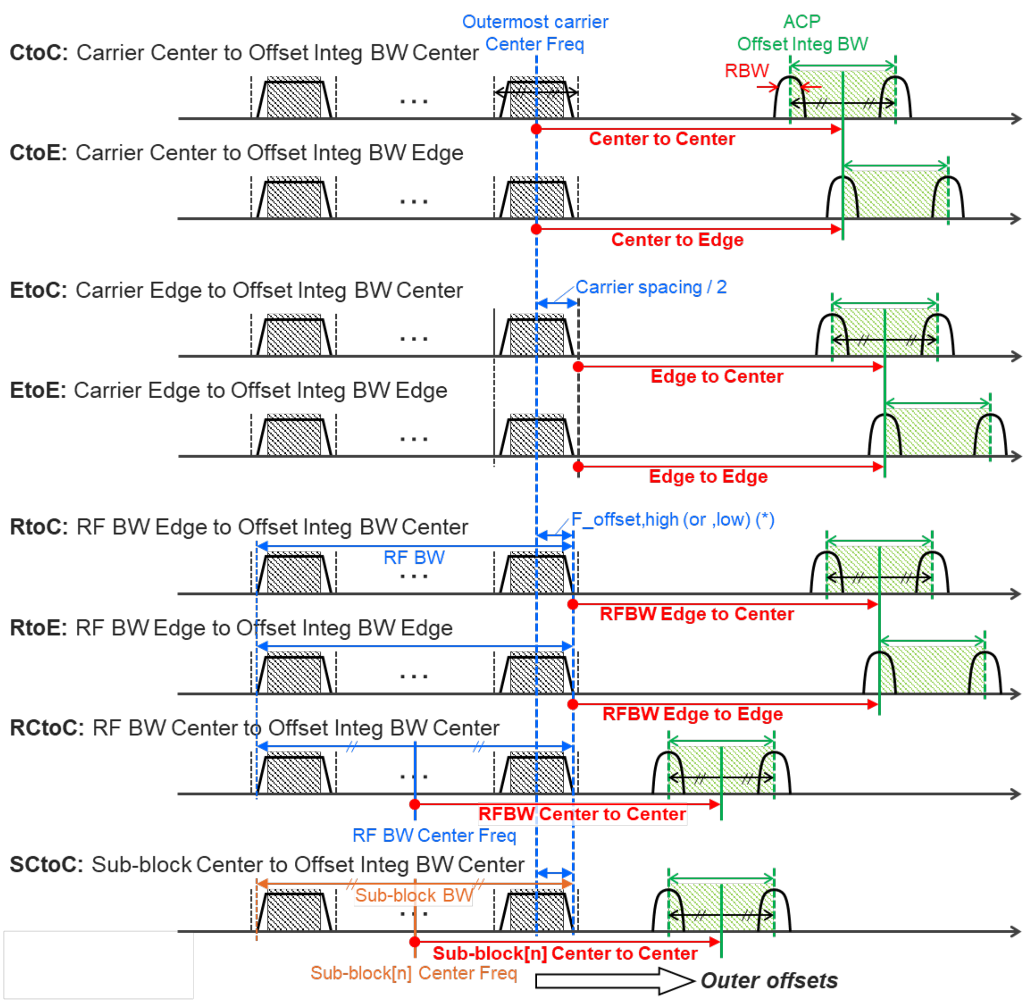


Note:

RF BW Edge and Outermost Carrier Edge are not always the same.
e.g.) 5G NR (3GPP) defines BW_channel, CA which calculates F_offset,high and F_offset,low asymmetrically with SCS shift.
(*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Freq

Determines the frequency difference between the center of the main channel and the center of the carrier.

Each **Offset Freq** state value is entered individually by selecting the desired carrier.

The list contains up to six (6) entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet:LIST:STATe`.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz, and causes it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST[:FREQuency] <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST[:FREQuency]?`
Example	`:ACP:OFFS1:LIST 0,0,0,0,0,0` `:ACP:OFFS1:LIST?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, in which case subsequent values are ignored
Couplings	Changing Offset Frequency might affect "Span" on page 948
Preset	When "Max Num of Offsets" on page 1000 is set to 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
WCDMA	5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
LTEAFDD, LTEATDD, MSR	5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
5G NR	100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
Radio Test	25 kHz, 50 kHz, 75 kHz, 0 Hz, 0 Hz, 0 Hz

State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST[:FREQuency]`

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe?`

Example	`:ACP:OFFS2:LIST:STAT 1,1,0,0,0,0` `:ACP:OFFS2:LIST:STAT?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	ON, OFF, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF
WCDMA	ON, ON, OFF, OFF, OFF, OFF | ON, ON, OFF, OFF, OFF, OFF
LTEAFDD, LTEATDD, MSR	ON, ON, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF
5G NR	ON, ON, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF
Radio Test	ON, ON, ON, OFF, OFF, OFF

State Saved	Yes
Range	OFF|ON

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST[:FREQuency]`.

Enter each value individually by selecting the desired offset, then enter the Offset Integration Bandwidth.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration] <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration]?`
Example	`:ACP:OFFS2:LIST:BAND 2MHz,2MHz,2MHz,2MHz,2MHz,2MHz` `:ACP:OFFS2:LIST:BAND?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, so, if you want to change the second value, you must send all values up to that. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values is ignored
Couplings	Changing **Integ BW** might affect "Span" on page 948
Preset	When "Max Num of Offsets" on page 1000 is set to 12, the preset value of Offset G ~ L is the same as

	the Offset F value **Modes** / **Values** SA: 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz|2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz WCDMA: 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz|3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz LTEAFDD, LTEATDD, MSR: 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz|4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz 5G NR: 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz|98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz Radio Test: 25 kHz, 25 kHz, 25 kHz, 25 kHz, 25 kHz, 25 kHz
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth[:INTegration]`
	`[:SENSe]:ACPR:OFFSet[1]|2:LIST:BANDwidth`
	`[:SENSe]:ACPR:OFFSet[1]|2:LIST:BWIDth`
	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:BANDwidth[:INTegration]`
	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:BWIDth[:INTegration]`

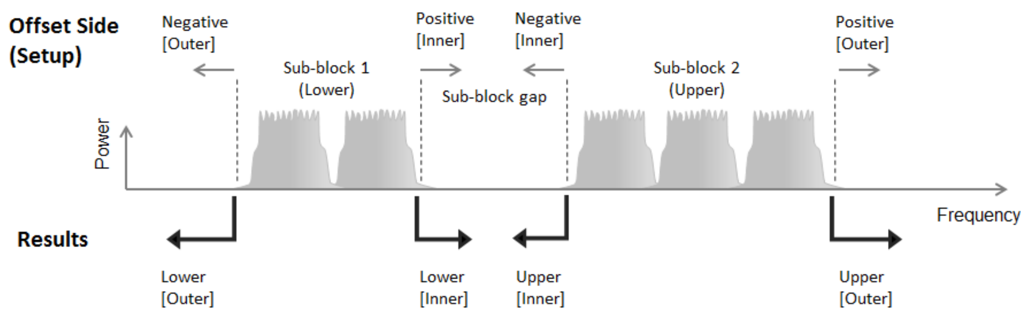
Offset Side

Specifies which offset side to measure.

You can turn off (not use) specific offsets with `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE`.

`NEGative`	Negative (lower) sideband only
`BOTH`	Both of the negative (lower) and positive (upper) sidebands
`POSitive`	Positive (upper) sideband only

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in MSR, LTEAFDD and LTEATDD Modes.



Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE NEGative | BOTH | POSitive, …` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE?`
Example	`:ACP:OFFS:LIST:SIDE BOTH` `:ACP:OFFS:LIST:SIDE?`
Notes	`OFFSet1` is for BTS, `2` for MS. Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored If you set `POS` or `NEG` in an offset, result of the inactive side returns -999
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is `BOTH` `BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
State Saved	Saved in instrument state
Range	`NEGative|BOTH|POSitive`

Method

Allows you to turn RRC filtering of each offset on or off. The value (roll off) for the filter will be set to the value of the **Filter Alpha** parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe]?`
Example	`:ACP:OFFS:LIST:FILT 1,0,0` `:ACP:OFFS:LIST:FILT?`
Notes	`1|ON` = RRC Weighted, `0|OFF` = Integ BW Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
SA	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0,0

	Mode	**Values**
	WCDMA	1, 1, 1, 1, 1, 1 | 1, 1, 1, 1, 1, 1
	LTEAFDD, LTEATDD, 5G NR, MSR	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0,0
	Radio Test	0, 0, 0, 0, 0, 0
State Saved	Saved in instrument state	
Range	Integ BW | RRC Weighted	

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa <real>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa?`	
Example	`:ACP:OFFS:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:LIST:FILT:ALPH?`	
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored	
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value	
	SA	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
	WCDMA	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
	LTEAFDD, LTEATDD, 5G NR, MSR	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
State Saved	Saved in instrument state	
Min/Max	0.01/1.00	

Advanced (Offset)

Opens a further menu page, which lets you set advanced properties of the Inner Offset, such as Res BW, Video BW, and Filter parameters.

Offset Freq

This column is the same as "Offset Freq" on page 1014 in the main **Offset** menu.

Res BW

Sets the resolution bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution?`
Example	`:ACP:OFFS2:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz` `:ACP:OFFS2:LIST:BAND:RES?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "Meas Method" on page 963 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated
Couplings	When **Res BW** Mode is **Auto**, this value is exactly same as **Res BW**. When you change this value, **Res BW** Mode also changes to **Man**
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value SA: 220 kHz, 220 kHz, 220 kHz, 220 kHz, 220 kHz, 220 kHz WCDMA: 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz LTEAFDD, LTEATDD, 5G NR, MSR: 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz | 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz
State Saved	Saved in instrument state
Min/Max	1 Hz/8 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:RESolution`

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution:AUTO ON | OFF | 1 | 0,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution:AUTO?`
Example	`:ACP:OFFS2:LIST:BAND:RES:AUTO 1,1,1,1,1,1` `:ACP:OFFS2:LIST:BAND:RES:AUTO?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 1 1, 1, 1, 1, 1, 1
State Saved	Yes
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:RESolution:AUTO`

Video BW

Enables you to change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo?`
Example	`:ACP:OFFS2:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz` `:ACP:OFFS2:LIST:BAND:VID?`
Notes	The values shown in this table reflect the conditions after **Mode Preset** Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "Meas Method" on page 963 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value **Modes** / **Values** SA: 22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz WCDMA: 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz LTEAFDD, LTEATDD, 5G NR, MSR: 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz
State Saved	Saved in instrument state
Min/Max	1 Hz/50 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo`

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO?`
Example	`:ACP:OFFS2:LIST:BAND:VID:AUTO 0,0,0,0,1,1` `:ACP:OFFS2:LIST:BAND:VID:AUTO?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is ON `ON, ON, ON, ON, ON, ON`
State Saved	Yes
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo:AUTO`

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe GAUSsian	FLATtop,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe?`
Example	`:ACP:OFFS2:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS` `:ACP:OFFS2:LIST:BAND:SHAP?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "Res BW" on page 929 Mode for the offset is **Auto**, this cell is grayed out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 963 to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is `GAUSsian GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian`
State Saved	Saved in instrument state
Range	`GAUSsian|FLATtop`
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:SHAPe`

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE DB3	DB6,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE?`
Example	`:ACP:OFFS2:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3` `:ACP:OFFS2:LIST:BAND:TYPE?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "RBW Filter Type" on page 933 is Flattop, or "Res BW" on page 929 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 963 to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is `DB3`

	DB3, DB3, DB3, DB3, DB3, DB3
State Saved	Saved in instrument state
Range	–3 dB (Normal)| –6 dB
Backwards Compatibility SCPI	[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:TYPE

Limits

Lets you configure the limits that are used to determine whether the offset regions PASS or FAIL the limit test.

Limit Test

This checkbox is the same as "Limit Test" on page 982 in the **Meas Setup, Settings** tab.

Offset Freq

This column is the same as "Offset Freq" on page 1014 in the **Offset** index tab.

Abs Limit

Specifies an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain 6 entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe command.

The query returns the six (6) sets of real numbers that are the current absolute amplitude test limits.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute < real>,… [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute?
Example	:ACP:OFFS2:LIST:ABS -10,-10,-10,-10,-10,-10 :ACP:OFFS2:LIST:ABS?
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the

	Offset F value **Modes** / **Values** SA: 0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm | 0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm WCDMA: 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm | 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm LTEAFDD, LTEATDD, MSR: -8.45, -8.45, -8.45, -8.45, -8.45, -8.45 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0 5G NR: 4.92, 4.92, 4.92, 4.92, 4.92, 4.92 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0
State Saved	Saved in instrument state
Min/Max	-200.0 dBm/50.0 dBm

Backwards Compatibility SCPI	`[:SENSe]:ACPR:OFFSet[1]|2:LIST:ABSolute`
	SA, W-CDMA
	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:ABSolute`
	SA, W-CDMA

Rel Limit (Car)

Enters a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier <real>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier?`
Example	`:ACP:OFFS2:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:LIST:RCAR?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored

Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value **Modes** / **Values** SA: -45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0 WCDMA: -44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2 LTEAFDD, LTEATDD, MSR: -44.2, -44.2, -44.2, -44.2, -44.2, -44.2 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2 5G NR: -43.8, -43.8, -43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2 Radio Test: -60, -60, -60, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150/50.0
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:RCARrier`

Positive Offset Limit (Remote Command only)

Enables you to set the upper limit for the upper segment of the specified offset pair.

Remote Command	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:POSitive[:UPPer]:DATA <real>,...` `:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:POSitive[:UPPer]:DATA?`
Example	`:CALC:ACP:OFFS:LIST:LIM:POS:DATA 0,0,0,0,0,0` `:CALC:ACP:OFFS:LIST:LIM:POS:DATA?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value **Modes** / **Values** SA: -45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0 WCDMA: -44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2 LTEAFDD, LTEATDD, MSR: -44.2,-44.2,-44.2,-44.2,-44.2,-44.2 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2 5G NR: -43.8, -43.8, -43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2 Radio Test: -60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0/50.0
Backwards Compatibility SCPI	`:CALCulate:MCPower:OFFSet:LIST:LIMit:POSitive[:UPPer]:DATA` (Power Suite)

Negative Offset Limit(Remote Command only)

Enables you to set the upper limit for the lower segment of the specified offset pair.

Remote Command	`:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer]:DATA <real>,...` `:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer]:DATA?`
Example	`:CALC:ACP:OFFS:LIST:LIM:NEG:DATA 0,0,0,0,0,0` `:CALC:ACP:OFFS:LIST:LIM:NEG:DATA?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0
WCDMA	-44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2

Min/Max	-150.0/50.0
Backwards Compatibility SCPI	`:CALCulate:MCPower:OFFSet:LIST:LIMit:NEGative[:UPPer]:DATA` (Power Suite, WCDMA)

Rel Limit (PSD)

Enters a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity <rel_ampl>,… [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity?
Example	:ACP:OFFS2:LIST:RPSD 10,10,10,10,10,10 :ACP:OFFS2:LIST:RPSD?
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB | -28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB
WCDMA	-44.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB | -32.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB
LTEAFDD, LTEATDD, 5G NR, MSR	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0, 0
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that lets you select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:ABSolute, or the relative values defined with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RPSDensity and [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RCARrier.

You can turn off (not use) specific offsets with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe.

Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit**
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***and* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***or* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST ABSolute | AND | OR | RELative,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST?`
Example	`:ACP:OFFS2:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:LIST:TEST?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA, WCDMA	`REL, REL, REL, REL, REL, REL | REL, REL, REL, REL, REL, REL`
LTEAFDD, LTEATDD, 5G NR, MSR	`AND, AND, AND, AND, AND, AND | AND, AND, AND, AND, AND, AND`
Radio Test	`REL, REL, REL, REL, REL, REL`

State Saved	Saved in instrument state
Range	`ABSolute|AND|OR|RELative`
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:TEST`

Offset Frequency Define

Allows you to select "Offset" definition:

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW

ETOCenter	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
ETOEdge	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge frequency of each Offset Integ BW
STOCenter	From either the lower or upper sub-block edge frequency to the center frequency of each Offset Integ BW
STOEdge	From either the lower or upper sub-block edge frequency to the closest edge frequency of each Offset Integ BW
SCTOCenter 5G NR only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

See "Diagram for Offset Freq Define" on page 989

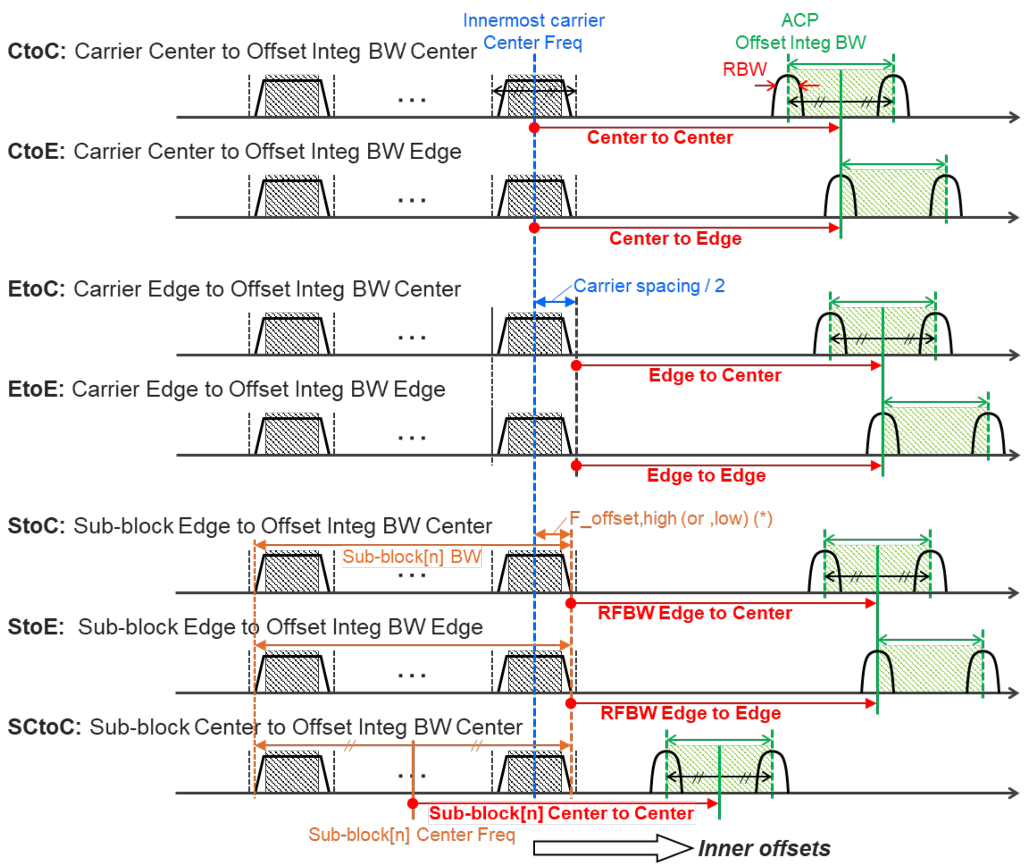
Mode: MSR, LTEAFDD, LTEATDD

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE?`
Example	`:ACP:OFFS:INN:TYPE ETOC` `:ACP:OFFS:INN:TYPE?`
Preset	STOCenter
State Saved	Saved in instrument state
Range	CTOCenter|CTOEdge|ETOCenter|ETOEdge|STOCenter|STOEdge

Mode: 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge | SCTOCenter` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE?`
Example	`:ACP:OFFS:INN:TYPE ETOC` `:ACP:OFFS:INN:TYPE?`
Preset	STOCenter | CTOCenter
State Saved	Saved in instrument state
Range	CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge | SCTOCenter

Diagram for Offset Freq Define



Note:

RF BW Edge and Outermost Carrier Edge are not always same.
e.g.) 5G NR (3GPP) defines BW_channel,CA which calculates F_offset,high and F_offset,low asymmetrically with SCS shift

(*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Freq

Determines the frequency difference between the center of the main channel and the center of the carrier. When set to Offset to Edge, this parameter determines the frequency difference between the center of the main channel and the near edge of the offset.

Each **Offset Freq** state value is entered individually by selecting the desired carrier. Use the **Enabled** checkbox to turn the **Offset Freq** State on or off.

The list contains up to 6 entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz, and causes it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST[:FREQuency] <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST[:FREQuency]?`
Example	`:ACP:OFFS1:INN:LIST 0,0,0,0,0,0` `:ACP:OFFS1:INN:LIST?`
Notes	When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Couplings	Changing Offset Frequency might affect "Span" on page 948
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value
State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

Modes	Values
5G NR	10 MHz, 30 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
All Others	2.5MHz,7.5MHz,0,0,0,0 | 2.5MHz,7.5MHz,0,0,0,0

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe?`
Example	`:ACP:OFFS2:INN:LIST:STAT 1,1,0,0,0,0` `:ACP:OFFS2:INN:LIST:STAT?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value `ON, ON, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF`
State Saved	Yes

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by `[:SENSe]:ACP:OFFSet[n]:INNer:LIST[:FREQuency]`.

Enter each value individually by selecting the desired offset on the **Offset** menu key using the up down arrows, the knob, or the numeric keypad, then enter the Offset Integration Bandwidth using the **Offset Integration Bandwidth** menu key.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth[:INTegration] <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth[:INTegration]?`
Example	`:ACP:OFFS2:INN:LIST:BAND 2MHz,2MHz,2MHz,2MHz,2MHz,2MHz` `:ACP:OFFS2:INN:LIST:BAND?`
Notes	When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, so, if you want to change the second value you must send all values up to it. Subsequent values remain unchanged Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Couplings	Changing Integ BW might affect "Span" on page 948
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
LTEAFDD	3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz | 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz
MSR, LTEATDD	4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz | 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz
5G NR	19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz | 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz

State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

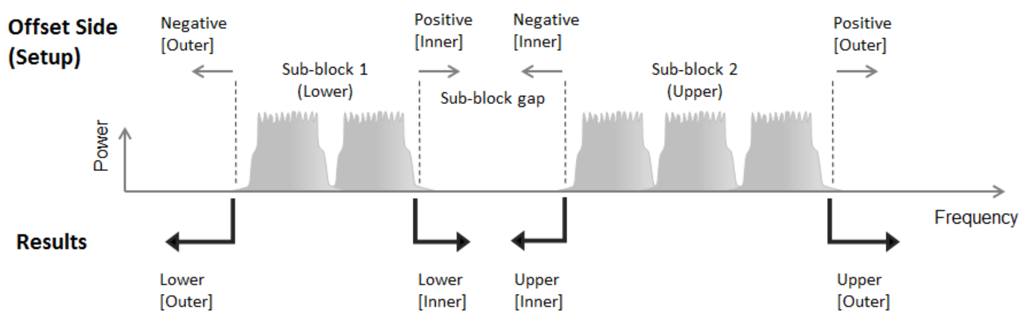
Offset Side

Lets you turn off (not use) specific offsets with `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE`.

- `NEGative` - The upper side in the sub-block gap only (that is, negative sideband of the upper sub-block) is enabled

- BOTH - Both sides in the sub-block gap are enabled
- POSitive - The lower side in the sub-block gap only (that is, positive sideband of the lower sub-block) is enabled

The diagram below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR, LTEAFDD and LTEATDD Modes.



Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE NEGative | BOTH | POSitive, …` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE?`
Example	`:ACP:OFFS:INN:LIST:SIDE BOTH` `:ACP:OFFS:INN:LIST:SIDE?`
Notes	OFFSet1 is for BTS, 2 for MS. Default is BTS If you set POS or NEG in an offset, result of the inactive side returns -999
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is BOTH BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH
State Saved	Saved in instrument state
Range	NEGative|BOTH|POSitive

Method

Lets you turn RRC filtering of each offset on or off. The value (roll off) for the filter is set to the value of the Filter Alpha parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe]?`
Example	`:ACP:OFFS:INN:LIST:FILT 1,0,0` `:ACP:OFFS:INN:LIST:FILT?`
Notes	1|ON = RRC Weighted, 0|OFF = Integ BW
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

	Modes	**Values**
	LTEAFDD	1,1,1,1,1,1 | 1,1,1,1,1,1
	MSR, LTEATDD, 5G NR	0,0,0,0,0,0 | 0,0,0,0,0,0
State Saved	Saved in instrument state	
Range	Integ BW | RRC Weighted	

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa <real>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa?`
Example	`:ACP:OFFS:INN:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:INN:LIST:FILT:ALPH?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 0.22 0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.00

Offset Freq

The same as "Offset Freq" on page 1030 in the main **Inner Offset** menu.

Res BW

Sets the Resolution Bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution?`
Example	`:ACP:OFFS2:INN:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz` `:ACP:OFFS2:INN:LIST:BAND:RES?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Dependencies	When "Meas Method" on page 963 is RBW, FAST or Fast Power, this control is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated
Couplings	When "Res BW" on page 929 Mode is **Auto**, this value is exactly the same as **Res BW**. When you change this value, **Res BW** Mode also changes to **Man**
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 100 kHz

	100 kHz, 100 kHz, 100k Hz, 100 kHz | 100 kHz,100 kHz, 100 kHz,100 kHz, 100 kHz, 100 kHz
State Saved	Saved in instrument state
Min/Max	1 Hz/8 MHz

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO ON | OFF | 1 | 0,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO?`
Example	`:ACP:OFFS2:INN:LIST:BAND:RES:AUTO 1,1,1,1,1,1` `:ACP:OFFS2:INN:LIST:BAND:RES:AUTO?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 1 1, 1, 1, 1, 1, 1
State Saved	Yes

Video BW

Lets you change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo?`
Example	`:ACP:OFFS2:INN:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz` `:ACP:OFFS2:INN:LIST:BAND:VID?`
Notes	The values shown in this table reflect the conditions after **Mode Preset** Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Dependencies	When "Meas Method" on page 963 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 1 MHz 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz
State Saved	Yes
Min/Max	1 Hz/50 MHz

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO?`
Example	`:ACP:OFFS2:INN:LIST:BAND:VID:AUTO 0,0,0,0,1,1` `:ACP:OFFS2:INN:LIST:BAND:VID:AUTO?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is ON

	ON, ON, ON, ON, ON, ON
State Saved	Yes

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe GAUSsian | FLATtop,… [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe?
Example	:ACP:OFFS2:INN:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS :ACP:OFFS2:INN:LIST:BAND:SHAP?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink)
Dependencies	When "Res BW" on page 929 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 963 to RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is GAUSsian GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian
State Saved	Saved in instrument state
Range	GAUSsian|FLATtop

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE DB3 | DB6,… [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE?
Example	:ACP:OFFS2:INN:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3 :ACP:OFFS2:INN:LIST:BAND:TYPE?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink)
Dependencies	When "RBW Filter Type" on page 933 is FLATtop or "Res BW" on page 929 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 963 to RBW, FAST or Fast Power, this cell is also grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is DB3 DB3, DB3, DB3, DB3, DB3, DB3
State Saved	Saved in instrument state
Range	–3 dB (Normal)| –6 dB

Power Ref Type

Lets you set reference types of inner offsets.

CUMulative	Cumulated power of the upper and lower sub-block carriers is the reference level. This selection is effective only when one of the following "Power Ref" on page 1045 values is selected: Left & Right Carriers — LRCarriers Max Power Carrier in Sub-block — MPCSubblock Min Power Carrier in Sub-block — MINSubbloc Left & Right Sub-blocks — LRSubblocks Manual — MANual When one of the other **Power Ref** values is selected, carrier powers are not cumulated, and the reference level is equivalent to Normal
NORMal	Power of specified carrier or the manual reference level is the reference level

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence CUMulative | NORMal, …` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence?`
Example	`:ACP:OFFS:INN:LIST:PREF CUM,CUM,NORM,NORM,NORM,NORM` `:ACP:OFFS:INN:LIST:PREF?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is NORMal NORMal, NORMal, NORMal, NORMal, NORMal, NORMal
State Saved	Saved in instrument state
Range	CUMulative|NORMal

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence:AUTO OFF | ON | 0 | 1, …` `[:SENSe]:ACPower:OFFSet[1] | 2:INNer:LIST:PREFerence:AUTO?`
Example	`:ACP:OFFS:INN:LIST:PREF:AUTO OFF,OFF,OFF,OFF,OFF,OFF` `:ACP:OFFS:INN:LIST:PREF:AUTO?`
Dependencies	Available only in LTEAFDD, LTEATDD and 5G NR Modes
Couplings	When in the LTEAFDD, LTEATDD Modes, the inner power ref type is set automatically when the power ref type state is auto according to the scopes of the sub-block gap in the following table

Sub-block Gap	Inner ACP offset	Power Ref Type
Wgap <5MHz	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Normal

Sub-block Gap	Inner ACP offset	Power Ref Type
5MHz≤ Wgap <10MHz	1st (2.5MHz)	Cumulative
	2nd (7.5MHz)	Normal
10MHz≤ Wgap <15MHz	1st (2.5MHz)	Cumulative
	2nd (7.5MHz)	Cumulative
15MHz≤ Wgap <20MHz	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Cumulative
20MHz≤ Wgap	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Normal

When in 5G NR Mode, Power Ref Type "Auto" sets the power reference type of inner-ACLR offset automatically

Downlink: "Cumulative" or "Normal" is selected accordingly when the inner-offsets are configured to meet the test requirements as follows:

FR1, 3GPP TS 38.141-1 v16.5.0 (2020-09) Section 6.6.3.5.3 BS type 1-C:

- Table 6.6.3.5.2-3: Base Station ACLR limit in non-contiguous spectrum or multiple bands
- Table 6.6.3.5.2-4: Base station CACLR limit

FR2, 3GPP TS 38.141-2 v16.5.0 (2020-09) Section 6.7.3.5.3 BS type 2-O:

- Table 6.7.3.5.2-3: BS type 2-O ACLR limit in non-contiguous spectrum
- Table 6.7.3.5.2-4: BS type 2-O CACLR limit in non-contiguous spectrum

Uplink: "Normal" is always selected

Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value `ON, ON, ON, ON, ON, ON	OFF, OFF, OFF, OFF, OFF, OFF`
State Saved	Saved in instrument state
Range	`Auto|Man`

Limit Test

This checkbox is the same as "Limit Test" on page 1023 in the **Settings** tab.

Offset Freq

This column is the same as "Offset Freq" on page 1030 in the **Offset** tab.

Abs Limit

Specifies an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain 6 entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. [:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with [:SENSe]:ACP:OFFSet [n]:INNer:LIST:STATe.

The query returns the 6 sets of real numbers that are the current absolute amplitude test limits.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute < real>,… [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute?
Example	:ACP:OFFS2:INN:LIST:ABS -10,-10,-10,-10,-10,-10 :ACP:OFFS2:INN:LIST:ABS?
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value **Modes** / **Values** 5G NR: -2.2, -2.2, -2.2, -2.2, -2.2, -2.2 | -50.0,-50.0,-50.0,-50.0,-50.0,-50.0 All Others: -8.45,-8.45,-8.45,-8.45,-8.45,-8.45 | -50.0,-50.0,-50.0,-50.0,-50.0,-50.0
State Saved	Saved in instrument state
Min/Max	-200.0 dBm/50.0 dBm

Rel Limit (Car)

Specifies a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list. [:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with [:SENSe]:ACP:OFFSet [n]:INNer:LIST:STATe.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier <real>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier?`
Example	`:ACP:OFFS2:INN:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:INN:LIST:RCAR?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value **Modes** / **Values** 5G NR: -43.8, -43.8, 43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2 All Others: -44.2, -44.2,-44.2,-44.2,-44.2,-44.2 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
State Saved	Saved in instrument state
Min/Max	-150/50.0

Rel Limit (PSD)

Specifies a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity <rel_ampl>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity?`
Example	`:ACP:OFFS2:INN:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:INN:LIST:RPSD?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 0 0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that enables you to select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:ABSolute`, or the relative values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RPSDensity` and `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RCARrier`.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Option	SCPI	Description
Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *and* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *or* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST ABSolute | AND | OR | RELative,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST?`
Example	`:ACP:OFFS2:INN:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:INN:LIST:TEST?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is AND `AND, AND, AND, AND, AND, AND | AND, AND, AND, AND, AND, AND`
State Saved	Saved in instrument state
Range	`ABSolute|AND|OR|RELative`

Max Num of Offsets

Sets the max number of offsets: either 6 or 12.

This setting applies only to SCPI operations. To specify the same behavior as that of the previous version, selecting 6 offsets is recommended. If you select 12 offsets, the results returned by the `:READ|:FETCh` queries increase accordingly.

Example:

When you select 6 offsets, querying the offset state returns 6 values, as below.

```
-> :SENSe:ACPower:OFFSet:LIST:STATe?
<- 1,0,0,0,0,0
```

When you select 12 offsets, sending the same query returns 12 values, as below.

```
-> :SENSe:ACPower:OFFSet:LIST:STATe?
<- 1,0,0,0,0,0,0,0,0,0,0,0
```

If your program depends on the number of returned values, you should select 6 offsets, or else change your program.

Remote Command	`[:SENSe]:ACPower:OFFSet:MAXNumber NUM6 | NUM12` `[:SENSe]:ACPower:OFFSet:MAXNumber?`
Example	`:ACP:OFFS:MAXN NUM12` `:ACP:OFFS:MAXN?`
Preset	`NUM6`
State Saved	Saved in instrument state
Range	6|12

Limit Test

Turns limit checking for each offset On or Off. The limits may be specified in the **Offset** menu, for each offset, both sides of the carrier. For results that fail the limit, a red F is appended. In the **Combined** view, the bar turns red.

Remote Command	`:CALCulate:ACPower:LIMit:STATe OFF | ON | 0 | 1` `:CALCulate:ACPower:LIMit:STATe?`
Example	`:CALC:ACP:LIM:STAT OFF` `:CALC:ACP:LIM:STAT?`
Preset	SA: `OFF` WCDMA, LTEAFDD, LTEATDD, 5G NR, MSR: `ON`
State Saved	Saved in instrument state
Range	`ON|OFF`
Backwards Compatibility SCPI	`[:SENSe]:MCPower:LIMit[:STATe]` `[:SENSe]:ACPower:LIMit[:STATe]`

Spur Avoidance

Because VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in multiple capture case.

You can disable this function to speed up your measurement by setting **Spur Avoidance** to **Disabled**.

Note that when **Spur Avoidance** is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message appears in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be impacted by the fact that **Spur Avoidance** is not in effect.

Remote Command	`[:SENSe]:ACPower:SAVoid[:STATe] ON | OFF | 0 | 1` `[:SENSe]:ACPower:SAVoid[:STATe]?`
Example	`:ACP:SAVoid ON` `:ACP:SAVoid?`
Dependencies	Only appears in VXT models M9410A/11A/15A
Preset	`OFF`
State Saved	Saved in instrument state
Range	`ON|OFF`

Meas Setup Summary Table

Lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all **Auto/Man** functions into **Auto**. **Auto Couple** is confined to the current measurement only. It does not affect other measurements in the Mode.

In the **Auto** state, **Auto/Man** functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. **Auto Couple** is an immediate action function, and when it is executed, all the **Auto/Man** controls for the current measurement are set to **Auto**, and all measurement settings coupled to the **Auto/Man** parameters are automatically set to their optimal values.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 1003 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All **Auto/Man** parameter couplings in the measurement are set to **Auto**. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no **Auto/Man** coupling for **RBW** while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span, it would set **RBW** to Auto "behind the scenes" so that, on exit from Zero Span, it would be in **Auto**.

Any **Auto/Man** selection specific (local) to the other measurements in the current Mode are not affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as **AutoRange** or **AutoScale**, are not affected.

Executing **Auto Couple** generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to **Auto**, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that depend on one or more other parameters. The coupling and dependency rules for each parameter are defined in the section describing that parameter.

Executing **Auto Couple***does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI (SA Mode only)

Parameters affected by **Auto Couple** are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BANDwidth VBW/RBW ratio
- Upper and Lower Tone (set to Sense)
- Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics (SA Mode only)

Parameters affected by **Auto Couple** are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	`:CONFigure:ACPower`
Example	`:CONF:ACP`
Couplings	Selecting **Meas Preset** restores all measurement parameters to their default values

3.5.13.2 Reference

All ACP measurements are taken relative to a specific carrier frequency, relative to whose power the offset channel power is measured.

The controls on this tab let you specify the reference carrier frequency and other parameters relevant to the reference carrier.

Number of Carriers

Specifies the number of carriers to be measured.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:COUNt <integer>` `[:SENSe]:ACPower:CARRier[1]|2:COUNt?`
Example	`:ACP:CARR:COUN 1` `:ACP:CARR:COUN?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	When Number of Carriers is 1, Ref Carrier is grayed out Does not appear in MSR, LTEAFDD, LTEATDD and 5G NR Modes. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE-A converged applications
Couplings	Changing this parameter might affect "Span" on page 948
Preset	1
State Saved	Saved in instrument state
Min/Max	1/18
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:COUNt` (Power Suite)

Carrier/Offset/Limits Config

This is the same dialog as "Carrier/Offset/Limits Config" on page 965 in the **Settings** menu.

Carrier

Lets you configure your carriers, carrier spacing, noise bandwidth and measurement method.

Dependencies	Appears in all Modes except MSR, LTEAFDD, LTEATDD and 5G NR

Number of Carriers

This is the same as "Number of Carriers" on page 1005 under **Reference**.

Couple to #1

Couples carrier settings to carrier #1. The coupled parameters are:

– "Carrier Pwr Present" on page 1006
– "Carrier Spacing" on page 1007
– "Measurement Noise Bandwidth" on page 1008
– "Method for Carrier " on page 1009
– "Filter Alpha for Carrier" on page 1010

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle OFF | ON | 0 | 1, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle?`
Example	`:ACP:CARR:LIST:COUP OFF` `:ACP:CARR:LIST:COUP?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD, the SCPI command is supported in LTE & LTE-A converged applications
Couplings	When ON, the carrier settings are coupled to carrier #1. Coupled parameters are: Carrier Power Present, Carrier Spacing, Measurement Noise Bandwidth, Method and Filter Alpha When a setting is changed, coupling is switched off automatically Carrier #1 is always set to ON and cannot be changed
Preset	ON
State Saved	Saved in instrument state

Carrier Pwr Present

Configures the carriers for this measurement. Allows spaces to be inserted between carriers. Carriers with the power present parameter set to YES are carriers, and those with the power present parameter set to NO are spaces. Each carrier power present is set to YES or NO. The individual carrier can be set by selecting the desired carrier.

The query returns the current values for all of the carriers. If a carrier is defined as having no power present, the power displayed is relative to the reference carrier, otherwise the absolute power is displayed.

If you change the carrier power present to NO, and that carrier is currently configured as the reference carrier, the next carrier to the left (or the right if there are no carriers to the left) is assigned as the reference carrier. This also applies to the scenario where there are only two carriers configured as having power present, and you configure only one carrier to have no power present.

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent YES | NO, … [:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent?
Example	:ACP:CARR2:LIST:PPR YES :ACP:CARR2:LIST:PPR?
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. To maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applic-ations
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list
Preset	YES
State Saved	Saved in instrument state
Backwards Compatibility SCPI	[:SENSe]:MCPower:CARRier[1]|2:LIST:PPResent

Carrier Spacing

Sets the width of the carrier spacing. This is the value applied to all the current slots, whether they are carriers or spaces.

Enter each carrier spacing value individually by selecting the desired carrier, and then enter the carrier width.

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh <freq>, … [:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh?
Example	:ACP:CARR2:LIST:WIDT 25kHz :ACP:CARR2:LIST:WIDT?
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored

	When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. To maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list Changing Carrier Spacing might affect "Span" on page 948
Preset	SA, WCDMA, LTE, LTETDD Modes: 5 MHz Radio Test Mode: 25 kHz
State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:LIST:WIDTh`

Measurement Noise Bandwidth

Specifies the **Measurement Noise Bandwidth** used to calculate the power in the carriers.

Each **Measurement Noise Bandwidth** value is entered individually by selecting the desired carrier. Enter the measurement noise bandwidth on the **Carrier** page of the **Carr/Offset/Limits Config** dialog.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration] <freq>, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]?`
Example	`:ACP:CARR2:LIST:BAND 25kHz` `:ACP:CARR2:LIST:BAND?`
Notes	In WCDMA Mode, the preset/default value is defined as 3.84 MHz, but internally, 4.6848 MHz is used as the default value Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, so if you want to change values 2 and 6, you must send all values up to 6. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compat-

	ibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	Coupled to number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list
Preset	**Modes** / **Value** SA: 2 MHz WCDMA: 3.84 MHz LTE, LTETDD: 4.515 MHz|4.5 MHz Radio Test: 25 kHz
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

Backwards Compatibility SCPI	`[:SENSe]:ACPower:BANDwidth:INTegration`
	`[:SENSe]:ACPower:BWIDth:INTegration`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]`
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

Method for Carrier

Accesses the carrier configuration method settings.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe]?`
Example	`:ACP:CARR:LIST:FILT 0,0,0,0` `:ACP:CARR:LIST:FILT?`
Notes	The binary values translate as follows: `1|ON`: RRC Weighted `0|OFF`: Integ BW Maximum of Array length depends on the number of carriers Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	**Modes** / **Value** SA, LTE, LTETDD: `OFF`

	Modes	**Value**
	WCDMA	ON
	Radio Test	OFF
State Saved	Saved in instrument state	
Range	Integration BW | RRC Weighted	

Filter Alpha for Carrier

Inputs the alpha value for the filter used in the current carrier configuration.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa <real>, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa?`
Example	`:ACP:CARR2:LIST:FILT:ALPH 0.5` `:ACP:CARR2:LIST:FILT:ALPH?`
Notes	Some Modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTEAFDD or LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.0

Offset

Lets you configure the spacing of the offset regions.

Offset Frequency Define

Lets you select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “From Carrier Center to Integ BW Closer Edge” definition. LTE conformance test requires “From Carrier Edge to Integ BW Center” and/or “From Carrier Edge to Integ BW Closer Edge” definition.

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency

	(for upper offset) to the closest edge frequency of each Offset Integ BW
ETOCenter	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
ETOEdge	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge of each Offset Integ BW
RTOCenter 5G NR only	From either the lower or upper RF BW** edge frequency to the center frequency of each Offset Integ BW
RTOEdge 5G NR only	From either the lower or upper RF BW** edge frequency to the closest edge frequency of each Offset Integ BW
RCTOCenter 5G NR only	From the center frequency of RF BW** to the center frequency of each Offset Integ BW
SCTOCenter 5G NR only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** RF BW = BWchannel,CA which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier = 1, RF BW = $BW_{channel}$ = 2 x $F_{offset,RAT}$

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

See "Diagrams for Offset Freq Define" on page 1012.

Modes other than MSR, LTEAFDD, LTEATDD, 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`
Example	`:ACP:OFFS:TYPE ETOC` `:ACP:OFFS:TYPE?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	CTOCenter
State Saved	Saved in instrument state
Range	CTOCenter|CTOEdge|ETOCenter|ETOEdge

Mode: MSR, LTEAFDD, LTEATDD

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?
Example	:ACP:OFFS:TYPE ETOC :ACP:OFFS:TYPE?
Preset	CTOCenter
State Saved	Saved in instrument state
Range	CTOCenter|CTOEdge|ETOCenter|ETOEdge

Mode: 5G NR

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | RTOCenter | RTOEdge | RCTOCenter | SCTOCenter [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?
Example	:ACP:OFFS:TYPE ETOC :ACP:OFFS:TYPE?
Preset	CTOCenter
State Saved	Saved in instrument state
Range	CTOCenter | CTOEdge | ETOCenter | ETOEdge | RTOCenter | RTOEdge | RCTOCenter | SCTOCenter

Diagrams for Offset Freq Define

Details depend on the selected mode.

Diagram for Modes other than MSR, LTEAFDD, LTEATDD, 5G NR

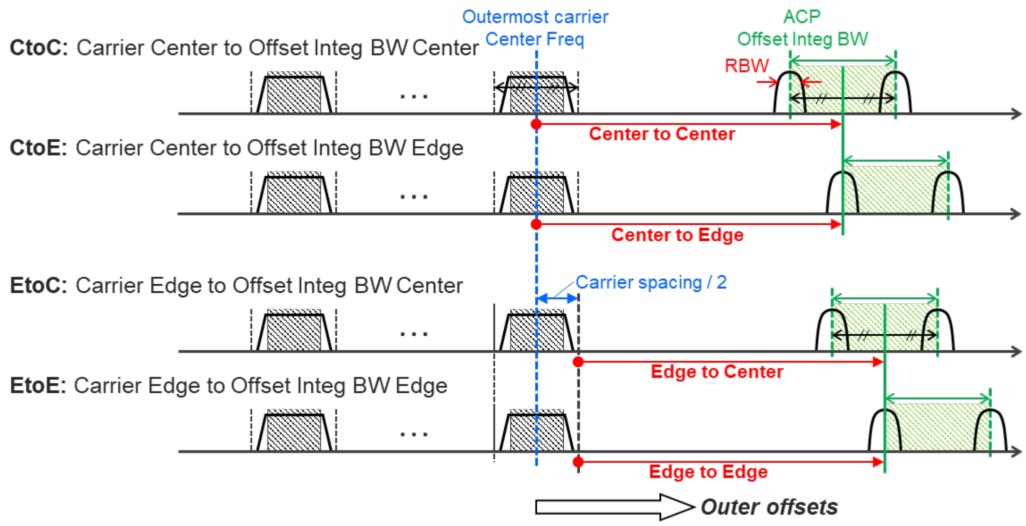


Diagram for MSR, LTEAFDD, LTEATDD, 5G NR

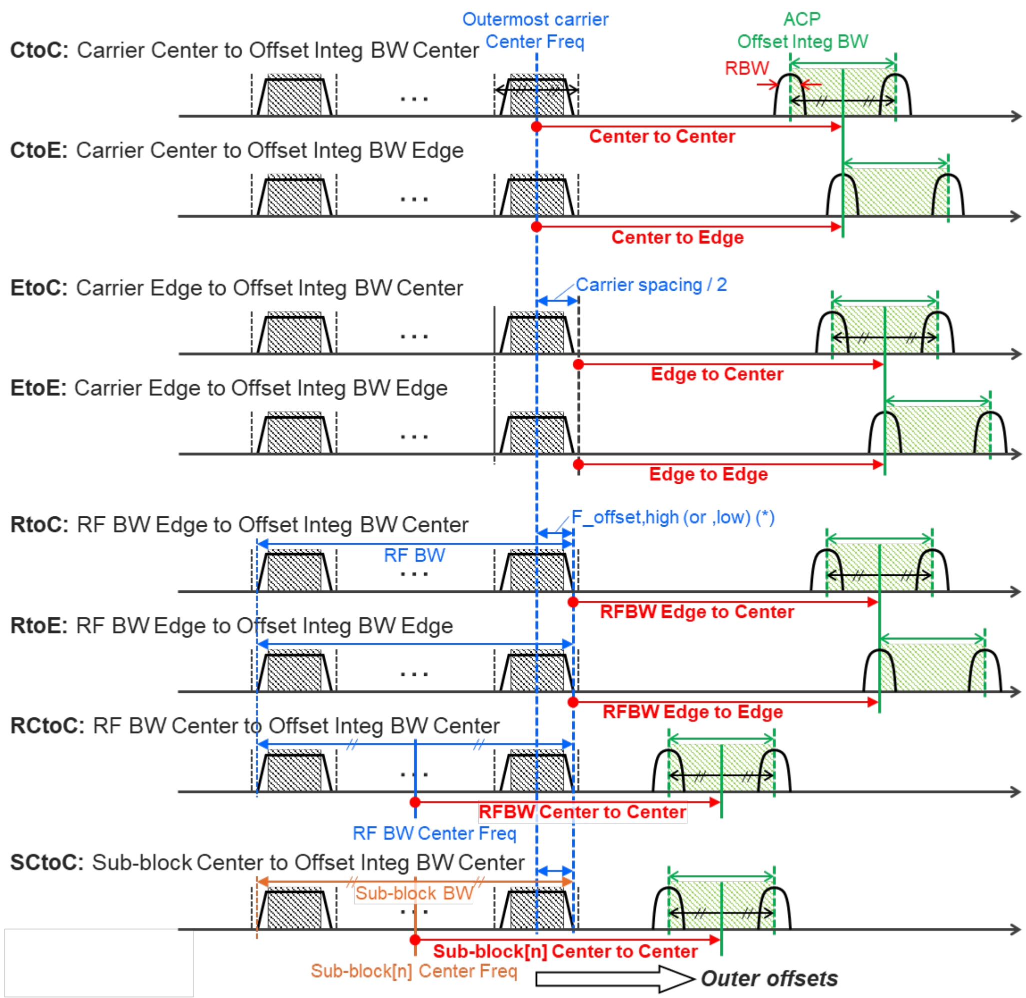


Note:

RF BW Edge and Outermost Carrier Edge are not always the same.
e.g.) 5G NR (3GPP) defines BW_channel, CA which calculates F_offset,high and F_offset,low asymmetrically with SCS shift.
(*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Freq

Determines the frequency difference between the center of the main channel and the center of the carrier.

Each **Offset Freq** state value is entered individually by selecting the desired carrier.

The list contains up to six (6) entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet:LIST:STATe`.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz, and causes it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST[:FREQuency] <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST[:FREQuency]?`
Example	`:ACP:OFFS1:LIST 0,0,0,0,0,0` `:ACP:OFFS1:LIST?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, in which case subsequent values are ignored
Couplings	Changing Offset Frequency might affect "Span" on page 948
Preset	When "Max Num of Offsets" on page 1000 is set to 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
WCDMA	5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
LTEAFDD, LTEATDD, MSR	5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
5G NR	100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
Radio Test	25 kHz, 50 kHz, 75 kHz, 0 Hz, 0 Hz, 0 Hz

State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST[:FREQuency]`

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe?`

Example	:ACP:OFFS2:LIST:STAT 1,1,0,0,0,0 :ACP:OFFS2:LIST:STAT?
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	ON, OFF, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF
WCDMA	ON, ON, OFF, OFF, OFF, OFF | ON, ON, OFF, OFF, OFF, OFF
LTEAFDD, LTEATDD, MSR	ON, ON, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF
5G NR	ON, ON, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF
Radio Test	ON, ON, ON, OFF, OFF, OFF

State Saved	Yes
Range	OFF|ON

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST[:FREQuency].

Enter each value individually by selecting the desired offset, then enter the Offset Integration Bandwidth.

You can turn off (not use) specific offsets with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration] <freq>,… [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration]?
Example	:ACP:OFFS2:LIST:BAND 2MHz,2MHz,2MHz,2MHz,2MHz,2MHz :ACP:OFFS2:LIST:BAND?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, so, if you want to change the second value, you must send all values up to that. Subsequent values remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values is ignored
Couplings	Changing **Integ BW** might affect "Span" on page 948
Preset	When "Max Num of Offsets" on page 1000 is set to 12, the preset value of Offset G ~ L is the same as

	the Offset F value **Modes** / **Values** SA: 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz|2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz WCDMA: 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz|3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz LTEAFDD, LTEATDD, MSR: 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz|4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz 5G NR: 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz|98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz Radio Test: 25 kHz, 25 kHz, 25 kHz, 25 kHz, 25 kHz, 25 kHz
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement
Backwards Compatibility SCPI	[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth[:INTegration] [:SENSe]:ACPR:OFFSet[1]|2:LIST:BANDwidth [:SENSe]:ACPR:OFFSet[1]|2:LIST:BWIDth [:SENSe]:MCPower:OFFSet[1]|2:LIST:BANDwidth[:INTegration] [:SENSe]:MCPower:OFFSet[1]|2:LIST:BWIDth[:INTegration]

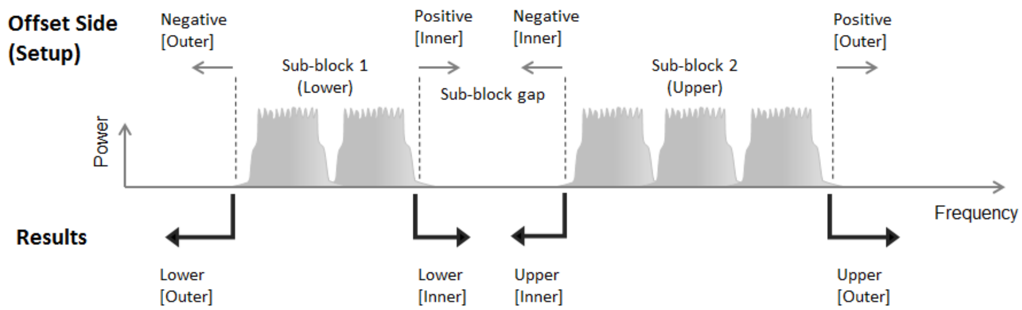
Offset Side

Specifies which offset side to measure.

You can turn off (not use) specific offsets with [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE.

NEGative	Negative (lower) sideband only
BOTH	Both of the negative (lower) and positive (upper) sidebands
POSitive	Positive (upper) sideband only

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in MSR, LTEAFDD and LTEATDD Modes.



Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE NEGative | BOTH | POSitive, …` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE?`
Example	`:ACP:OFFS:LIST:SIDE BOTH` `:ACP:OFFS:LIST:SIDE?`
Notes	`OFFSet1` is for BTS, `2` for MS. Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored If you set `POS` or `NEG` in an offset, result of the inactive side returns -999
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is `BOTH` `BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
State Saved	Saved in instrument state
Range	`NEGative|BOTH|POSitive`

Method

Allows you to turn RRC filtering of each offset on or off. The value (roll off) for the filter will be set to the value of the **Filter Alpha** parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe]?`
Example	`:ACP:OFFS:LIST:FILT 1,0,0` `:ACP:OFFS:LIST:FILT?`
Notes	`1|ON` = RRC Weighted, `0|OFF` = Integ BW Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

	Mode	**Values**
	SA	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0,0
	WCDMA	1, 1, 1, 1, 1, 1 | 1, 1, 1, 1, 1, 1
	LTEAFDD, LTEATDD, 5G NR, MSR	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0,0
	Radio Test	0, 0, 0, 0, 0, 0
State Saved	Saved in instrument state	
Range	Integ BW | RRC Weighted	

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa <real>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa?`
Example	`:ACP:OFFS:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:LIST:FILT:ALPH?`
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Mode	Values
SA	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
WCDMA	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
LTEAFDD, LTEATDD, 5G NR, MSR	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22

State Saved	Saved in instrument state
Min/Max	0.01/1.00

Advanced (Offset)

Opens a further menu page, which lets you set advanced properties of the Inner Offset, such as Res BW, Video BW, and Filter parameters.

Offset Freq

This column is the same as "Offset Freq" on page 1014 in the main **Offset** menu.

Res BW

Sets the resolution bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution <freq>,…</code>
<code>[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution?</code></td></tr>

Video BW

Enables you to change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo?`
Example	`:ACP:OFFS2:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz` `:ACP:OFFS2:LIST:BAND:VID?`
Notes	The values shown in this table reflect the conditions after **Mode Preset** Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "Meas Method" on page 963 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value **Modes**: **Values** SA: 22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz WCDMA: 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz LTEAFDD, LTEATDD, 5G NR, MSR: 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz
State Saved	Saved in instrument state
Min/Max	1 Hz/50 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo`

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO?`
Example	`:ACP:OFFS2:LIST:BAND:VID:AUTO 0,0,0,0,1,1` `:ACP:OFFS2:LIST:BAND:VID:AUTO?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is ON `ON, ON, ON, ON, ON, ON`
State Saved	Yes
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo:AUTO`

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe GAUSsian	FLATtop,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe?`
Example	`:ACP:OFFS2:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS` `:ACP:OFFS2:LIST:BAND:SHAP?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "Res BW" on page 929 Mode for the offset is **Auto**, this cell is grayed out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 963 to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is `GAUSsian GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian`
State Saved	Saved in instrument state
Range	`GAUSsian|FLATtop`
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:SHAPe`

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE DB3	DB6,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE?`
Example	`:ACP:OFFS2:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3` `:ACP:OFFS2:LIST:BAND:TYPE?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When "RBW Filter Type" on page 933 is Flattop, or "Res BW" on page 929 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 963 to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is `DB3`

	DB3, DB3, DB3, DB3, DB3, DB3
State Saved	Saved in instrument state
Range	–3 dB (Normal)| –6 dB
Backwards Compatibility SCPI	[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:TYPE

Limits

Lets you configure the limits that are used to determine whether the offset regions PASS or FAIL the limit test.

Limit Test

This checkbox is the same as "Limit Test" on page 1023 in the **Meas Setup, Settings** tab.

Offset Freq

This column is the same as "Offset Freq" on page 1014 in the **Offset** index tab.

Abs Limit

Specifies an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain 6 entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe command.

The query returns the six (6) sets of real numbers that are the current absolute amplitude test limits.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute < real>,… [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute?
Example	:ACP:OFFS2:LIST:ABS -10,-10,-10,-10,-10,-10 :ACP:OFFS2:LIST:ABS?
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the

	Offset F value **Modes** / **Values** SA: 0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm | 0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm WCDMA: 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm | 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm LTEAFDD, LTEATDD, MSR: -8.45, -8.45, -8.45, -8.45, -8.45, -8.45 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0 5G NR: 4.92, 4.92, 4.92, 4.92, 4.92, 4.92 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0
State Saved	Saved in instrument state
Min/Max	-200.0 dBm/50.0 dBm

Backwards Compatibility SCPI	`[:SENSe]:ACPR:OFFSet[1]|2:LIST:ABSolute`
	SA, W-CDMA
	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:ABSolute`
	SA, W-CDMA

Rel Limit (Car)

Enters a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier <real>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier?`
Example	`:ACP:OFFS2:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:LIST:RCAR?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored

Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0
WCDMA	-44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2

Min/Max	-150.0/50.0
Backwards Compatibility SCPI	:CALCulate:MCPower:OFFSet:LIST:LIMit:POSitive[:UPPer]:DATA (Power Suite)

Negative Offset Limit(Remote Command only)

Enables you to set the upper limit for the lower segment of the specified offset pair.

Remote Command	:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer]:DATA <real>,... :CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer]:DATA?
Example	:CALC:ACP:OFFS:LIST:LIM:NEG:DATA 0,0,0,0,0,0 :CALC:ACP:OFFS:LIST:LIM:NEG:DATA?
Notes	Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-45, -60, 0, 0, 0, 0 | -45, -60, 0, 0, 0, 0
WCDMA	-44.2, -49.2, -49.2, -49.2, -49.2, -49.2 | -32.2, -42.2, -42.2, -42.2, -42.2, -42.2
LTEAFDD, LTEATDD, MSR	-44.2, -44.2, -44.2, -44.2, -44.2, -44.2 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
5G NR	-43.8, -43.8, -43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0/50.0
Backwards Compatibility SCPI	:CALCulate:MCPower:OFFSet:LIST:LIMit:NEGative[:UPPer]:DATA (Power Suite, WCDMA)

Rel Limit (PSD)

Enters a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity <rel_ampl>,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity?`
Example	`:ACP:OFFS2:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:LIST:RPSD?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA	-28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB | -28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB
WCDMA	-44.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB | -32.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB
LTEAFDD, LTEATDD, 5G NR, MSR	0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0, 0
Radio Test	-60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that lets you select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:ABSolute`, or the relative values defined with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RPSDensity and `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RCARrier`.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe`.

Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit**
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***and* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***or* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST ABSolute | AND | OR | RELative,…` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST?`
Example	`:ACP:OFFS2:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:LIST:TEST?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some Modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
SA, WCDMA	`REL, REL, REL, REL, REL, REL | REL, REL, REL, REL, REL, REL`
LTEAFDD, LTEATDD, 5G NR, MSR	`AND, AND, AND, AND, AND, AND | AND, AND, AND, AND, AND, AND`
Radio Test	`REL, REL, REL, REL, REL, REL`

State Saved	Saved in instrument state
Range	`ABSolute|AND|OR|RELative`
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:TEST`

Offset Frequency Define

Allows you to select “Offset” definition:

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW

ETOCenter	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
ETOEdge	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge frequency of each Offset Integ BW
STOCenter	From either the lower or upper sub-block edge frequency to the center frequency of each Offset Integ BW
STOEdge	From either the lower or upper sub-block edge frequency to the closest edge frequency of each Offset Integ BW
SCTOCenter 5G NR only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of "Measure Carrier" for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

See "Diagram for Offset Freq Define" on page 1030

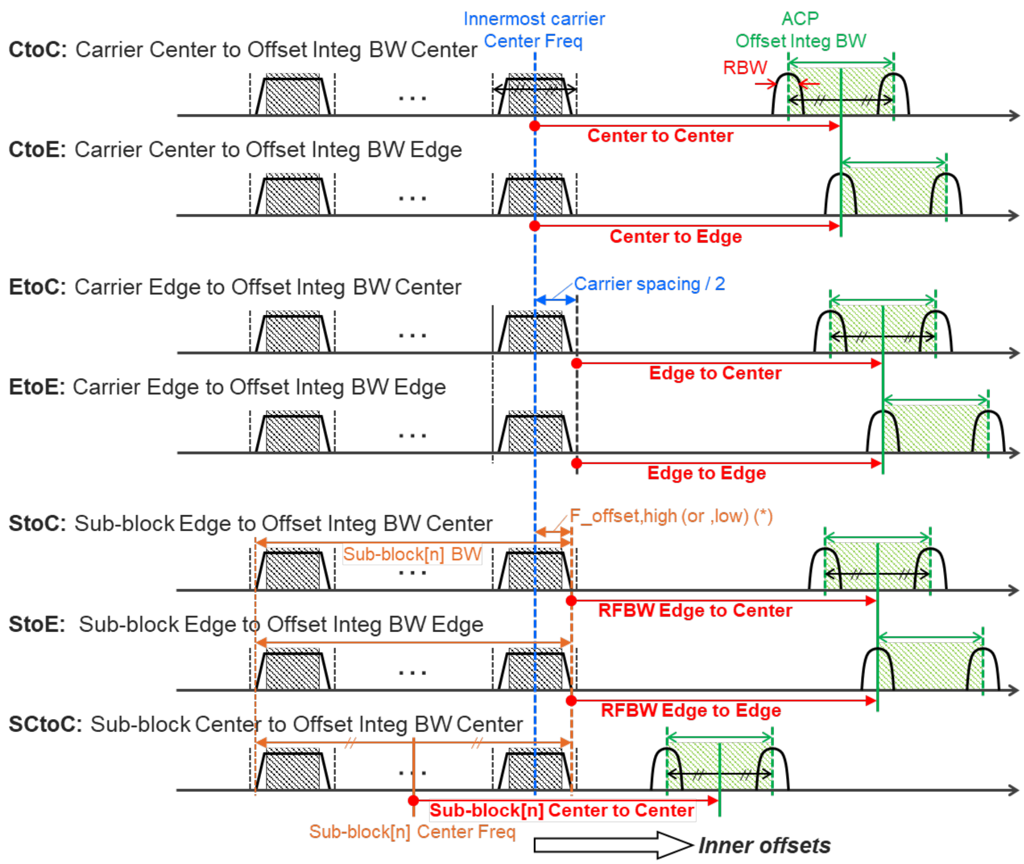
Mode: MSR, LTEAFDD, LTEATDD

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE?`
Example	`:ACP:OFFS:INN:TYPE ETOC` `:ACP:OFFS:INN:TYPE?`
Preset	`STOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter|CTOEdge|ETOCenter|ETOEdge|STOCenter|STOEdge`

Mode: 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge | SCTOCenter` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE?`
Example	`:ACP:OFFS:INN:TYPE ETOC` `:ACP:OFFS:INN:TYPE?`
Preset	`STOCenter | CTOCenter`
State Saved	Saved in instrument state
Range	`CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge | SCTOCenter`

Diagram for Offset Freq Define



Note:

RF BW Edge and Outermost Carrier Edge are not always same.
e.g.) 5G NR (3GPP) defines BW_channel,CA which calculates F_offset,high and F_offset,low asymmetrically with SCS shift

(*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Freq

Determines the frequency difference between the center of the main channel and the center of the carrier. When set to Offset to Edge, this parameter determines the frequency difference between the center of the main channel and the near edge of the offset.

Each **Offset Freq** state value is entered individually by selecting the desired carrier. Use the **Enabled** checkbox to turn the **Offset Freq** State on or off.

The list contains up to 6 entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz, and causes it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST[:FREQuency] <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST[:FREQuency]?`
Example	`:ACP:OFFS1:INN:LIST 0,0,0,0,0,0` `:ACP:OFFS1:INN:LIST?`
Notes	When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, then subsequent values are ignored Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Couplings	Changing Offset Frequency might affect "Span" on page 948
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value
State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

Preset values:

Modes	Values
5G NR	10 MHz, 30 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz | 100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz
All Others	2.5MHz,7.5MHz,0,0,0,0 | 2.5MHz,7.5MHz,0,0,0,0

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe?`
Example	`:ACP:OFFS2:INN:LIST:STAT 1,1,0,0,0,0` `:ACP:OFFS2:INN:LIST:STAT?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value `ON, ON, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF`
State Saved	Yes

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by `[:SENSe]:ACP:OFFSet[n]:INNer:LIST[:FREQuency]`.

Enter each value individually by selecting the desired offset on the **Offset** menu key using the up down arrows, the knob, or the numeric keypad, then enter the Offset Integration Bandwidth using the **Offset Integration Bandwidth** menu key.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth[:INTegration] <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth[:INTegration]?`
Example	`:ACP:OFFS2:INN:LIST:BAND 2MHz,2MHz,2MHz,2MHz,2MHz,2MHz` `:ACP:OFFS2:INN:LIST:BAND?`
Notes	When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, so, if you want to change the second value you must send all values up to it. Subsequent values remain unchanged Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Couplings	Changing Integ BW might affect "Span" on page 948
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

Modes	Values
LTEAFDD	3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz | 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz
MSR, LTEATDD	4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz | 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz
5G NR	19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz | 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz

State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as Max Span of the Swept SA Measurement

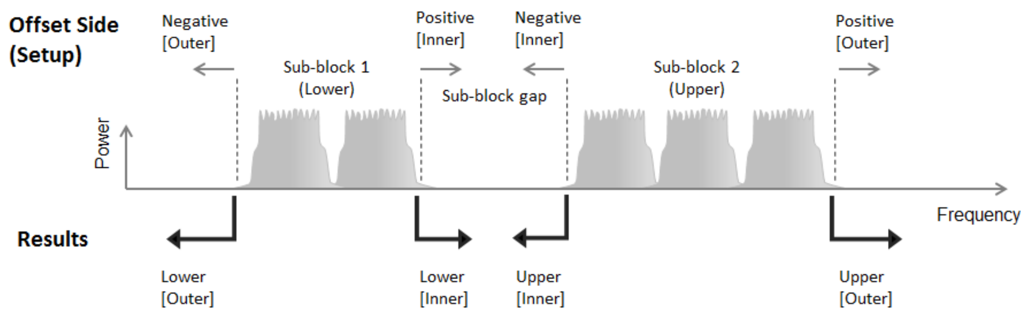
Offset Side

Lets you turn off (not use) specific offsets with `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE`.

- `NEGative` - The upper side in the sub-block gap only (that is, negative sideband of the upper sub-block) is enabled

- BOTH - Both sides in the sub-block gap are enabled
- POSitive - The lower side in the sub-block gap only (that is, positive sideband of the lower sub-block) is enabled

The diagram below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR, LTEAFDD and LTEATDD Modes.



Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE NEGative | BOTH | POSitive, … [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE?
Example	:ACP:OFFS:INN:LIST:SIDE BOTH :ACP:OFFS:INN:LIST:SIDE?
Notes	OFFSet1 is for BTS, 2 for MS. Default is BTS If you set POS or NEG in an offset, result of the inactive side returns -999
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is BOTH BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH
State Saved	Saved in instrument state
Range	NEGative|BOTH|POSitive

Method

Lets you turn RRC filtering of each offset on or off. The value (roll off) for the filter is set to the value of the Filter Alpha parameter.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0,… [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe]?
Example	:ACP:OFFS:INN:LIST:FILT 1,0,0 :ACP:OFFS:INN:LIST:FILT?
Notes	1|ON = RRC Weighted, 0|OFF = Integ BW
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value

	<table><tr><th>Modes</th><th>Values</th></tr><tr><td>LTEAFDD</td><td>1,1,1,1,1,1 | 1,1,1,1,1,1</td></tr><tr><td>MSR, LTEATDD, 5G NR</td><td>0,0,0,0,0,0 | 0,0,0,0,0,0</td></tr></table>
State Saved	Saved in instrument state
Range	Integ BW | RRC Weighted

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa <real>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa?`
Example	`:ACP:OFFS:INN:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:INN:LIST:FILT:ALPH?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 0.22 0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.00

Offset Freq

The same as "Offset Freq" on page 1030 in the main **Inner Offset** menu.

Res BW

Sets the Resolution Bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution?`
Example	`:ACP:OFFS2:INN:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz` `:ACP:OFFS2:INN:LIST:BAND:RES?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Dependencies	When "Meas Method" on page 963 is RBW, FAST or Fast Power, this control is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated
Couplings	When "Res BW" on page 929 Mode is **Auto**, this value is exactly the same as **Res BW**. When you change this value, **Res BW** Mode also changes to **Man**
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 100 kHz

	100 kHz, 100 kHz, 100k Hz, 100 kHz | 100 kHz,100 kHz, 100 kHz,100 kHz, 100 kHz, 100 kHz
State Saved	Saved in instrument state
Min/Max	1 Hz/8 MHz

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO ON | OFF | 1 | 0,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO?`
Example	`:ACP:OFFS2:INN:LIST:BAND:RES:AUTO 1,1,1,1,1,1` `:ACP:OFFS2:INN:LIST:BAND:RES:AUTO?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 1 1, 1, 1, 1, 1, 1
State Saved	Yes

Video BW

Lets you change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo <freq>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo?`
Example	`:ACP:OFFS2:INN:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz` `:ACP:OFFS2:INN:LIST:BAND:VID?`
Notes	The values shown in this table reflect the conditions after **Mode Preset** Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Dependencies	When "Meas Method" on page 963 is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 1 MHz 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz
State Saved	Yes
Min/Max	1 Hz/50 MHz

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO?`
Example	`:ACP:OFFS2:INN:LIST:BAND:VID:AUTO 0,0,0,0,1,1` `:ACP:OFFS2:INN:LIST:BAND:VID:AUTO?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is ON

	ON, ON, ON, ON, ON, ON
State Saved	Yes

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe GAUSsian | FLATtop,… [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe?
Example	:ACP:OFFS2:INN:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS :ACP:OFFS2:INN:LIST:BAND:SHAP?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink)
Dependencies	When "Res BW" on page 929 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 963 to RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is GAUSsian GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian
State Saved	Saved in instrument state
Range	GAUSsian|FLATtop

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE DB3 | DB6,… [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE?
Example	:ACP:OFFS2:INN:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3 :ACP:OFFS2:INN:LIST:BAND:TYPE?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink)
Dependencies	When "RBW Filter Type" on page 933 is FLATtop or "Res BW" on page 929 Mode for the offset is **Auto**, this cell is grayed-out and disabled. Since **Res BW** Mode for the offset is preset to **Auto** on changing "Meas Method" on page 963 to RBW, FAST or Fast Power, this cell is also grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is DB3 DB3, DB3, DB3, DB3, DB3, DB3
State Saved	Saved in instrument state
Range	–3 dB (Normal)| –6 dB

Power Ref Type

Lets you set reference types of inner offsets.

`CUMulative`	Cumulated power of the upper and lower sub-block carriers is the reference level. This selection is effective only when one of the following "Power Ref" on page 1045 values is selected:

Left & Right Carriers	`LRCarriers`
Max Power Carrier in Sub-block	`MPCSubblock`
Min Power Carrier in Sub-block	`MINSubbloc`
Left & Right Sub-blocks	`LRSubblocks`
Manual	`MANual`

When one of the other **Power Ref** values is selected, carrier powers are not cumulated, and the reference level is equivalent to Normal

`NORMal`	Power of specified carrier or the manual reference level is the reference level

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence CUMulative | NORMal, …` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence?`
Example	`:ACP:OFFS:INN:LIST:PREF CUM,CUM,NORM,NORM,NORM,NORM` `:ACP:OFFS:INN:LIST:PREF?`
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is `NORMal` `NORMal, NORMal, NORMal, NORMal, NORMal, NORMal`
State Saved	Saved in instrument state
Range	`CUMulative|NORMal`

Auto Function

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence:AUTO OFF | ON | 0 | 1, …` `[:SENSe]:ACPower:OFFSet[1] | 2:INNer:LIST:PREFerence:AUTO?`
Example	`:ACP:OFFS:INN:LIST:PREF:AUTO OFF,OFF,OFF,OFF,OFF,OFF` `:ACP:OFFS:INN:LIST:PREF:AUTO?`
Dependencies	Available only in LTEAFDD, LTEATDD and 5G NR Modes
Couplings	When in the LTEAFDD, LTEATDD Modes, the inner power ref type is set automatically when the power ref type state is auto according to the scopes of the sub-block gap in the following table

Sub-block Gap	Inner ACP offset	Power Ref Type
Wgap <5MHz	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Normal

Sub-block Gap	Inner ACP offset	Power Ref Type
5MHz≤ Wgap <10MHz	1st (2.5MHz)	Cumulative
	2nd (7.5MHz)	Normal
10MHz≤ Wgap <15MHz	1st (2.5MHz)	Cumulative
	2nd (7.5MHz)	Cumulative
15MHz≤ Wgap <20MHz	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Cumulative
20MHz≤ Wgap	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Normal

When in 5G NR Mode, Power Ref Type “Auto” sets the power reference type of inner-ACLR offset automatically

Downlink: “Cumulative” or “Normal” is selected accordingly when the inner-offsets are configured to meet the test requirements as follows:

FR1, 3GPP TS 38.141-1 v16.5.0 (2020-09) Section 6.6.3.5.3 BS type 1-C:

- Table 6.6.3.5.2-3: Base Station ACLR limit in non-contiguous spectrum or multiple bands
- Table 6.6.3.5.2-4: Base station CACLR limit

FR2, 3GPP TS 38.141-2 v16.5.0 (2020-09) Section 6.7.3.5.3 BS type 2-O:

- Table 6.7.3.5.2-3: BS type 2-O ACLR limit in non-contiguous spectrum
- Table 6.7.3.5.2-4: BS type 2-O CACLR limit in non-contiguous spectrum

Uplink: “Normal” is always selected

Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value `ON, ON, ON, ON, ON, ON | OFF, OFF, OFF, OFF, OFF, OFF`
State Saved	Saved in instrument state
Range	`Auto|Man`

Limit Test

This checkbox is the same as "Limit Test" on page 1023 in the **Settings** tab.

Offset Freq

This column is the same as "Offset Freq" on page 1030 in the **Offset** tab.

Abs Limit

Specifies an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain 6 entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current absolute amplitude test limits.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute < real>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute?`
Example	`:ACP:OFFS2:INN:LIST:ABS -10,-10,-10,-10,-10,-10` `:ACP:OFFS2:INN:LIST:ABS?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value
State Saved	Saved in instrument state
Min/Max	-200.0 dBm/50.0 dBm

Preset values:

Modes	Values
5G NR	-2.2, -2.2, -2.2, -2.2, -2.2, -2.2 | -50.0,-50.0,-50.0,-50.0,-50.0,-50.0
All Others	-8.45,-8.45,-8.45,-8.45,-8.45,-8.45 | -50.0,-50.0,-50.0,-50.0,-50.0,-50.0

Rel Limit (Car)

Specifies a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier <real>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier?`
Example	`:ACP:OFFS2:INN:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:INN:LIST:RCAR?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is the same as the Offset F value **Modes** / **Values** 5G NR: -43.8, -43.8, 43.8, -43.8, -43.8, -43.8 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2 All Others: -44.2, -44.2,-44.2,-44.2,-44.2,-44.2 | -29.2, -29.2, -29.2, -29.2, -29.2, -29.2
State Saved	Saved in instrument state
Min/Max	-150/50.0

Rel Limit (PSD)

Specifies a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains 6 entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

The query returns the 6 sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity <rel_ampl>,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity?`
Example	`:ACP:OFFS2:INN:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:INN:LIST:RPSD?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is 0 0, 0, 0, 0, 0, 0 | 0, 0, 0, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that enables you to select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:ABSolute`, or the relative values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RPSDensity` and `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RCARrier`.

You can turn off (not use) specific offsets with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe`.

Option	SCPI	Description
Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *and* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *or* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST ABSolute | AND | OR | RELative,…` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST?`
Example	`:ACP:OFFS2:INN:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:INN:LIST:TEST?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	When "Max Num of Offsets" on page 1000 is 12, the preset value of Offset G ~ L is `AND` `AND, AND, AND, AND, AND, AND | AND, AND, AND, AND, AND, AND`
State Saved	Saved in instrument state
Range	`ABSolute|AND|OR|RELative`

Reference Carrier (Carrier Index)

Sets the reference carrier. Relative power measurements are made from the reference carrier.

If set to **Auto**, the measurement selects the carrier with the highest power as the reference carrier and the Ref Carrier parameter is updated. If a value is entered when Ref Carrier Mode is set to **Auto**, the mode changes to **Man**.

If set to **Man**, the value that you enter for the Ref Carrier is used as the reference carrier.

In MSR, LTEAFDD, LTEATDD and 5G NR Modes, this control is called **Carrier Index** and has a different SCPI command. In these Modes, it sets the carrier index of the reference power. The power of the carrier selected by this index becomes reference power when "Power Ref" on page 1045 is **Carrier Index**. Any value up to the MAX can be set, though the measurement only deals with number of carriers specified by Carrier. If the index is larger than Carrier, reference power in this measurement becomes `NaN` and therefore all relative power results are `NaN`.

For more information, see "Carrier Index (Modes: MSR, LTEAFDD, LTEATDD, and 5GNR)" on page 1043.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier <integer>` `[:SENSe]:ACPower:CARRier[1]|2:RCARrier?`
Example	`:ACP:CARR:RCAR 1` `:ACP:CARR:RCAR?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored For LTEAFDD and LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Dependencies	Grayed-out if there is only one carrier Does not appear in MSR, LTEAFDD, LTEATDD and 5G NR Modes
Couplings	If you enter a carrier value that is currently configured as having no power present, that carrier changes to having power present
Preset	Auto determined
State Saved	Saved in instrument state
Min/Max	1/Number of available carriers
Backwards Compatibility SCPI	`[:SENSe]:MCPower:RCARrier[1]|2`

Auto Function

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier:AUTO OFF | ON | 0 | 1` `[:SENSe]:ACPower:CARRier[1]|2:RCARrier:AUTO?`
Example	`:ACP:CARR:RCAR:AUTO OFF` `:ACP:CARR:RCAR:AUTO?`

Couplings	If you enter a ref carrier this parameter will be set to manual
Preset	1
State Saved	Yes
Range	Auto | Man
Backwards Compatibility SCPI	`[:SENSe]:MCPower:RCARrier[1]|2:AUTO` (Power Suite)

Carrier Index (Modes: MSR, LTEAFDD, LTEATDD, and 5GNR)

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:INDex <integer>` `[:SENSe]:ACPower:CARRier[1]|2:INDex?`
Example	`:ACP:CARR:IND 1` `:ACP:CARR:IND?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	Only appears in MSR, LTEAFDD, LTEATDD and 5G NR Modes
Preset	1
State Saved	Saved in instrument state
Min/Max	LTEAFDD, LTEATDD: 1/Dependent on Num Component Carriers 5G NR: 1/Dependent on Num Component Carriers MSR: 1/100

Carrier Index Zero Base (Remote Command Only)

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier:ZBASe <integer>` `[:SENSe]:ACPower:CARRier[1]|2:RCARrier:ZBASe?`
Example	`:ACP:CARR:RCAR:ZBAS 1` `:ACP:CARR:RCAR:ZBAS?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	Not available in multicarrier applications (MSR, 5GNR, LTE Modes)
Couplings	Coupled with: `[:SENSe]:ACPower:CARRier[1]|2:RCARrier <integer>`
Preset	0

State Saved	Saved in instrument state
Min	0
Max	9

Ref Carrier Freq

Sets the reference carrier frequency.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:RCFRequency <freq>` `[:SENSe]:ACPower:CARRier[1]|2:RCFRequency?`
Example	`:ACP:CARR:RCFR 250 MHz` `:ACP:CARR:RCFR?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored For LTEAFDD and LTEATDD Modes, this control is not shown. In order to maintain backwards compatibility with legacy LTE FDD/TDD Modes, the SCPI command is supported in the LTE & LTE-A converged applications
Dependencies	Does not appear in MSR, LTEAFDD, LTEATDD and 5G NR Modes
Couplings	LTEAFDD and LTEATDD Modes do not support the following couplings Coupled to **Center Frequency** If the center frequency changes, **Ref Carrier Freq** is calculated using the following three steps; 1. Ref Freq1 = Ctr Freq - (Total of all Carrier Widths / 2) 2. Ref Freq2 = Ref Freq1 + (Total of all Carrier Widths up to Ref Carrier) 3. Ref Freq = Ref Freq2 + (0.5 * Carrier Width of Ref Carrier) If **Ref Carrier Freq** changes, **Center Frequency** is calculated using the following three steps; 1. Ctr Freq1 = Ref Freq - (0.5 * Carrier Width of Ref Carrier) 2. Ctr Freq2 = Ctr Freq1 - (Total of all Carrier Widths up to Ref Carrier) 3. Ctr Freq = Ctr Freq2 + (Total of all Carrier Widths / 2) This ensures that the carriers are always centered on the screen If there is only one carrier present, **Ref Carrier Freq** is the same as **Center Frequency**
Preset	Calculated based on the current **Center Frequency**
State Saved	Saved in instrument state
Min/Max	-79.999995 MHz/Hardware Dependent:
Backwards Compatibility SCPI	`[:SENSe]:MCPower:RCFRequency[1]|2 (Power Suite)`

Auto Function

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:RCFRequency:AUTO OFF | ON | 0 | 1 [:SENSe]:ACPower:CARRier[1]|2:RCFRequency:AUTO?
Example	:ACP:CARR:RCFR:AUTO OFF :ACP:CARR:RCFR:AUTO?
Preset	ON
State Saved	Yes
Range	Auto | Man
Backwards Compatibility SCPI	[:SENSe]:MCPower:RCFRequency[1]|2:AUTO

Measurement Type

Changes the reference used for the measurement. This allows you to make absolute and relative power measurements of either total power or the power normalized to the measurement bandwidth.

- Total Pwr Ref (TPRef) sets the reference to the total carrier power
- PSD Ref (PSDRef) sets the reference to the power spectral density of the carrier

Remote Command	[:SENSe]:ACPower:TYPE TPRef | PSDRef [:SENSe]:ACPower:TYPE?
Example	:ACP:TYPE PSDR :ACP:TYPE?
Preset	TPRef
State Saved	Saved in instrument state
Range	Total Power Ref | PSD Ref

Power Ref

Selects the power reference type. This control has two different forms, depending on the currently-selected Mode:

- "Power Ref (Modes: SA, WCDMA, VMA, SRComms)" on page 1046
- "Power Ref (Modes: LTEAFDD, LTEATDD, 5G NR, MSR)" on page 1046

Power Ref (Modes: SA, WCDMA, VMA, SRComms)

Type	Option	Description
Ref Carrier	RCARrier	Power of the specified carrier is the reference of measurement. Use the Reference Carrier control to select Carrier Index
Manual Power	MANual	Power or PSD specified by the user is the reference of measurement
Total Multicarriers	TMCarriers	Total Power of multi carriers is the power reference of measurement. Each carrier power is calculated with its own carrier configuration settings

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE RCARrier | MANual | TMCarriers` `[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE?`
Example	`:ACP:CARR:PREF:TYPE RCARrier` `:ACP:CARR:PREF:TYPE?`
Notes	Available only in SA, WCDMA, VMA and Short-Range Comms Modes Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Preset	RCARrier
State Saved	Saved in instrument state
Range	RCARrier|MANual|TMCarriers

Power Ref (Modes: LTEAFDD, LTEATDD, 5G NR, MSR)

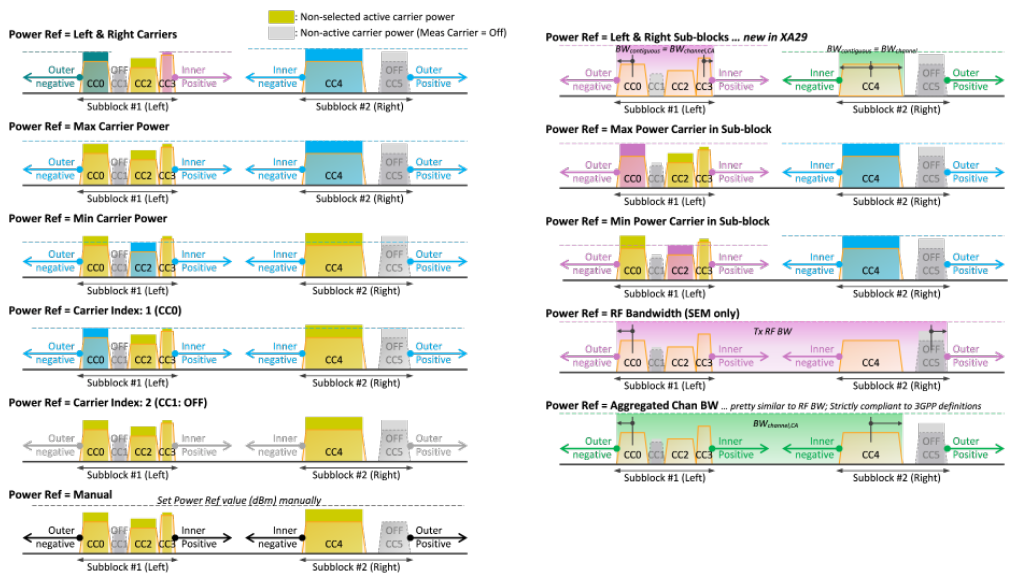
Selects the power reference type:

Type	Option	Description
Left & Right Carriers	LRCarriers	Powers of leftmost and rightmost carriers with Measure Carrier On in a sub-block are the references of left and right sides respectively. Left and right carriers are determined based on the carrier center frequencies. If Measure Carriers of all the carriers in a sub-block are off, the reference power in a sub-block and all the relative power results are NaN. Relative limits are not evaluated
Max Power Carrier	MPCarrier	Maximum carrier power among the carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers are off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Min Power Carrier 5G NR only	MINPcarrier	Minimum carrier power among the carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers are off, the reference power and all the relative power results are NAN. Relative limits are not evaluated

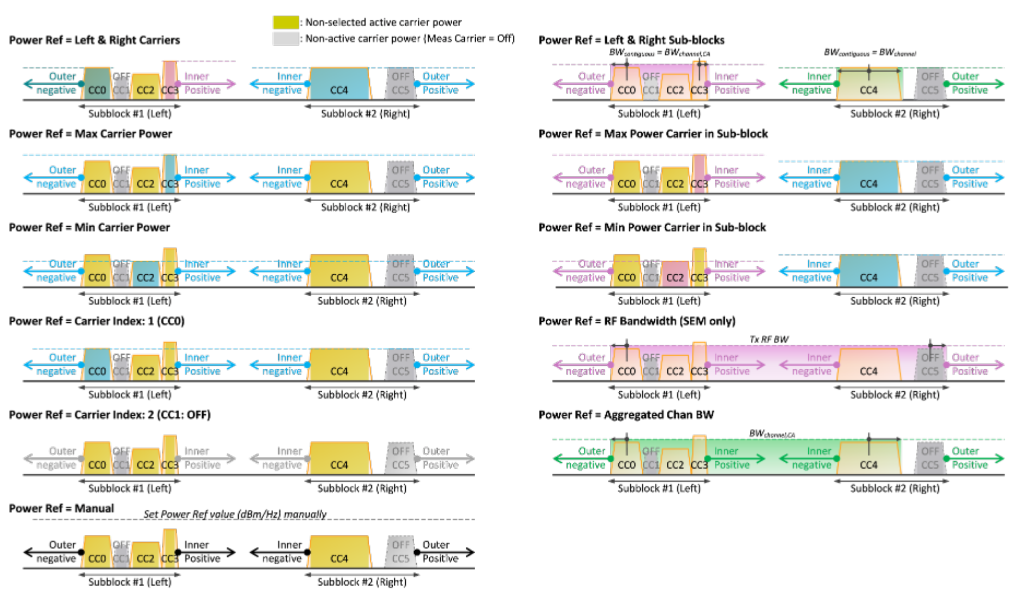
Type	Option	Description
Carrier Index	CINDex	Power of the specified carrier is the reference of measurement. If Measure Carriers of this carrier index is off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Manual	MANual	Power or PSD specified by the user is the reference of measurement
Aggregated Chan BW LTEAFDD, LTEATDD, 5G NR only	ACBandwidth	The assigned aggregated channel bandwidth power which is measured with a rectangular filter with measurement bandwidth specified as aggregated channel bandwidth based on the definition of each 3GPP standard. Calculated from the carrier configuration including SCS (Power Meas), the smallest SCS among the enabled SCSs of the selected component carrier. If Measure Carriers of all the carriers are off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Max Power Carrier in Sub-block	MPCSubblock	Maximum carrier power among the sub-block carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers in a sub-block are off, the reference power of the sub-block and all the relative power results referring to this sub-block are NAN, and these relative limits are not evaluated
Total Multicarriers MSR only	TMCarriers	Total power of multi carriers is the power reference of measurement. Each carrier power is calculated with its own carrier configuration settings
Min Power Carrier in Sub-block 5G NR only	MINSubbloc	Minimum carrier power among the sub-block carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers in a sub-block are off, the reference power of the sub-block and all the relative power results referring to this sub-block are NAN, and these relative limits are not evaluated
Left & Right Sub-blocks 5G NR only	LRSubblocks	The reference depends on the number of Component Carriers (CC) and Carrier Allocation as follows: – Num of CC is 1: the carrier power is the reference – Num of CC is 2 or more & Carrier Allocation is Contiguous: Aggregated Channel power is the reference – Num of CC is 2 or more & Carrier Allocation is Non-Contiguous: Aggregated powers of left and right sub-blocks are the references. Left and right sub-blocks are determined by component carrier configuration

The powers of carriers are not included in the reference power when their Measure Carriers are Off. When Measure Carriers of all the carriers in a sub-block are Off, the reference power and all the relative power results are NaN. Therefore, relative limits are not evaluated.

Measurement Type = Total Power Ref



Measurement Type = PSD Ref



Remote	`[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE LRCarriers | MPCarrier | CINDex`

Command	| MANual | MPCSubblock | ACBandwidth | TMCarriers | MINPcarrier | MINSubblock | LRSubblocks [:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE?
Example	:ACP:CARR:PREF:TYPE CIND :ACP:CARR:PREF:TYPE?
Notes	Available only in MSR, LTEAFDD, LTEATDD and 5G NR Modes ACBandwidth is available only in LTEAFDD, LTEATDD and 5G NR Modes TMCarriers is available only in MSR Mode MINPcarrier,MINSubblock, and LRSubblocks are available only in 5G NR Mode Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Preset	MPCarrier
State Saved	Saved in instrument state

Power Ref State (Remote Command Only)

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe] OFF | ON | 0 | 1 [:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe]?
Example	:ACP:CARR:AUTO OFF :ACP:CARR:AUTO?
Preset	ON
State Saved	Saved in instrument state
Range	Auto | Man
Backwards Compatibility SCPI	[:SENSe]:MCPower:CARRier[1]|2:AUTO[:STATe]

Total Power Ref

Sets manual total power reference.

This control has two different forms, depending on the currently-selected Mode:

- "Total Power Ref (Modes: SA, WCDMA, VMA, SRComms)" on page 1050
- "Total Power Ref (Modes: LTEAFDD, LTEATDD, 5G NR, MSR)" on page 1050

Total Power Ref (Modes: SA, WCDMA, VMA, SRComms)

This is used when Power Ref is Manual and "Measurement Type" on page 1045 is Total Power.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2[:POWer] <real>` `[:SENSe]:ACPower:CARRier[1]|2[:POWer]?`
Example	`:ACP:CARR 10` `:ACP:CARR?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored The Unit Terminators differ depending on whether or not the mode supports Y Axis Unit and also which Y Axis Unit is selected
Dependencies	Available only when **Measurement Type** is `TPRef`, otherwise grayed-out
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-200 dBm/200 dBm
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2[:POWer]`

Total Power Ref (Modes: LTEAFDD, LTEATDD, 5G NR, MSR)

Sets the multi-carrier power reference. This is used when Power Ref is Manual and "Measurement Type" on page 1045 is Total Power.

When set to **Auto**, the carrier power result reflects the measured power value in the selected reference carrier.

When set to **Man**, the result is referenced to the last measured value, or you may specify the reference for the multi-carrier power measurement. Relative values are displayed, referenced to the “Power Reference” value.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2[:POWer] <real>` `[:SENSe]:ACPower:CARRier[1]|2[:POWer]?`
Example	`:ACP:CARR 10` `:ACP:CARR?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement

	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored The Unit Terminators differ depending on whether or not the mode supports Y Axis Unit and also which Y Axis Unit is selected
Dependencies	Enabled when "Measurement Type" on page 1045 is Total Power and "Power Ref" on page 1045 is Manual
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-200 dBm/200 dBm
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2[:POWer]`

PSD Ref

Sets manual PSD reference.

This control has two different forms, depending on the currently-selected Mode:

- "PSD Ref (Modes: SA, WCDMA, VMA, SRComms)" on page 1051
- "PSD Ref (Modes: LTEAFDD, LTEATDD, 5GNR, MSR)" on page 1052

PSD Ref (Modes: SA, WCDMA, VMA, SRComms)

This is used when "Power Ref" on page 1045 is Manual and "Measurement Type" on page 1045 is PSD.

Sets the power spectral density in the carrier (main channel) that is used to compute the relative power spectral density values for the offsets when **Measurement Type** is PSD Ref.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:CPSD <real>` `[:SENSe]:ACPower:CARRier[1]|2:CPSD?`
Example	`:ACP:CARR:CPSD 25` `:ACP:CARR:CPSD?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	Available only when Measurement Type is `PSDRef`, otherwise grayed-out

Couplings	The value of PSD Ref is automatically converted when PSD Unit is changed
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-999/999

Power Ref State (Backwards Compatibility SCPI)

Sets the Power Reference State to auto or manual.

Example	`:ACP:CARR:AUTO OFF`
	`:ACP:CARR:AUTO?`
	`:MCP:CARR:AUTO ON`
	`:MCP:CARR:AUTO?`

Notes	For backwards compatibility with legacy SA and WCDMA, this command is supported When `ON`, corresponds to the Ref Carrier of the "Power Ref" on page 1045 selection When `OFF`, corresponds to the Manual of the **Power Ref** selection
Preset	`ON`
State Saved	Saved in instrument state
Range	`Auto|Man`

Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe]?`
	`[:SENSe]:MCPower:CARRier[1]|2:AUTO[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:MCPower:CARRier[1]|2:AUTO[:STATe]?`

PSD Ref (Modes: LTEAFDD, LTEATDD, 5GNR, MSR)

Sets manual PSD reference. This is used when "Power Ref" on page 1045 is **Manual** and "Measurement Type" on page 1045 is **PSD**.

Sets the power spectral density in the carrier (main channel) that is used to compute the relative power spectral density values for the offsets when **Measurement Type** is set to **PSD Ref**. When the **PSD Ref** state is set to **Auto**, this will be set to the measured carrier power spectral density.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:CPSD <real>` `[:SENSe]:ACPower:CARRier[1]|2:CPSD?`
Example	`:ACP:CARR:CPSD 25` `:ACP:CARR:CPSD?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after

	measurement Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	Enabled when "Measurement Type" on page 1045 is PSD Reference and **Power Ref** is Manual
Couplings	The value of PSD is automatically converted when PSD Unit is changed
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-999/999

PSD Unit

Sets the unit bandwidth for Power Spectral Density. The available units are dBm/Hz (DBMHZ) and dBm/MHz (DBMMHZ).

Remote Command	`:UNIT:ACPower:POWer:PSD DBMHZ | DBMMHZ` `:UNIT:ACPower:POWer:PSD?`
Example	`:UNIT:ACP:POW:PSD DBMMHZ` `:UNIT:ACP:POW:PSD?`
Dependencies	Enabled when "Measurement Type" on page 1045 is PSD Reference
Couplings	When the PSD unit is changed, the PSD reference result of `:MEAS|READ|FETCH:ACP[n]?` is also changed by the PSD unit basis (in either dBm/Hz or dBm/MHz)
Preset	DBMHZ
State Saved	Saved in instrument state
Range	dBm/Hz | dBm/MHz

3.5.13.3 Meas Standard

Contains controls that allow you to preset the PowerSuite measurements to conform to various communications standards.

Radio Standard Presets

Lets you specify the Radio Standard to be used. Spectrum Analyzer Mode supports many Radio Standards. You can select the desired Radio Standard using the **Radio Std Presets** dialog, which is a cascading list of standards. When you have the selected the desired Standard, press **OK** and the measurement settings will change to reflect that standard.

Remote Command	`[:SENSe]:RADio:STANdard[:SELect] NONE | JSTD | IS95a | IS97D | IS98D | GSM`

	| W3GPP | C2000MC1 | C20001X | NADC | PDC | BLUEtooth | TETRa | WL802DOT11A | WL802DOT11B | WL802DOT11G | HIPERLAN2 | DVBTLSN | DVBTGPN | DVBTIPN | FCC15 | SDMBSE | UWBINDOOR | LTEB1M4 | LTEB3M | LTEB5M | LTEB10M | LTEB15M | LTEB20M | WL11N20M | WL11N40M | WL11AC20M | WL11AC40M | WL11AC80M | WL11AC160M | WL11AX20M | WL11AX40M | WL11AX80M | WL11AX160M | WL11BE20M | WL11BE40M | WL11BE80M | WL11BE160M | WL11BE320M | WL11AD2G | WL11AY2G16 | WL11AY4G32 | WL11AY6G48 | WL11AY8G64 | NR5GFR1B100M [:SENSe]:RADio:STANdard[:SELect]?
Example	:RAD:STAN NONE :RAD:STAN?
Dependencies	Some selections appear only when support license is valid
Couplings	By changing the radio standard, the measurement parameters will be automatically set to an appropriate default value
State Saved	Saved in instrument state

The **Radio** column in the table lets you specify the device to be used. It is a global setting that affects the Device selection, between Mobile (MS) and Base Station (BTS) settings, for all relevant PowerSuite measurements. The Device SCPI command has the same effect as a selection in the **Radio** column:

Remote Command	[:SENSe]:RADio:STANdard:DEVice BTS | MS [:SENSe]:RADio:STANdard:DEVice?
Example	:RAD:STAN:DEV MS :RAD:STAN:DEV?
Preset	BTS
State Saved	Saved in instrument state
Range	BTS|MS

Chart for Standard and Available Measurements

Note that not every measurement in Spectrum Analyzer Mode is available for every standard. The chart below describes which measurements are available for each Radio Standard.

For TOI or Harmonics measurements, *no* Radio Standards are available.

	Swept SA	CHP	OBW	ACP	CCDF	Burst Power	Spurious Emission	SEM	List Sweep

General Radio Standards

The table below lists the settings and provides an example for each general Radio Standard.

None	Command Example	:RAD:STAN NONE
	IBW	2 MHz
	Span	3 MHz
	RBW	Auto rules
	VBW	Auto rules
TETRA	Command Example	:RAD:STAN TETR
	IBW	18 kHz
	Span	27 kHz
	RBW	1.2 kHz
	VBW	Auto rules
	RRC Filter	On
	RRC Filter Alpha	0.35
FCC Part15 Subpart F	Command Example	:RAD:STAN FCC15

Video Radio Standards

The table below lists the settings and provides an example for each video Radio Standard.

DVB-T L/SECAM/NICAM	Command Example	:RAD:STAN DVBTLSN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
DVB-T G/PAL/NICAM	Command Example	:RAD:STAN DVBTGPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001

DVB-T I/PAL/NICAM	Command Example	:RAD:STAN DVBTIPN
	IBW	7.61 MHz
	Span	24 MHz
	RBW	3.9 kHz
	VBW	Auto rules
	Sweep Points	8001
S-DMB System E	Command Example	:RAD:STAN SDMBSE
	IBW	25 MHz
	Span	37.5 MHz
	RBW	360 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22

Cellular Radio Standards

The table below lists the CHP settings and provides an example for each cellular Radio Standard.

GSM/EDGE	Command Example	:RAD:STAN GSM
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP W-CDMA	Command Example	:RAD:STAN W3GPP
	IBW	5 MHz
	Span	7.5 MHz
	RBW	240 kHz
	VBW	Auto rules
	RRC Filter	Off
	RRC Filter Alpha	0.22
3GPP LTE 1.4 MHz	Command Example	:RAD:STAN LTEB1M4
	IBW	1.4 MHz
	Span	2.1 MHz
	RBW	Auto rules
	VBW	Auto rules

3GPP LTE 3 MHz	Command Example	:RAD:STAN LTEB3M
	IBW	3 MHz
	Span	4.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 5 MHz	Command Example	:RAD:STAN LTEB5M
	IBW	5 MHz
	Span	7.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 10 MHz	Command Example	:RAD:STAN LTEB10M
	IBW	10 MHz
	Span	15 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 15 MHz	Command Example	:RAD:STAN LTEB15M
	IBW	15 MHz
	Span	22.5 MHz
	RBW	Auto rules
	VBW	Auto rules
3GPP LTE 20 MHz	Command Example	:RAD:STAN LTEB20M
	IBW	20 MHz
	Span	30 MHz
	RBW	Auto rules
	VBW	Auto rules
cdma2000	Command Example	:RAD:STAN C20001X :RAD:STAN C2000MC1 :RAD:STAN? (Query always returns C20001X)
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules

IS-95A	Command Example	:RAD:STAN IS95
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
J-STD-008	Command Example	:RAD:STAN JSTD
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24 kHz
	VBW	Auto rules
NADC	Command Example	:RAD:STAN NADC
	IBW	32.8 kHz
	Span	49.2 kHz
	RBW	1.2 kHz
	VBW	Auto rules
PDC	Command Example	:RAD:STAN PDC
	IBW	21 kHz
	Span	31.5 kHz
	RBW	6.2 kHz
	VBW	Auto rules
IS-97D/98D	Command Example	:RAD:STAN IS97D :RAD:STAN IS98D :RAD:STAN IS95C :RAD:STAN? Query always returns `IS97D`
	IBW	1.23 MHz
	Span	1.845 MHz
	RBW	24kHz
	VBW	Auto rules

Band Class (IS-97D/98D only)

The following function is only available when you have selected the standard: IS-97D/98D. It lets you select the band class.

Remote Command	`[:SENSe]:RADio:STANdard:BAND:CLASs BC0 | BC1` `[:SENSe]:RADio:STANdard:BAND:CLASs?`
Example	`:RAD:STAN:BAND:CLAS BC0` `:RAD:STAN:BAND:CLAS?`

Preset	BC0
State Saved	Saved in instrument state
Range	0 (800 MHz Band)|1 (1900 MHz Band)

Wireless Radio Standards

The table below lists the CHP settings and provides an example for each wireless Radio Standard.

WLAN 802.11a	Command Example	:RAD:STAN WL802DOT11A
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11g	Command Example	:RAD:STAN WL802DOT11G
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11b	Command Example	:RAD:STAN WL802DOT11B
	IBW	25 MHz
	Span	37.5 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11n 20 MHz	Command Example	:RAD:STAN WL11N20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11n 40 MHz	Command Example	:RAD:STAN WL11N40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules

WLAN 802.11ac 20 MHz	Command Example	:RAD:STAN WL11AC20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 40 MHz	Command Example	:RAD:STAN WL11AC40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 80 MHz	Command Example	:RAD:STAN WL11AC80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ac 160 MHz	Command Example	:RAD:STAN WL11AC160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 20 MHz	Command Example	:RAD:STAN WL11AX20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 40 MHz	Command Example	:RAD:STAN WL11AX40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ax 80 MHz	Command Example	:RAD:STAN WL11AX80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules

WLAN 802.11ax 160 MHz	Command Example	:RAD:STAN WL11AX160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 20 MHz	Command Example	:RAD:STAN WL11BE20M
	IBW	20 MHz
	Span	30 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 40 MHz	Command Example	:RAD:STAN WL11BE40M
	IBW	40 MHz
	Span	60 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 80 MHz	Command Example	:RAD:STAN WL11BE80M
	IBW	80 MHz
	Span	120 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 160 MHz	Command Example	:RAD:STAN WL11BE160M
	IBW	160 MHz
	Span	240 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11be 320 MHz	Command Example	:RAD:STAN WL11BE320M
	IBW	320 MHz
	Span	480 MHz
	RBW	100 kHz
	VBW	Auto rules
WLAN 802.11ad 2 GHz	Command Example	:RAD:STAN WL11AD2G
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules

WLAN 802.11ay 2.16 GHz	Command Example	:RAD:STAN WL11AY2G16
	IBW	2.16 GHz
	Span	3.24 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 4.32 GHz	Command Example	:RAD:STAN WL11AY4G32
	IBW	4.32 GHz
	Span	6.48 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 6.48 GHz	Command Example	:RAD:STAN WL11AY6G48
	IBW	6.48 GHz
	Span	9.72 GHz
	RBW	1 MHz
	VBW	Auto rules
WLAN 802.11ay 8.64 GHz	Command Example	:RAD:STAN WL11AY8G64
	IBW	8.64 GHz
	Span	12.96 GHz
	RBW	1 MHz
	VBW	Auto rules
3GPP 5G NR	Command Example	:RAD:STAN NR5GFR1B100M
5G NR FR1 100MHz	IBW	100 MHz
	Span	150 MHz
	RBW	Auto rules
	VBW	Auto rules

WLAN HiperLAN/2	Command Example	`:RAD:STAN HIPERLAN2`
	UWB Indoor	Command Example RAD:STAN UWBINDOOR
	Bluetooth	Command Example RAD:STAN BLUE

Packet Type (Bluetooth only)

The command below sets the packet type for the Bluetooth measurement

Remote Command	`[:SENSe]:RADio:STANdard:PACKet DH1 | DH3 | DH5` `[:SENSe]:RADio:STANdard:PACKet?`
Example	`:RAD:STAN:PACK DH1` `:RAD:STAN:PACK?`
Notes	The packet length is: DH1 366 µs

	DH3	1622 µs
	DH5	2870 µs
Preset	DH1	
State Saved	Saved in instrument state	
Range	DH1 | DH3 | DH5

Each Radio Standard has the preset parameter set for the measurement.

When a standard is selected, the default value of the measurement parameters are overwritten by those preset values.

When the standard is `NONE`, or the standard does not specify the firm RBW requirement, then the table displays “auto”, and the following definition is used to compute the proper RBW setting:

1. Compute the guard-band = [Offset Freq A] - 0.5*([Chan Integ BW] + [Ref BW])
2. Divide by 4.5. Call the result GuardbandGoalRBW

3. Compute the greater of the Reference and Offset A integration bandwidths. Divide that result by 100 and call it the ChannelWidthGoalRBW
4. Find the smallest integration bandwidth of any of the offsets; divide it by two and call the result IntegBWGoalRBW
5. Compute AutoRBWGoal = min(IntegBWGoal, max(GuardbandGoalRBW, ChannelWidthGoalRBW))
6. Compute the RBW to be selected to be the largest available RBW that is smaller than AutoRBWGoal

Measurements that are unavailable for a particular Radio Standard are grayed-out. Radio Standards that are unavailable for the current active measurement are also grayed-out.

However, remote operations, such as `:CONF` allow the measurement to be active even if it is not a supported format. In this case, the measurement configuration should be set to `NONE`.

Enable Non-Std Meas

Lets you specify whether all measurements and radio standards are enabled or not.

By default, **Enable Non-Std Measurements** is set to `NO`, so you can select only valid combinations of preset available standards and measurements. Combinations of measurement and standard that would have no valid preset value are grayed-out.

When **Enable Non-Std Measurements** is set to `YES`, all measurements and standard selections are enabled, so you can select any combination.

NOTE **If you select an unavailable measurement or unavailable radio standard using the Enable Non-Std Meas control, the measurement results may not conform to the selected standard.**

Remote Command	`[:SENSe]:RADio:STANdard:EAMeas YES | NO` `[:SENSe]:RADio:STANdard:EAMeas?`
Example	`:RAD:STAN:EAM YES` `:RAD:STAN:EAM?`
Preset	`NO`
State Saved	Saved in instrument state
Range	`YES|NO`

3.5.13.4 Advanced

Contains controls for setting advanced functions of the instrument.

This tab does *not* appear in the following instruments:

- EXM
- VXT model M9420A

Phase Noise Opt

Selects the LO (local oscillator) phase noise behavior for various operating conditions.

Remote Command	`[:SENSe]:ACPower:FREQuency:SYNThesis[:STATe] 1 | … | 5`
	For the meaning of each numeric option value, see "Parameter Options, Installed Options, Auto Rules & Ranges" on page 1069 below
	`[:SENSe]:ACPower:FREQuency:SYNThesis[:STATe]?`

Example	`:ACP:FREQ:SYNT 1` `:ACP:FREQ:SYNT?`
Dependencies	Does not appear in all models. For models that do not display this control, the SCPI command is accepted for compatibility (although no action is taken) Not available in VXT models M9410A/11A/15A
Preset	Because this function is in **Auto** after preset, the state of this function after **Preset** will be automatically calculated
State Saved	Saved in instrument state
Range	See "Ranges" on page 1074 below

Auto Function

Remote Command	`[:SENSe]:ACPower:FREQuency:SYNThesis:AUTO[:STATe] OFF | ON | 0 | 1` `[:SENSe]:ACPower:FREQuency:SYNThesis:AUTO[:STATe]?`
Example	`:ACP:FREQ:SYNT:AUTO 1` `:ACP:FREQ:SYNT:AUTO?`
Preset	ON

Parameter Options, Installed Options, Auto Rules & Ranges

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 1071	1	– In instruments with EP0, balances close-in phase noise with spur avoidance – In instruments without EP0 optimizes phase noise for small frequency offsets from the carrier
"Best Wide-offset" on page 1071	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 1072	3	Optimizes LO for tuning speed
"Best Close-in" on page 1070	4 or 1*	– In instruments with EP0, emphasizes close-in phase noise performance without regard to spur avoidance – In instruments without EP0, this setting is accepted but no action is taken
"Best Spurs" on page 1071	5	– In instruments with EP0, emphasizes spur avoidance over close-in phase noise performance – In instruments without EP0, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EP0 installation. See "Best Close-in" on page 1070 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 1072 is identical in effect to "Best Close-in" on page 1070.

Best Close-in

Without option EP0

```
:FREQ:SYNT 1
```

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EP0

```
:FREQ:SYNT 4
```

In instruments with Option EP0, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 1071 setting, parameter 1 selects "Balanced" on page 1071 in EP0 instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 1070, which is usually not as good a choice as "Balanced" on page 1071.

Balanced

```
:FREQ:SYNT 1
```

In instruments with EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Best Spurs

```
:FREQ:SYNT 5
```

In instruments with EP0, the LO is configured for better phase noise than the "Best Wide-offset" on page 1071 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 1070 case mostly within ±1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 1071 case at better than –90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

```
:FREQ:SYNT 2
```

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "Fast Tuning" on page 1072 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "Best Spurs" on page 1071. It is available with the "Fast Tuning" on page 1072 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "Fast Tuning" on page 1072 option, the settings for "Best Close-in" on page 1070 are used if "Fast Tuning" on page 1072 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

`:FREQ:SYNT:AUTO ON`

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EP0 Models with option EP0 have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz	"Balanced" on page 1071
	Span > 114.1 MHz, *or* RBW > 800 kHz	"Fast Tuning" on page 1072
	RBW > 290 kHz, *or* Span > 4.2 MHz	"Best Wide-offset" on page 1071
	Other conditions	"Balanced" on page 1071

Models with Option	Conditions	Selection
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, *or* RBW > 1.9 MHz, *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 1072
	Center frequency is < 195 kHz, *or* CF >= 1 MHz *and* Span <= 1.3 MHz *and* RBW <= 75 kHz	"Best Close-in" on page 1070
	All other conditions	"Best Wide-offset" on page 1071
EP2 Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 1070; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	CF < 130 kHz , *or* CF > 12 MHz *and* Span < 495 kHz *and* RBW < 40 kHz	"Best Close-in" on page 1070
	Span > 22 MHz, *or* RBW > 400 kHz, *or* CF ≤ 12 MHz *and* Span < 495 kHz *and* RBW < 23 kHz	"Fast Tuning" on page 1072
	All other conditions	"Best Wide-offset" on page 1071
EP4 (available in CXA for improved phase noise)	Span > 101 MHz *or* RBW > 1.15 MHz *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 1072
	CF is < 109 kHz *or* CF >= 4.95 MHz *and* Span <= 666 kHz *and* RBW < 28 kHz	"Best Close-in" on page 1070
	All other conditions	"Best Wide-offset" on page 1071
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 1072 are actually the same as "Best Close-in" on page 1070, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, *or* RBW > 250 kHz, *or* Source Mode is set to “Tracking”	"Fast Tuning" on page 1072
	Center frequency is < 25 kHz, *or* CF >= 1 MHz *and* Span <= 141.4 kHz *and* RBW <= 5 kHz	"Best Close-in" on page 1070
	All other conditions	"Best Wide-offset" on page 1071

In all the above cases:

- The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter
- The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP1	1	Best Close-in	[offset < 140 kHz]
	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]
EP2, EP3, EP5	1	Best Close-in	[offset < 70 kHz]
	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
EP4	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

Noise Correction

Sets the measurement noise floor correction function to On or Off. On enables measurement noise correction when the measured power in the reference channel or any offset is close to the noise floor of the instrument. Off turns these corrections off.

In instruments with the noise floor extensions option (option NFE) enabled, there are two ways to compensate for the analyzer noise floor: through the NFE and through this noise corrections control. The techniques are results are similar but not identical. NFE uses a model of the analyzer noise floor, adapted to the current conditions such as center frequency, RBW and ambient temperature. The parameters of this model are measured in the factory or field calibration in a highly averaged measurement. So, they are consistent. However, because the model is imperfect, the corrections are imperfect. Using NFE is very convenient; the user need not wait for the ACP noise corrections calibration to occur. The ACP NC calibration, though, has advantages of being measured very recently, at the current ambient, and the exact center frequency, with no requirement that the model be perfect. So, it will often (but not always) have slightly better dynamic range. If both ACP NC is turned on and NFE is turned on, the instrument uses only the ACP NC. When ACP NC is turned off, but NFE is on, NFE is used, and performance should still be excellent.

When **Meas Method** is Fast Power, HW supported noise correction works when either or both of Noise Correction and NFE is on.

Remote Command	`[:SENSe]:ACPower:CORRection:NOISe[:AUTO] OFF | ON | 0 | 1` `[:SENSe]:ACPower:CORRection:NOISe[:AUTO]?`
Example	`:ACP:CORR:NOIS OFF` `:ACP:CORR:NOIS?`
Dependencies	Not available when "Meas Method" on page 963 is RBW or Fast
Preset	0
State Saved	Saved in instrument state
Range	`OFF|ON`

Noise Floor Extension

Lets you turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer), support two states of NFE, Full and Adaptive. The `ON` state (in Modes that do not support Adaptive NFE) matches the `FULL` state (in Modes that *do* support Adaptive NFE).

In `ON` or `FULL` NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE (see "Adaptive NFE" on page 1076 below), there is not the same dramatic visual impact on the noise floor as there is in `FULL` NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-`OFF` case; and when lots of averaging is being performed, the signal displays more like the `FULL` NFE case.

Adaptive NFE (in Modes that support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the **Average Type** set to Power.

In those cases where the cancelation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having **Noise Floor Extension**ON.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE	**Noise Floor Extension** has no effect unless the RF Input is selected, so it does nothing when External Mixing is selected. In Modes that support Adaptive NFE, the default state of NFE is `ADAptive`. In Modes that do not support Adaptive NFE, the default state of NFE is `OFF`. Prior to the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was `OFF` for all Modes.

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but has no effect) Not available in VXT models M9410A/11A
Couplings	When NFE is enabled in any Mode manually, a prompt is displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled via SCPI, and a Characterize Noise Floor operation is needed, an error is entered in the system error queue
Preset	Unaffected by **Mode Preset**. Turned ON at startup and by **Restore Mode Defaults** in Modes that support Adaptive. Turned OFF at startup and by **Restore Mode Defaults** in Modes that do not support Adaptive
State Saved	No

Adaptive NFE

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAptive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAptive?`
Example	`:CORR:NOIS:FLO ON` First turn NFE ON, this is FULL mode

	:CORR:NOIS:FLO:ADAP ON Then set it to ADAptive
Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but will have no effect)
Couplings	Sending :CORR:NOIS:FLO ON turns NFE Adaptive OFF for backwards compatibility. So, to turn ADAptive on, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by **Mode Preset**, but set to ON at startup and by **Restore Mode Defaults**
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average, and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn't smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (**Average Type** = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low-level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, *and* once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

```
“This action will take several minutes to perform. Please disconnect all cables
from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone
to postpone for a week.”
```

If you cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

Fast Power RBW Mode

Specifies RBW behavior of Fast Power under **Meas Method**.

Option	SCPI	Description
Best Speed	SPEed	The acquisition RBW is set to be configured for best speed. The RBW is automatically calculated, and is not configurable
Explicit	EXPLicit	You can configure RBW manually

Remote Command	[:SENSe]:ACPower:BANDwidth[:RESolution]:FPOWer:MODE SPEed | EXPLicit [:SENSe]:ACPower:BANDwidth[:RESolution]:FPOWer:MODE?
Example	:ACP:BAND:FPOW:MODE EXPL :ACP:BAND:FPOW:MODE?
Dependencies	Grayed-out when "Meas Method" on page 963 is not Fast Power Not available in VXT models M9410A/11A/15A
Couplings	If EXPLicit is selected, "Res BW" on page 929 is configurable. If not, **Res BW** is grayed-out
Preset	SPEed
State Saved	Saved in instrument state

Fast Power IF Gain Offset

Lets you optimize for dynamic range versus input signal level.

Remote Command	[:SENSe]:ACPower:IF:GAIN:FPOWer <integer> [:SENSe]:ACPower:IF:GAIN:FPOWer?
Example	:ACP:IF:GAIN:FPOW 10 :ACP:IF:GAIN:FPOW?
Dependencies	Grayed-out when "Meas Method" on page 963 is not Fast Power Not available in VXT models M9410A/11A/15A
Preset	0
State Saved	Saved in instrument state
Min/Max	-20/20

Integration BW

Selects an Integration BW passband from either -3 dB (DB3) or -6 dB (DB6).

Remote Command	[:SENSe]:ACPower:FILTer:BANDwidth[:INTegration] DB3 | DB6 [:SENSe]:ACPower:FILTer:BANDwidth[:INTegration]?

Example	`:ACP:FILT:BAND DB3` `:ACP:FILT:BAND?`
Dependencies	Applicable for carriers and offsets whose filter method is not RRC, and when "Meas Method" on page 963 is other than `RBW`
Preset	`DB3`
State Saved	Saved in instrument state
Range	-3 dB|-6 dB

3.5.13.5 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, "Global Center Freq" on page 2013) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to `ON`, it applies to all Modes that support Global settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched `ON`, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the **Center Frequency** remains unchanged.

Adjusting the **Center Frequency** of any Mode that supports Global Settings, while **Global Center Freq** is `ON`, modifies the **Global Center Freq**.

When **Global Center Freq** is switched `OFF`, the **Center Frequency** of the current Mode is unchanged, but now the **Center Frequency** of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is `ON`, the **Global Center Freq** is preset to the preset **Center Frequency** of the current Mode.

This function resets to `OFF` when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL`

	:INST:COUP:FREQ:CENT?
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	ALL|NONE

Preset	OFF
Backwards Compatibility SCPI	:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF :GLOBal:FREQuency:CENTer[:STATe]?

Global EMC Std

When this control is switched ON, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the **Global EMC Std**, so you can switch between any of these Modes and the EMC Std remains unchanged.

Adjusting the EMC Std of any Mode that supports Global settings, while **Global EMC Std** is ON modifies the **Global EMC Std**.

When **Global EMC Std** is switched OFF, the EMC Std of the current Mode remains unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is ON, **Global EMC Std** is preset to the preset EMC Std of the current Mode.

This function resets to OFF when "Restore Defaults" on page 2016 is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:EMC:STANdard ALL | NONE :INSTrument:COUPle:EMC:STANdard?
Example	:INST:COUP:EMC:STAN ALL :INST:COUP:EMC:STAN?
Dependencies	Only available if Option EMC is installed
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	ALL | NONE

Global Limit Lines (Freq and Amptd)

When this control is set to ALL, the current Mode's Limit Line is copied into the **Global Limit Lines**, and from there to all Modes that support Global settings and use **Global Limit Lines**, so you can switch between any of these Modes and the Limit Lines remain unchanged.

Adjusting the Limit Lines of any Mode that supports **Global** Settings, while **Global Limit Lines** is ALL, modifies the **Global Limit Lines**.

When **Global Limit Lines** is set to `NONE`, the Limit Lines of the current Mode are unchanged, but now the Limit Lines of each Mode are once again independent. When **Mode Preset** is pressed while **Global Limit Lines** is `ALL`, **Global Limit Lines** is preset to the preset Limit Lines of the current Mode.

This function is reset to `NONE` when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:LLINe ALL | NONE` `:INSTrument:COUPle:LLINe?`
Example	`:INST:COUP:LLIN ALL | NONE` `:INST:COUP:LLIN?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL | NONE`

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned `ON`, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function resets to `OFF` when "Restore Defaults" on page 2016 is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON|OFF`

Restore Defaults

Resets all functions in the **Global** settings menu to `OFF`. Pressing **System**, **Restore Defaults**, **All Modes** has the same effect.

Remote Command	`:INSTrument:COUPle:DEFault`

Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.5.13.6 Offset RRC Weighting (Backwards Compatibility SCPI)

Example	`:ACP:FILT OFF` `:ACP:FILT?`
Couplings	This command is an alias of: `[:SENSe]:ACPower:OFFSet[1]|2:LIST:FILTer[:RRC][:STATe]` Sending the command sets values of all offsets for BS and MS, but the query always returns a value of BS Offset A
Preset	SA, LTEAFDD, LTEATDD, MSR: `OFF` WCDMA: `ON`
State Saved	Yes

Backwards Compatibility SCPI	`[:SENSe]:ACPower:FILTer[:RRC][:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:ACPower:FILTer[:RRC][:STATe]?`
	`[:SENSe]:ACPR:FILTer[:RRC][:STATe]`
	`[:SENSe]:MCPower:FILTer[:RRC][:STATe]`

3.5.13.7 Offset Filter Alpha (Backward Compatibility SCPI)

Example	`:ACP:FILT:ALPH 0.5` `:ACP:FILT:ALPH?`
Couplings	This command is an alias of: `[:SENSe]:ACPower:OFFSet[1]|2:LIST:FILTer:ALPHa` Sending the command sets values of all offsets for BS and MS, but the query always returns a value of BS Offset A
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.00

Backwards Compatibility SCPI	`[:SENSe]:ACPower:FILTer[:RRC]:ALPHa <real>`
	`[:SENSe]:ACPower:FILTer[:RRC]:ALPHa?`
	`[:SENSe]:ACPR:FILTer[:RRC]:ALPHa`
	`[:SENSe]:MCPower:FILTer[:RRC]:ALPHa`

3.5.13.8 Method for Carrier (Backward Compatibility SCPI)

Example	`:ACP:CARR2:LIST:METH RRC` `:ACP:CARR2:LIST:METH?`
Notes	Maximum of Array length depends on the number of carriers
Couplings	This command is an alias of: `[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe]` The enum value translates as follows: – RRC Weighted = `1|ON` – Integ BW = `0|OFF` Maximum of Array length depends on the number of carriers
Preset	**Modes** / **Value**: SA: `IBW` WCDMA: `RRC` LTEAFDD, LTEATDD, MSR: `IBW`
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:LIST:METHod IBW | RRC, …` `[:SENSe]:ACPower:CARRier[1]|2:LIST:METHod?`

3.5.14 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

3.5.14.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can select a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the **Meas Uncal** indicator will appear if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE Significantly faster sweep times are available with Option FS1.

NOTE The **Meas Uncal** (measurement uncalibrated) warning is displayed in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will provide accurate measurements; if you sweep faster than this your measurements may be inaccurate. A **Meas Uncal** condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

NOTE On non-sweeping hardware, this control is grayed-out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement. If you need to specify the same "Sweep Time" as you would for sweeping hardware, send `[:SENSe]:<meas>:SWEep:TIME <time>`. The measurement emulates the "Sweep Time" effect, but this emulation is not straightforward, and therefore the behavior is not specified. Instead, we recommend using Minimum Acquisition Time, which provides better control.

Remote Command	`[:SENSe]:<meas>:SWEep:TIME <time>` `[:SENSe]:<meas>:SWEep:TIME?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME 25ms`
	`:CHP:SWE:TIME?`

Notes	In the ACP measurement in WCDMA Mode, this parameter is preset by **Meas Method** selection. Preset

	values are as follows: – IBW: 29 ms – IBWR: 108 ms – FAST 7.5 ms
Dependencies	On non-sweeping hardware, this control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time In those instruments, "Minimum Acquisition Time" on page 1087 is available
Couplings	Coupled to **Span**, **RBW**, **VBW**, and **Sweep Time Rules** when **Sweep Time** is set to Auto; **Sweep Time** changes when these parameters are changed When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically Calculated unless noted below WCDMA Mode – Channel Power: 1.0 msOBW: 32.6 ms – ACP: 29 ms
State Saved	Saved in instrument state
Min	Other than non-sweeping hardware: Typically, 1 ms Non-sweeping hardware: N/A In the ACP measurement, when **Meas Method** is **Fast Power**, the minimum sweep time is span-dependent and automatically calculated
Max	Other than non-sweeping hardware: 4000 s Non-sweeping hardware: N/A
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) A "#" mark appears before "Sweep" in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the register: `STATus:QUEStionable:INTegrity:UNCalibrated`

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:TIME:AUTO OFF | ON | 0 | 1` `[:SENSe]:<meas>:SWEep:TIME:AUTO?`

Example	Channel Power measurement:
	`:CHP:SWE:TIME:AUTO OFF`
	`:CHP:SWE:TIME:AUTO?`

Preset	WCDMA Mode: `OFF` All others: `ON`

Minimum Acquisition Time

Available on non-sweeping hardware.

Specifies the minimum acquisition time for each “chunk” of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is:

~(>~Minimum Acquisition Time) * (The number of chunks)

When in Auto, this parameter’s value is determined by other parameters, such as **Span**, **RBW** and **VBW**.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on **Detector** settings.

Note that the actual acquisition time for each chunk may exceed the **Minimum Acquisition Time** value, in order to satisfy FFT time required by other parameters, and to perform an integer number of FFTs.

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME <time>`
	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`

Example	Channel Power measurement
	`:CHP:SWE:ACQ:TIME 500 ms`
	`:CHP:SWE:ACQ:TIME?`

Dependencies	Available only on non-sweeping hardware
Couplings	Coupled to **Span**, **RBW**, and **VBW** when in the Auto state When you manually set a value when in the **Auto** state, the state automatically changes to **Man**
Preset	Automatically calculated
State Saved	Saved in instrument state
Min	100 ns
Max	4.00 ks

Auto Function

Remote Command	`[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO OFF	ON	0	1` `[:SENSe]:<meas>:SWEep:ACQuisition:TIME:AUTO?`

	`<meas>` is the identifier for the current measurement; any one of `CHPower-|ACPower|OBWidth|MONitor`
Example	Channel Power measurement: `:CHP:SWE:ACQ:TIME:AUTO OFF`
Preset	`ON`

Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See "More Information" on page 1088

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	Put instrument into **Single** measurement operation:
	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	Put instrument into **Continuous** measurement operation:
	`:INIT:CONT 1`
	`:INIT:CONT ON`

Preset	`ON` Note that `:SYST:PRES` sets `:INIT:CONT` to `ON`, but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is **Single** – A loop with an arrow is **Continuous**
Backwards Compatibility Notes	X-Series A-models had **Single** and **Cont** hardkeys in place of the **SweepSingleCont** softkey. In the X-Series A-models, if in single measurement, the **Cont** hardkey (and `INIT:CONT ON`) switched to continuous measurement, but never restarted a measurement and never reset a sweep X-Series B-models have a **Cont/Single** toggle control instead of **Single** and **Cont** hardkeys, but it is still true that, if in single measurement, the **Cont/Single** toggle control never restarts a measurement and never resets a sweep

More Information

Continuous Mode	The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the **Average/Hold Num**, the count stops incrementing, but the instrument

	keeps sweeping See the **Trace** key description under **Trace Average** for the averaging formula used both before and after the **Average/Hold Num** is reached. The trigger condition must be met prior to each sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**
Single Mode	The instrument takes a single sweep when in **Single** mode, or if in average or Max/Min Hold, or if there is a **Waterfall** window displayed, it takes multiple sweeps until the average/hold count reaches the **Average/Hold Num**, then the count stops incrementing, and the instrument stops sweeping See the **Trace** key description under **Trace Average** for the averaging formula used. The trigger condition must be met prior to the sweep The type of trace processing for multiple sweeps is set under the **Trace** key, with choices of **Trace Average**, **Max Hold**, or **Min Hold**

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

– `:INIT:CONT 1` has no effect

– `:INIT:CONT 0` places the instrument in Single Sweep but has no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state

See "Restart" on page 2018 for details of `:INIT:IMMediate`.

If the instrument is already in **Single** sweep, `:INIT:CONT OFF` has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending `:INIT:IMM` *does* reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending `:CALC:AVER:TCON UP`.

Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending `:INIT:IMM`
- Sending `:INIT:REST`

See "More Information" on page 1090

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` perform exactly the same function
Couplings	Resets average/hold count k. For the first sweep overwrites all active (update = on) traces with new current data. For application modes, it resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis Mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **MaxHold** and **MinHold** traces as well

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

Event	Trace Effect
Clear/Write pressed (even if already in Clear/Write)	Set to mintracevalue
Max Hold pressed (even if already in Max Hold)	Set to mintracevalue

Event	Trace Effect
Min Hold pressed (even if already in Min Hold)	Set to maxtracevalue
Trace Average pressed (even if already in Trace Average)	Trace data unaffected but start new sweep/avg/hold
Restart pressed	Trace data unaffected but start new sweep/avg/hold
Parameter requiring restart changed (e.g., RBW)	Trace data unaffected but start new sweep/avg/hold

Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count k to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

Averaging

The weighting factor used for averaging is k. This k is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This k is used for comparisons with N, as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold, K, shows the count for the sweep (data acquisition) in progress. K = k + 1, with a limit of N. The displayed value K changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When paused, the label on the control changes to **Resume**. Pressing **Resume** un-pauses the measurement. When paused, pressing **Restart** performs a Resume.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Annotation	Only on control

Abort (Remote Command Only)

Stops the current measurement. Aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes *before* the abort function is performed, so `:ABORt` does not abort an alignment.

If the instrument is set for **Continuous** measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for **Single** measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If :`INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :`INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support this command
Status Bits/OPC dependencies	The `STATus:OPERation` register bits 0 through 8 are cleared , *except* bit 6 (Waiting for Periodic Sync). Initiating a measurement and Waiting for Periodic Sync could be asynchronous The `STATus:QUEStionable` register bit 9 (`INTegrity` sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the Abort command will cause the `*OPC` query to return true

Sweep Time Annotation (Remote Query Only)

Returns the **Sweep Time Annotation** value. Available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the estimated turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	`[:SENSe]:<meas>:SWEep:ETIMe?` `<meas>` is the identifier for the current measurement; any one of `CHPower|ACPower|OBWidth|MONitor`
Example	Channel Power measurement

	:CHP:SWE:ETIMe?
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

3.5.14.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument.

Sweep Time Rules

Switches the instrument between NORMal and ACCuracy sweep states.

Setting Auto Sweep Time to ACCuracy results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when Auto Sweep Time is set to ACCuracy.

Additional amplitude errors that occur when Auto Sweep Time is set to NORMal are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, NORMal is the preferred setting of Auto Sweep Time. Auto Sweep Time is set to NORMal on a Preset. This means that in the Preset state, instrument amplitude accuracy specifications do not apply.

Remote Command	[:SENSe]:ACPower:SWEep:TIME:AUTO:RULes NORMal | ACCuracy [:SENSe]:ACPower:SWEep:TIME:AUTO:RULes?
Example	:ACP:SWE:TIME:AUTO:RUL NORM :ACP:SWE:TIME:AUTO:RUL?
Dependencies	Does not appear in Spectrum Analyzer Mode in VXT model M9420A
Preset	(see table below)
State Saved	Saved in instrument state
Range	NORMal|ACCuracy

Preset:

Modes, Instruments	Value
SA, WCDMA, LTEAFDD, LTEATDD, MSR	ACCuracy
5G NR	NORMal
5G NR in VXT models M9410A/11A/15A	ACCuracy

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument. Since markers are read at the point location, the marker reading may change. The sweep time resolution changes. Trace data for all the traces is cleared and, if **Sweep** is in **Cont**, a new trace is taken. If any trace is in average or hold, the averaging starts over.

Because of sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message "Sweep points changed, all traces cleared" is displayed and in 5G NR Mode, **Auto Sweep Points** is set to `OFF` (0).

Remote Command	`[:SENSe]:ACPower:SWEep:POINts <integer>` `[:SENSe]:ACPower:SWEep:POINts?`
Example	`:ACP:SWE:POIN 500` `:ACP:SWE:POIN?`
Dependencies	Not available when Signal ID is On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in Modes that do not support **Swept** This parameter is automatically calculated and not configurable when **Meas Method** is set to Fast Power
Couplings	Whenever the number of sweep points change: – All trace data is erased – Any traces with Update Off will also go to Display OffSweep time is re-quantized – Any limit lines that are on will be updated – If averaging/hold is on, averaging/hold starts over – **Auto Sweep Points** is set to `OFF` (5G NR Mode only)

	The resolution of setting the sweep time depends on the number of points selected	
Preset	5G NR Mode, in all models except M9410A/11A/15A	5001
	All others	1001
State Saved	Saved in instrument state	
Min	1	
Max	20001	
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation	

IF Dithering

Lets you turn IF Dithering on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	`[:SENSe]:SWEep:IF:DITHer OFF | ON | 0 | 1` `[:SENSe]:SWEep:IF:DITHer?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`OFF`
State Saved	Saved in instrument state

Image Protection

Lets you turn IF Protection on or off. This is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	`[:SENSe]:SWEep:IMAGeprot OFF | ON | 0 | 1` `[:SENSe]:SWEep:IMAGeprot?`
Dependencies	Only appears in Spectrum Analyzer Mode in VXT models
Preset	`ON`
State Saved	Saved in instrument state

3.5.14.3 X Scale

Accesses controls that enable you to set the horizontal scale parameters.

Auto Scaling

Toggles the scale coupling function On or Off.

Remote Command	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPle 0 | 1 | OFF | ON` `:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPle?`
Example	`:DISP:ACP:WIND:TRAC:X:COUP ON` `:DISP:ACP:WIND:TRAC:X:COUP?`
Couplings	When **Auto Scaling** is ON and the "Restart" on page 2018 front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results When you set a value to either **Scale/Div** or **Ref Valu**e manually, **Auto Scaling** automatically changes to OFF
Preset	OFF
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:X[:SCALe]:COUPle`

3.5.15 Trace

Lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

For the Spectrum Analyzer Mode, when in **Single** Mode, Measurements and their Views save the trace data from the last acquisition. This is true for multiple screens. The marker and trace data will be present whenever the measurement is brought back into focus. The measurement switches for these measurements do not clear the traces, so the data will be present until the next acquisition is completed.

3.5.15.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

Select Trace appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Dependencies	For the Swept SA measurement: – In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View – When you turn on Image Suppress, Update turns off for all traces except the selected trace For the ACP measurement, when **Meas Method** is `RBW`, `FAST` or `FPOWer`, **Select Trace** is disabled
Preset	Trace 1
State Saved	Yes

3.5.15.2 Trace Control

The controls on this tab allow you to set the "Trace Type" on page 1905 and its update mode.

There are four Trace Types:

- Clear/Write
- Trace Average
- Max Hold
- Min Hold

Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not, and whether it is being displayed or not. These values, **Update** and **Display,** are described fully in the "View/Blank" on page 1721 control description. Essentially, when **Update** is `ON`, a trace is updating, and when **Update** is `OFF` it is not. When **Display** is `ON`, it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions in this section.

Trace Type

There are four trace Types:

Option	Parameter	SCPI Example	Details
Clear/Write	`WRITe`	`:TRAC2:TYPE WRIT`	See: "Clear/Write" on page 1101
Trace Average	`AVERage`	`:TRAC2:TYPE AVER`	See: "Trace Average" on page 1102
Maximum Hold	`MAXHold`	`:TRAC3:TYPE MAXH`	See: "Max Hold" on page 1102
Minimum Hold	`MINHold`	`:TRAC5:TYPE MINH`	See: "Min Hold" on page 1103

Full descriptions of each type are provided below. You may select one of these types for each trace. Re-selecting the current **Trace Type** initiates the same action that selecting it the first time did, even though it is already selected. For example, selecting **Clear/Write** while **Clear/Write** is already selected will nonetheless clear the trace and begin rewriting it.

Besides the **Trace Type**, the "View/Blank" on page 1721 state must be set to **Active** (**Update**: `ON`, **Display**: `ON`) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

See also: "Trace Mode Backwards Compatibility Commands" on page 1099

Remote Command	For Swept SA Measurement (in SA Mode): `:TRACe[1]|2|…|6:TYPE WRITe	AVERage	MAXHold	MINHold` `:TRACe[1]|2|…|6:TYPE?` For all other measurements: `:TRACe[1]|2|3:<meas>:TYPE WRITe	AVERage	MAXHold	MINHold` `:TRACe[1]|2|3:<meas>:TYPE?` where `<meas>` is the identifier for the current measurement
Example	`:TRAC:TYPE WRIT` `:TRAC:TYPE?`
Couplings	Selecting a **Trace Type** (by pressing any of the Trace Type selections or sending `:TRAC:TYPE`) sets the Trace to **Active** (**Update**: `ON`, **Display**: `OFF`), even if the same trace type was already selected When Detector setting is "Auto" (`[:SENSe]:<meas>:DETector:AUTO?)`, Detector `([:SENSe]:<meas>:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: "`NORMal`" with `WRITe` (Clear Write), "`AVERage`" with `AVERage`, "`POSitive` (peak)" with `MAXHold`, and "`NEGative` (peak)" with `MINHold`
Preset	Swept SA and Monitor Spectrum: `WRITe` All other measurements: `AVERage` Following **Preset**, all traces are cleared (all trace points set to mintracevalue)
State Saved	The type of each trace is saved in instrument state
Annunciation	The type for each trace is indicated in the Trace annunciator panel on the Measurement Bar

Trace Mode Backwards Compatibility Commands

In earlier instruments, the "Trace Modes" were: Clear/Write, Max Hold, Min Hold, View and Blank. Averaging was global to all traces and was controlled under the **BW/Avg** menu.

In X-Series, trace averaging can be done on a per-trace basis. The Trace Modes (now called Trace Types) are Clear/Write, Trace Average, Max Hold and Min Hold. View and Blank are set separately under "View/Blank" on page 1721.

While this provides more flexibility, it also gives rise to potential backwards compatibility problems. To mitigate these, the old Trace Mode command has been retained and a new Trace Type command has been added. The :TRACe:MODE command is retained for backwards compatibility, and the :TRACe:TYPE, :TRACe:UPDate and :TRACe:DISPlay commands introduced for ongoing use. The old Trace Modes are selected using :TRAC:MODE, whose parameters are mapped into calls to :TRACe:TYPE, :TRACe:UPDate and :TRACe:DISPlay, and the old global Averaging command [:SENSe]:AVERage[:STATe] is provided for backwards compatibility. See the individual command descriptions for details.

When **Average/Hold** in the **Meas Setup**, **Legacy Compatibility** menu is ON, the following is true for traces in Max Hold and Min Hold:

- They ignore the **Average/Hold** number; **Single** for Max Hold causes one sweep only, so switching to **Single** stops after the current sweep, and switching to **Cont** starts again without clearing the accumulated result
- Max Hold is not cleared on a **Restart**, **Single** or :INIT:IMM, but changing a measurement parameter, like frequency or bandwidth etc., still restarts the Max Hold

Preset	WRITe
State Saved	The trace mode is an alias only
Backwards Compatibility SCPI	:TRACe[1]|2|…|6:MODE WRITe | MAXHold | MINHold | VIEW | BLANk :TRACe[1]|2|…|6:MODE?
Backwards Compatibility Notes	The legacy :TRACe:MODE command is retained for backwards compatibility. In conjunction with the legacy :AVErage command, it works as follows: – :AVErage ON|OFF sets/clears a variable that we will call average for the sake of this discussion. This variable is maintained by the instrument solely for backwards compatibility. See the [:SENSe]:AVERage[:STATe] command description below – :TRACe:MODE WRITe sets :TRACe:TYPE WRITe (Clear/Write) unless average is true, in which case it sets it to :TRACe:TYPE AVErage. It also sets :TRACe:UPDate ON, :TRACe:DISPlay ON, for the selected trace – :TRACe:MODE MAXHold sets :TRACe:TYPE MAXHold (Max Hold). It also sets :TRACe:UPDate ON, :TRACe:DISPlay ON, for the selected trace – :TRACe:MODE MINHold sets :TRACe:TYPE MINHold (Min Hold). It also sets :TRACe:UPDate ON, :TRACe:DISPlay ON, for the selected trace – :TRACe:MODE VIEW sets :TRACe:UPDate OFF, :TRACe:DISPlay ON, for the selected trace – :TRACe:MODE BLANk sets :TRACe:UPDate OFF, :TRACe:DISPlay OFF, for the selected trace The query returns the same value as :TRACe:TYPE?, meaning that if you set :TRACe:MODE:VIEW or :TRACe:MODE:BLANk, the query response will not be what you sent

`:TRACe[n]:MODE` was formerly used to set the type or "writing mode" of the trace. At that time, View and Blank were writing modes. The new `:TRACe:TYPE` command should be used in the future, but `:TRACe:MODE` is retained to provide backwards compatibility

In X-Series, unlike earlier instruments, Max Hold and Min Hold now obey the Average Number and counts up to a terminal value as Average always has

As the **Average/Hold Number** now affects **Min Hold** and **Max Hold**, the operations that restart Averaging (for example, the **Restart** key) now also restart **Min Hold** and **Max Hold**

As a result of these changes, legacy code that restarts averaging while retaining a running Max Hold will need to be rewritten, because the Max Hold will now restart when the Average does

Also, previous to X-Series:

- Pressing **Max Hold** while already in **Max Hold** (or doing so remotely) had no effect. Now it will clear the trace and restart the sweep and the Max Hold sequence
- Changing the vertical scale (Log/Lin or dB/div) of the display restarted **Max Hold** and **Min Hold**. This is no longer the case

Preset	`OFF`
State Saved	The state of Average is saved in Instrument State for ghosting purposes
Backwards Compatibility SCPI	`[:SENSe]:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:AVERage[:STATe]?`
Backwards Compatibility Notes	Previous to X-Series, Averaging (also sometimes known as trace averaging) was global to all traces, that is, it was either on or off for all active traces. The legacy command `[:SENSe]:AVERage [:STATe] ON|OFF|1|0` was used to turn Averaging on or off In X-Series, Averaging is turned on or off on a per-trace basis, so it can be on for one trace and off for another For backwards compatibility, the old global Average State variable is retained solely as a legacy variable, turned on and off and queried by the legacy command `[:SENSe]:AVERage[:STATe] OFF|ON|0|1.` When Average is turned on, any trace in Clear/Write will get put into Average. While Average is on, any trace put into Clear/Write by the old `:TRAC:MODE` command will instead get put into Average. When Average is turned off, any trace in Average will get put into Clear/Write

Trace Type Details

Clear/Write

Each trace update replaces the old data in the trace with new data.

Pressing **Clear/Write** for the selected trace, or sending `:TRAC:TYPE WRIT` for the specified trace, sets the trace type to **Clear/Write** and clears the trace, even if you are already in **Clear/Write**. Then a new sweep is initiated. Trigger conditions must be met before the sweep actually starts, and if in **Single** the sweep won't start until **Restart** is pressed.

Pressing **Clear/Write** stops the current sweep and initiates a new one, so **Trace Average, Max Hold** and **Min Hold** data may be interrupted in mid-sweep when **Clear/Write** is pressed, and therefore may not accurately reflect the displayed count. Therefore, when **Clear/Write** is pressed for one trace, **Trace Average, Max Hold** and **Min Hold** must restart for all traces.

When in **Clear/Write**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), a new sweep is initiated but the trace is not cleared.

Trace Average

The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data.

Pressing **Trace Average** (for the selected trace), or sending `:TRAC:TYPE AVER` (for the specified trace), sets the trace type to **Trace Average**, clears the trace, initiates a new sweep, and restarts the Average sequence.

Details of the count limiting behavior and the averaging calculations may be found under **Avg|Hold Number** and **Average Type** under **Meas Setup.**

When in **Trace Average**, if a measurement-related instrument setting is changed (that is, one which requires new data to be taken, like Center Frequency or Attenuation), the average restarts and a new sweep is initiated but the trace is not cleared.

Restarting the average means:

- The average/hold count k is set to 1, so that the next time the average trace is displayed it simply represents one trace of new data
- A new sweep is initiated
- Once the new sweep starts, the trace is overwritten with current trace data as the first trace of the new average

Remember that restarting averaging also restarts **Max Hold** and **Min Hold**, as there is only one count for Trace Average and Hold.

Max Hold

The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under **Meas Setup.**

Pressing **Max Hold** for the selected trace, or sending `:TRAC:TYPE MAXH` for the specified trace, sets the Trace Type to **Max Hold,** clears the trace , initiates a new sweep, and restarts the hold sequence, even if you are already in **Max Hold**.

When in **Max Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Max Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Max Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the max hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated.

Remember that restarting **Max Hold** also restarts averaging and **Min Hold**, as there is only one count for Trace Average and Hold.

Min Hold

The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data. Details of the count limiting behavior may be found under **Avg|Hold Number** under the **Meas Setup** functions.

Pressing **Min Hold** for the selected trace, or sending `:TRAC:TYPE MINH` for the specified trace, sets the Trace Type to **Min Hold,** clears the trace, initiates a new sweep, and restarts the hold sequence, even if you are already in **Min Hold**.

When in **Min Hold**, if a measurement-related instrument setting is changed(that is, one which requires new data to be taken, like **Center Frequency** or **Attenuation**), the **Min Hold** sequence restarts and a new sweep is initiated but the trace is not cleared.

Restarting the **Min Hold** sequence means:

- The average/hold count k is set to 1, so that the next time the min hold trace is displayed it simply represents one trace of new data
- A new sweep is initiated

Remember that restarting **Min Hold** also restarts **Max Hold** and averaging, because there is only one count for Trace Average and Hold.

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing, as though the "Trace Type" on page 1905 had just been selected. The effect is exactly the same as reselecting the current **Trace Type** again

– the control is provided because it may not be obvious that reselecting the same selection from a radio button menu will take any action.

This control displays different labels, depending on the selected Trace Type:

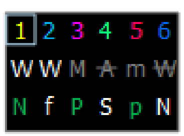
- **Clear/Write**: Clear and Write
- **Trace Average**: Restart Averaging
- **Max Hold**: Restart Max Hold
- **Min Hold**: Restart Min Hold

View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update OFF; Display ON
Blank	Update OFF; Display OFF
Background	Update ON, Display OFF Allows a trace to be blanked *and* continue to update "in the background", which was not possible in the past

In the Swept SA measurement, a trace with **Display**OFF is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **Update**OFF is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **Update**OFF, and Traces 4 and 6 have **Display**OFF.



See: "More Information" on page 1106

Notes	For the commands to control the two variables, Update and Display, see "Trace Update State On/Off" on page 1105 and "Trace Display State On/Off" on page 1105 below
Dependencies	When Signal ID is on, this key is grayed-out
Couplings	Selecting a Trace Type for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (Update ON and Display ON), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending `[:SENS]:DET:TRAC`) puts the trace in **Active** (**Update**ON and **Display**ON), even if that detector was already selected Selecting a "Math Function" on page 1724 other than OFF for a trace (pressing the key or sending the equivalent command) puts the trace in **Active** (**Update**ON and **Display**ON), even if that Math Mode was

already selected

Loading a trace from a file puts that trace in **View** regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:UPDate[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:UPDate[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 2 inactive (stop updating): `:TRAC2:UPD 0`
Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	ON for Trace 1; OFF for 2–6
	For all other measurements:
	`1|0|0`
	ON for Trace 1; OFF for 2 &3

State Saved	Saved in instrument state

Trace Display State On/Off

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe[1]|2|…|6:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|…|6:DISPlay[:STATe]?`
	For all other measurements:
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe] ON | OFF | 1 | 0`
	`:TRACe[1]|2|3:<meas>:DISPlay[:STATe]?`
	where <meas> is the identifier for the current measurement

Example	Make trace 1 visible:
	`:TRAC2:DISP 1`
	Blank trace 3:
	`:TRAC3:DISP 3`

Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace

Preset	For Swept SA Measurement (in SA Mode):
	`1|0|0|0|0|0`
	`ON` for Trace 1; `OFF` for 2–6
	For all other measurements:
	`1|0|0`
	`ON` for Trace 1; `OFF` for 2 &3

State Saved	Saved in instrument state

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display**=`OFF`) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

– if data is written to that trace from remote

– if trace data is loaded from mass storage

– if the trace is the target of a **Copy** or participant in an **Exchange**

– if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update**=`ON`), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display**=`OFF` and/or **Update**=`OFF` does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.5.15.3 Math

Lets you turn on and configure Trace Math functions.

Math Function

Trace Math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a Trace Math function, the indicated function is performed during the sweep with the math function used in place of a detector. The trace operands for the math function are set using the "Operand 1 / Operand 2" on page 1730 controls.

– See "How trace math is processed" on page 1111

Remote Command

For option details, see "Trace Math Options" on page 1109

For Swept SA Measurement (in SA Mode):

```
:CALCulate:MATH <trace_num>, PDIFference | PSUM | LOFFset | LDIFference |
OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate:MATH? <trace_num>
```

where `<trace_num>` is any one of:

`TRACE1|…|TRACE6`

For all other measurements:

```
:CALCulate:<meas>:MATH <trace_num>, PDIFference | PSUM | LOFFset |
LDIFference | OFF, <trace_num>, <trace_num>, <real>,<real>
```

```
:CALCulate[:<meas>]:MATH? <trace_num>
```

where:

`<meas>` is the identifier for the current measurement, and

`<trace_num>` is any one of:

`TRACe1|TRACe2|TRACe3`

Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example

```
:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Diff trace math function, and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,PSUM,TRACE1,TRACE2,0,0
```

Sets Trace 3 to Power Sum trace math function and sets the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2

```
:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0
```

Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB

```
:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00
```

Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm

```
:CALC:MATH TRACE1,OFF,TRACE2,TRACE3,0,0
```

	Turns off trace math for trace 1

Notes	The Trace Math Function command has 6 main set of parameters:
	- Set 1 defines the “result trace”:
	`TRACE1|…|TRACE6`
	-Set 2 defines the “function”:
	`PDIFference|PSUM|LOFFset|LDIFference|OFF`
	- Set 3 is a “trace operand” (1):
	`TRACE1|…|TRACE6`
	- Set 4 is a “trace operand” (2):
	`TRACE1|…|TRACE6`
	- Set 5 defines the “Log Offset” (in dB)
	- Set 6 defines the “Log Difference Reference” (in dBm)
	Note that the trace math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace, then sets the new math function
	The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter will result in a missing parameter message
	The query returns the math mode, the operand traces, the offset and the reference for the specified trace, all separated by commas

Dependencies	Trace Math is not available if **Normalize** is on Trace Math is not available if Signal ID is on None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	When a math function is changed for a trace, that trace is set to Display = ON; and Update = ON
Preset	For Swept SA Measurement (in SA Mode): `OFF,TRACE5,TRACE6,0,0	OFF,TRACE6,TRACE1,0,0	OFF,TRACE1,TRACE2,0,0	OFF,TRACE2,TRACE3,0,0	OFF,TRACE3,TRACE4,0,0	OFF,TRACE4,TRACE5,0,0` For all other measurements: `OFF,TRACE2,TRACE3,0,0	OFF,TRACE3,TRACE1,0,0	OFF,TRACE1,TRACE2,0,0`
State Saved	The trace math function for each trace is saved in instrument state
Annunciation	An “f” is shown on the trace annunciation panel in the Measurement Bar when a math function is on; and the function is annotated on the trace if Trace Annotation is on
Status Bits/OPC dependencies	*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

Trace Math Options

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

`DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))`

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

`DestinationTrace = FirstTrace + Offset`

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

`DestinationTrace = (FirstTrace - SecondTrace) + Reference`

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

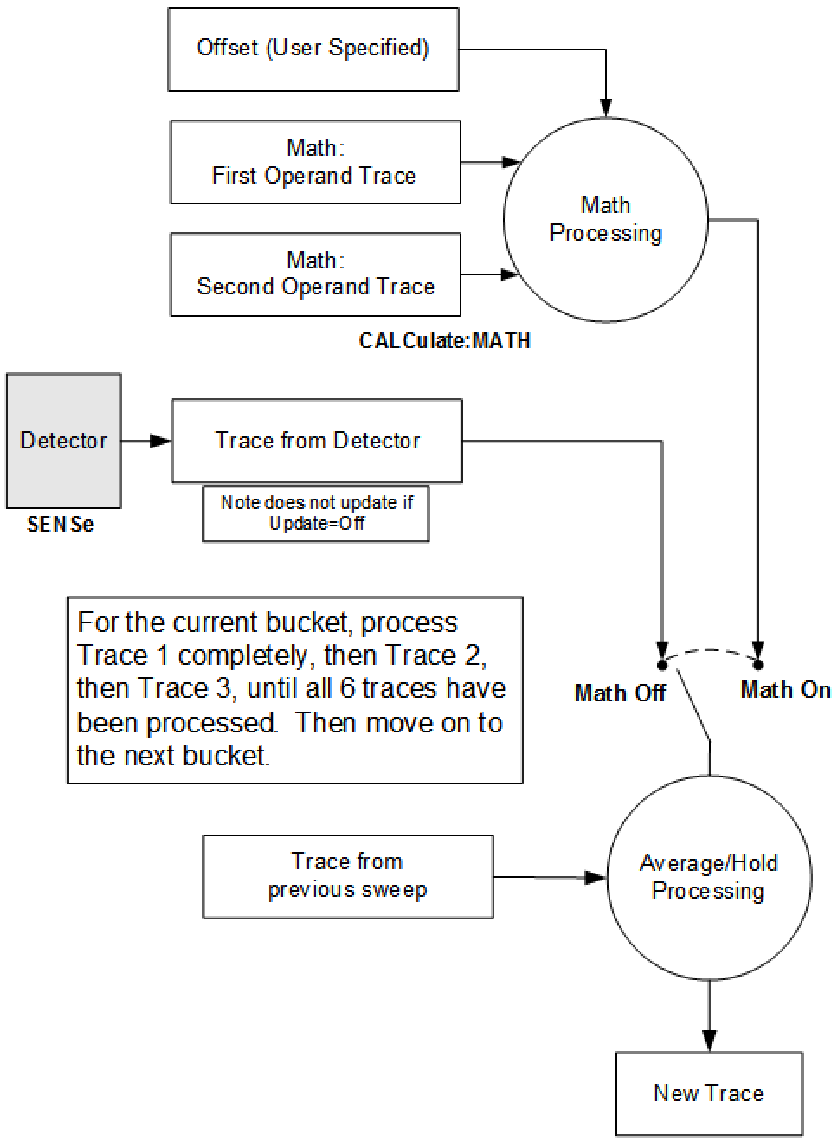
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



NOTE ABOUT OFFSETS: When either External Gain or Ref Level Offset is on, an offset is applied to the trace operands, and when Trace Math is on this offset is applied before any math processing is performed. Since the operands have already been offset the result trace should NOT be offset. Therefore when any Trace Math operation is performed, the sum of (External Gain - Ref Level Offset) is added to the result before it is stored in the result trace.

For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or

from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1 / Operand 2

These two controls select the first and second trace operands to be used for the trace math functions for the destination trace. The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace. Those settings are displayed on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement
	Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2:
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB:
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See "Math Function" on page 1724 for how to specify Operands 1 and 2 using `:CALCulate:MATH`
Dependencies	The destination trace cannot be an operand. The destination trace number is grayed-out on the dropdown
Preset	Operand 1: Trace number minus 2 (wraps at 1). For example, for Trace 1, Operand 1 presets to Trace

	5; for Trace 6, it presets to Trace 4 Operand 2: Trace number minus 1 (wraps at 1). For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operands 1 and 2 for each trace are stored in instrument state

Offset

Used by the Log Offset math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Offset trace math function, set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB: `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

Used by the Log Diff math function.

Example	The following example is for the Swept SA measurement Set Trace 3 to Log Diff trace math function, set the First Trace operand (for Trace 3) to Trace 1, set the Second Trace operand (for Trace 3) to Trace 2, and set the Log Difference reference (for Trace 3) to -6 dBm: `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00`
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.5.15.4 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Selects a detector to be used by the instrument for the current measurement. Allows up to three (3) traces, but each use the same detector type choice. The following choices are available:

Option	Parameters	Description
Auto	See "Detector Select Auto/Man" on page 1116	Detector selected depends on marker functions, trace functions, average type, and the trace averaging function When in AUTO, the detector selected is set to AVERage, unless the Radio Standard defaults state otherwise, for example, it is set to POS for Radio Standard = PDC when Device = both MS and BTS, and when Radio Standard = NADC and Device = MS
Normal	NORMal	Detector determines the peak of the CW-like signals, and yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
Average	AVERage RMS	Detector determines the average of the signal within the sweep points, using RMS averaging
Peak (Positive)	POSitive	Detector determines the maximum of the signal within the sweep points
Sample	SAMPle	Detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
Negative Peak	NEGative	Detector determines the minimum of the signal within the sweep points

Because they may not find a spectral component's true peak, neither Average nor Sample detectors measure amplitudes of CW signals as accurately as Peak or Normal, but they do measure noise without the biases of peak detection.

When **Meas Method** is Fast Power, Auto, Peak and Average are selectable.

Remote Command	`[:SENSe]:ACPower:DETector[:FUNCtion] NORMal | AVERage | POSitive | SAMPle | NEGative | RMS` `[:SENSe]:ACPower:DETector[:FUNCtion]?`

Example	`:ACP:DET NORM`
	`:ACP:DET?`
	`:ACP:DET RMS`
	Sets the detector to AVERage. In ACP, AVERage uses RMS averaging, so this is equivalent to selecting an RMS detector

Notes	The query returns a name that corresponds to the detector type, as shown below The RMS selection sets the detector type to AVERage with RMS averaging. Therefore, if RMS has been selected, the query returns AVER

String Returned	Definition
NORM	Normal
AVER	Average (RMS)
POS	Peak
SAMP	Sample
NEG	Negative Peak

Couplings	When "Detector Select Auto/Man" on page 1116 is **Auto**, **Detector** switches aligning with the switch of this parameter: NORMal with Clear Write, AVERage with AVERage, POSitive (Peak) with MAXHold, and NEGative (Peak) with MINHold When **Detector Select Auto/Man** is **Auto**, **Detector** is set to what the Radio Standard defaults states for all conditions of Trace Type and for all traces When **Detector Select Auto/Man** is set to **Manual**, all Traces use the same detector type When Average State = Off then Trace Types AVERage, MaxHold and MinHold do not function, since Averaging must be 'on' for them to operate. Only one Detector type for all 3 traces is allowed When "Meas Method" on page 963 is RBW or FAST, Detector is disabled
Preset	AVERage
State Saved	Saved in instrument state
Range	NORMal|AVERage|POSitive|SAMPle|NEGative|RMS
Annotation	The four-letter mnemonic for the detector appears in the trace window next to the referenced trace
Backwards Compatibility SCPI	[:SENSe]:ACPR:SWEep:DETector[:FUNCtion]

Detector Select Auto/Man

Sets the Detector mode to Auto (ON|1) or Manual (OFF|0). In Auto, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When you manually select any detector, this toggle is automatically set to Manual (OFF).

Remote Command	[:SENSe]:ACPower:DETector:AUTO ON | OFF | 1 | 0 [:SENSe]:ACPower:DETector:AUTO?
Example	:ACP:DET:AUTO 1 :ACP:DET?
Notes	When "Meas Method" on page 963 is Fast Power, Peak and Average are selectable
Couplings	When **Detector Select Auto/Man** is **Auto**, "Detector" on page 1114 switches aligning with the switch of this parameter: NORMal with **Clear Write**, AVERage with **AVERage**, POSitive with MAXHold, and NEGative with MINHold When **Detector Select Auto/Man** is **Auto**, **Detector** is set to what the Radio Standard defaults states for all conditions of Trace Type and for all traces When **Detector Select Auto/Man** is set to **Manual**, all Traces use the same detector type When Average State = Off then Trace Types AVERage, MaxHold and MinHold do not function, since Averaging must be ON for them to operate
Preset	ON
State Saved	Yes

3.5.15.5 Trace Function

Contains controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the "To Trace" on page 1732 when a "Copy" on page 1732 or "Exchange" on page 1733 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the "From Trace" on page 1732 when a "Copy" on page 1732 or "Exchange" on page 1733 is performed

Preset	2

Copy

Executes a Trace Copy based on the "From Trace" on page 1732 and "To Trace" on page 1732 parameters. The copy operation is from the **From Trace** to the **To Trace**. The action is performed once.

The X-Axis settings and domain of a trace are also copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Copy Trace 1 to Trace 3 and put Trace 3 in Update=Off, Display=On `:TRAC:COPY TRACE1,TRACE3`
Notes	The command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed-out

Couplings	The destination trace is put in **View** (Update = Off, Display = On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

Executes a Trace Exchange based on the "From Trace" on page 1732 and "To Trace" on page 1732 parameters. The **From Trace** and **To Trace** values are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace are also copied when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | … | TRACE6, TRACE1 | … | TRACE6`
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where `<meas>` is the identifier for the current measurement
	Note that the format of the `:TRACe<n>` parameter differs from that for the Swept SA Measurement

Example	Exchange Trace 1 and Trace 2 and put both traces in Update=`OFF`, Display=`ON`: `:TRAC:EXCH TRACE1,TRACE2`
Notes	The command is of the form: `:TRACe:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in **View** (Update=Off, Display=On) after the exchange

Preset All Traces

Turns on Trace 1 and blanks all other traces. This is useful when you have many traces on and you want to return to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points for all traces, except traces in **Min Hold**, in which case it loads `maxtracevalue`, even if **Update** = `OFF`.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL`
Dependencies	When Signal ID is on, this key is grayed-out

3.5.15.6 Advanced

Contains controls for setting advanced trace functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the **Metrics** window, and retrieved by sending a `:READ` or `:FETCh` query:

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:<meas>:MTRace TRACe1 | TRACe2 | TRACe3`
	`:CALCulate:<meas>:MTRace?`
	`<meas>` is the identifier for the current measurement; any one of `CHPower | ACPower | OBWidth | SEMask | SPURious | PVTime`

Example	Channel Power
	`:CALC:CHP:MTR TRAC1`
	`:CALC:CHP:MTR?`

Dependencies	In the ACP measurement, this control is grayed-out when **Meas Method** is set to `RBW` or `FAST`, and only Trace 1 is enabled
Preset	`TRACe1`
State Saved	No
Range	Trace 1 | Trace 2 | Trace 3

3.6 Power Stat CCDF Measurement

Many modern digitally-modulated signals look noise-like in the time and frequency domain, requiring statistical measurement of these signals for meaningful characterization and differentiation. The **Power Statistics Complementary Cumulative Distribution Function** (CCDF) measurement displays curves to characterize the higher-level power statistics of digitally modulated signals. The curves can be useful in determining design parameters for digital communications systems.

The Power Statistics CCDF measurement displays probability on the Y-Axis and amplitude on the X-axis, for a display of the statistical amplitude distribution of a signal. This distribution can be affected by many factors. For example, modulation filtering, modulation format, combining the multiple signals at different frequencies, number of active codes, and correlation between symbols on different codes with spread spectrum systems will all affect measurement results. These factors are all related to modulation and signal parameters. External factors such as signal compression and expansion by nonlinear components, group delay distortion from filtering, and power control within the observation interval also affect the measurement.

The power measured in power statistics CCDF curves is actually instantaneous envelope power defined by the equation:

$P = (I^2 + Q^2) / Zo$

where I & Q are the quadrature voltage components of the waveform, and Zo is the characteristic impedance.

A CCDF curve is defined by how much time the waveform spends at or above a given power level. The percent of time the signal spends at or above the level defines the probability for that particular power level. For capturing a lower probability down to 0.0001%, this measurement is made in the single mode by pressing Single. To make the power statistics CCDF measurement, the instrument uses digital signal processing (DSP) to sample the input signal in the channel bandwidth. The Gaussian distribution line as the band-limited Gaussian noise CCDF reference line, the user-definable reference trace, and the currently measured trace can be displayed on a semi-log graph. If the currently measured trace is above the user reference trace, it means that the higher peak power levels against the average power are included in the input signal.

Power Stat CCDF Measurement Commands

The general functionality of "CONFigure" on page 2732, "INITiate" on page 2733, "FETCh" on page 2733, "MEASure" on page 2735, and "READ" on page 2734 are described in the section **SCPI Operation and Results Query** in the topic

Programming the Instrument.

The following measurement commands and queries are used to configure the measurement:

`:INITiate:PSTatistic`	Initiates a trigger cycle for the `PST` measurement, but does not return any data. You must then use `:FETC:PST[n]?` to retrieve data Does not change any measurement settings
`:CONFigure?`	Returns the long form name of current measurement, in this case, `PSTatistic`
`:CONFigure:PSTatistic`	Selects `PST` measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 1198
`:CONFigure:PSTatistic:NDEFault`	Selects `PST` measurement *without* affecting settings

The following queries are used to retrieve the results:

`:FETCh:PSTatistic?`	Retrieves the data specified by `n`
`:MEASure:PSTatistic[n]?`	Switches to `PST` measurement, restores default values, starts the measurement, then retrieves the data specified by `n`
`:READ:PSTatistic[n]?`	Starts the measurement, then retrieves the data specified by `n`

Measurement Results for Power Stat CCDF

The following table describes the results returned by the `:FETCh`, `:MEASure`, and `:READ` queries listed above, according to the index value `n`.

n	Results Returned		
0	Returns unprocessed I/Q trace data, as a series of trace point values, in volts. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values		
1, or not specified	Returns 11 scalar results:		
	#	**Item**	**Unit, if any**
	1	Average input power	dBm
	2	Probability at the average input power level	%
	3	Power level that has 10 % of the power	
	4	Power level that has 1 % of the power	
	5	Power level that has 0.1 % of the power	
	6	Power level that has 0.01 % of the power	
	7	Power level that has 0.001 % of the power	

n	Results Returned		
	#	**Item**	**Unit, if any**
	8	Power level that has 0.0001 % of the power	
	9	Peak power	dB
	10	Count	
	11	Power level that has 0.00001% of the power if "Minimum Probability" on page 1127 is PP7 (0.00001 %) This value is returned only when PP7 is selected	
2	Returns a series of 5001 floating point numbers (in percent) that represent the current measured power stat trace. This is the probability at particular power levels (average power), in the following order: 1. Probability at 0.0 dB power 2. Probability at 0.01 dB power 3. Probability at 0.02 dB power ... 5000. Probability at 49.9 dB power 5001. Probability at 50.0 dB power		
3	Returns a series of 5001 floating point numbers (in percent) that represent the Gaussian trace. This is the probability at particular power levels (average power), in the following order: 1. Probability at 0.0 dB power 2. Probability at 0.01 dB power 3. Probability at 0.02 dB power ... 5000. Probability at 49.9 dB power 5001. Probability at 50.0 dB power		
4	Returns a series of 5001 floating point numbers (in percent) that represent the user-definable reference trace. This is the probability at particular power levels (average power), in the following order: 1. Probability at 0.0 dB power 2. Probability at 0.01 dB power 3. Probability at 0.02 dB power ... 5000. Probability at 49.9 dB power 5001. Probability at 50.0 dB power		

3.6.1 Views

In the LTEATDD and 5GNR Modes, this measurement has two views: "Normal" on page 1123 and Slot. In all other Modes, there is only a single view (**Normal**). For the SCPI command to select **Slot** View, see Slot View [Mode: LTEATDD, 5GNR].

These are multiple-window Views. When in a multiple-window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

3.6.1.1 Normal

Windows: "Metrics" on page 1124, "Graph" on page 1123

The Power Stat CCDF measurement provides CCDF curves and power statistics metrics. This is common for both Uplink (MS) and Downlink (BTS).

Example	`:PST:SLTV OFF`

3.6.2 Windows

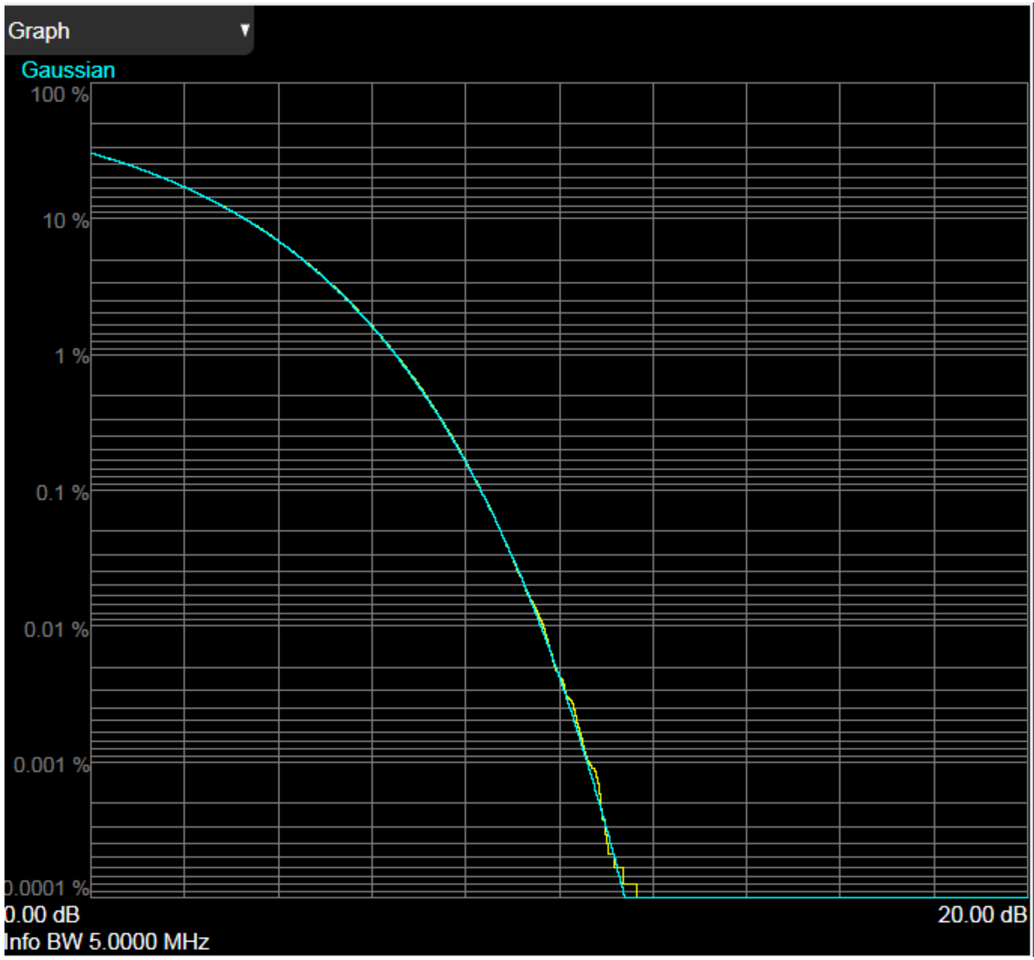
Three window types are defined:

1. "Graph" on page 1123
2. Slot
3. "Metrics" on page 1124

Slot only appears in LTEATDD and 5GNR Modes.

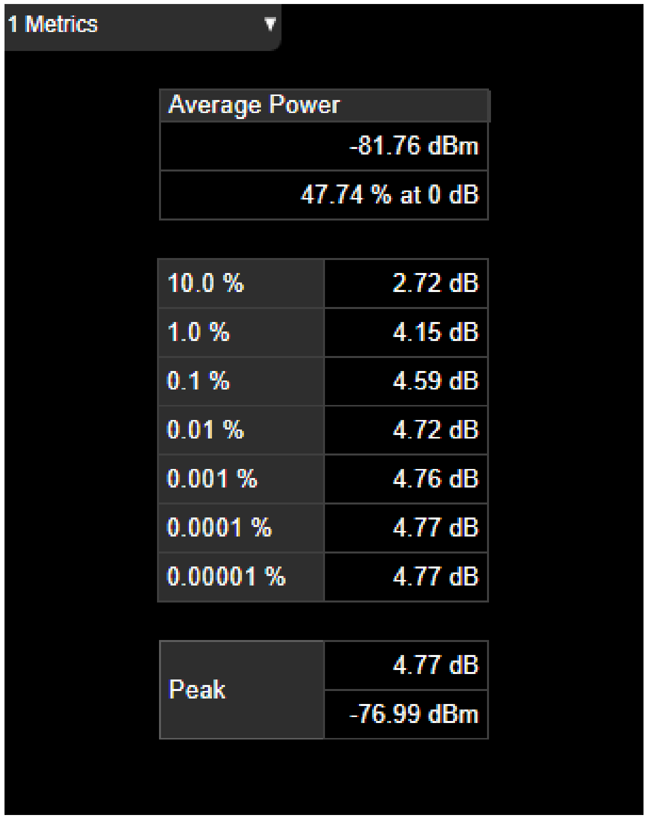
3.6.2.1 Graph

Displays Amplitude versus probability



3.6.2.2 Metrics

Displays the textual results of the Power Stat CCDF measurement.



For the list of n = 1 measurement results, see "Measurement Results for Power Stat CCDF" on page 1121 above.

Name	Unit	Corresponding Results	Results Item for n = 1	Explanation
Average Power	dBm	Average input power	1	99.99 dBm
Average Power	%	Probability at the average input power level	2	99.99 %
10.0%	dB	Power level that has 10 % of the power	3	99.99 dB
1.0%	dB	Power level that has 1 % of the power	4	99.99 dB
0.1%	dB	Power level that has 0.1 % of the power	5	99.99 dB
0.01%	dB	Power level that has 0.01 % of the power	6	99.99 dB
0.001%	dB	Power level that has 0.001 % of the power	7	99.99 dB

Name	Unit	Corresponding Results	Results Item for n = 1	Explanation
0.0001%	dB	Power level that has 0.0001 % of the power	8	99.99 dB
0.00001%	dB	Power level that has 0.00001% of the power if "Minimum Probability" on page 1127 is PP7 (0.00001 %)	11	99.99 dB
Peak	dB	Peak power	9	99.99 dB
Peak	dBm	Not available via remote commands	n/a	99.99 dBm

3.6.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.6.3.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Level Offset

Adds an offset value to the displayed reference level. The reference level is the absolute amplitude represented by the top graticule line on the display.

The on/off switch turns **Ref Level Offset** on or off. Setting a specific value turns **Ref Level Offset**ON.

For more on using offsets, see the Ref Level Offset control description for the Swept SA measurement.

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet <rel_ampl>` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet?`
Example	`:DISP:WIND:TRAC:Y:RLEV:OFFS 12.7` `:DISP:WIND:TRAC:Y:RLEV:OFFS?`

	Sets the Ref Level Offset to 12.7 dB. The only valid suffix is dB. If no suffix is sent, dB will be assumed
Dependencies	Appears only in Spectrum Analyzer Mode
Preset	0 dBm
State Saved	Saved in instrument state
Min	The range for Ref Lvl Offset is variable. It is limited to values that keep the reference level within the range of -327.6 dB to 327.6 dB
Max	327.6 dB
Annotation	The offset is displayed as “Ref Offset <value>” to the right of the reference level annotation if nonzero. When the offset is zero, no annotation is shown

Auto Function

Remote Command	`:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe OFF | ON | 0 | 1` `:DISPlay:WINDow[1]:TRACe:Y[:SCALe]:RLEVel:OFFSet:STATe?`
Example	Turn Ref Level Offset ON: `:DISP:WIND:TRAC:Y:RLEV:OFFS:STAT ON`
Preset	`OFF`

Minimum Probability

Sets the minimum probability range.

Remote Command	`:CALCulate:PSTatistic:RANGe[:PROBability]:MINimum PP2 | … | PP7`
	For parameter values, see "Parameter Options" on page 1127 below
	`:CALCulate:PSTatistic:RANGe[:PROBability]:MINimum?`

Example	`:CALC:PST:RANG:MIN PP6` `:CALC:PST:RANG:MIN?`
Preset	`PP6`
State Saved	Yes
Range	1 % | 0.1 % | 0.01 % | 0.001 %| 0.0001 % | 0.00001 %

Parameter Options

Option	Value
`PP2`	1.0e-2 (1 %)
`PP3`	1.0e-3 (0.1 %)
`PP4`	1.0e-4 (0.01 %)
`PP5`	1.0e-5 (0.001 %)

Option	Value
PP6	1.0e-6 (0.0001 %)
PP7	1.0e-7 (0.00001 %)

3.6.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections that controls all the attenuation functions. Different models in the X-Series come with different configurations.

– See "Dual-Attenuator Configurations" on page 1128

– See "Single-Attenuator Configuration" on page 1129

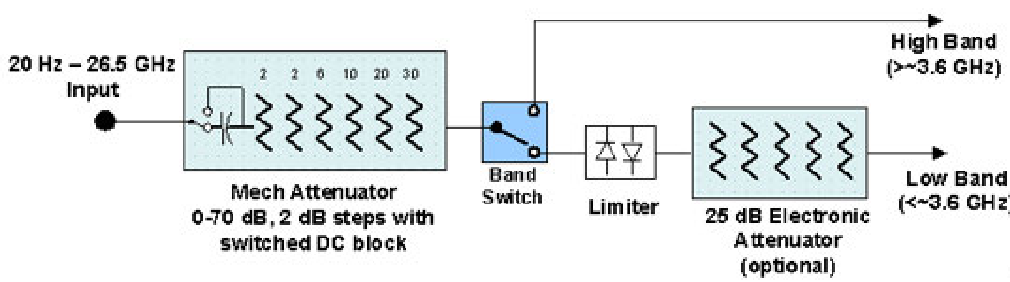
Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by **Meas Preset**.

Only available when the hardware set includes an input attenuator, which is typically only the case for Keysight’s benchtop instruments. For example, this tab does *not* appear in VXT models M9421A/10A/11A, nor in UXM. In UXM, all **Attenuation** and **Range** settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

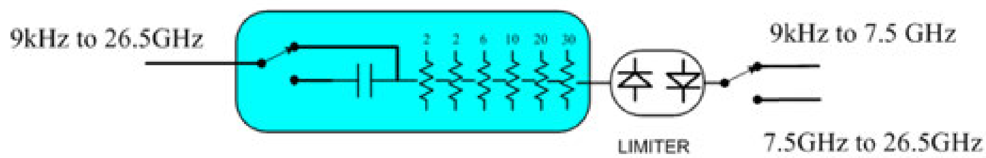
Dependencies	In measurements that support the I/Q inputs, unavailable when I/Q is the selected input. Replaced by the **Range** tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

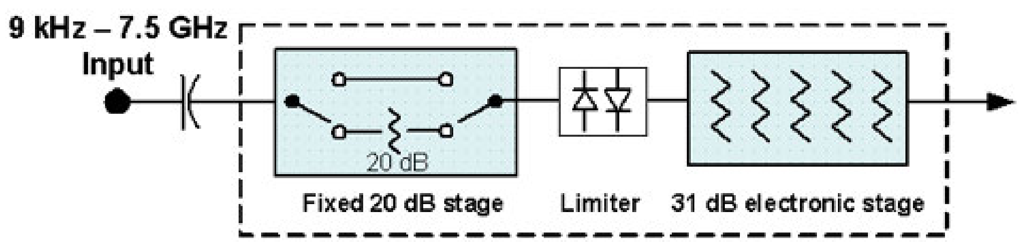


Configuration 2: Mechanical attenuator, no optional electronic attenuator



Note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator Option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration.

Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opens the Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator **Single Attenuator**

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control.)

In the Single-Attenuator configuration, you control the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range, so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless Option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

This control and **Attenuator Summary** only appear in N9041B, when the RF input is selected, the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator in front of RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, but other couplings use this value. See **Reference Level** and "Mech Atten" on page 1935 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the **Input** is **RF**, and the **Input Port** is **RF Input 2**, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten In the **Amplitude**, "Y Scale" on page 1929 menu, and the Atten **Meas Bar** dropdown menu panel, a summary is displayed as follows: “Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten “Total Atten above 50 GHz” followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

Labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

Lets you modify the attenuation applied to the RF input signal path. This value is normally auto-coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 1133

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

Dependencies	Some measurements do not support Auto setting of "Mech Atten" on page 1131. In these measurements, the **Auto/Man** selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting, and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1937 See "Attenuator Configurations and Auto/Man" on page 1133 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB

	(total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixing and BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 1131 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5 GHz. So, when the frequency is changed from below 7.5 GHz to above 7.5 GHz, the attenuation setting will be changed to a multiple of 10 dB which will be no smaller than the previous setting. For example, 4 dB attenuation will be changed to 10 dB
Preset	The preset for Mech Attenuation is “Auto” The Auto value of attenuation is 10 dB ON
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: A: 24 dB (e14) Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

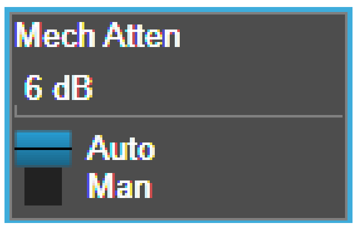
Attenuator Configurations and Auto/Man

As described under "Y Scale" on page 1929, there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 1131 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation.

See "Elec Atten" on page 1937 for more about “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. Does not appear in Single-Attenuator configurations, because the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an **Enable/Disable** toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the **Enable** position.

For more details about the Electronic Attenuator, see "More Information" on page 1135

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation's specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. Does not appear in models with the Single-Attenuator configuration, because in the Single-Attenuator configuration there is no "electronic attenuator"; there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments, and set a "soft" attenuation. The "soft" attenuation is treated as an addition to the "main" attenuation value set by the **Attenuation** control or `:POW:ATT`, and affects the total attenuation displayed on the **Attenuation** control and the Meas Bar The electronic attenuator, and the "soft" attenuation function provided in Single-Attenuator configurations, are unavailable above the low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model). If the low band range is from 0-3.6 GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If "Internal Preamp" on page 1959 is `ON` (that is, set to Low Band or Full), the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out If either of the above is true, and the SCPI command is sent, an error indicating that the electronic attenuator is unavailable is returned If both the above are true, pressing the control generates error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the **Stop Freq** of the instrument is limited to 3.6 GHz and **Internal Preamp** is unavailable If "LNA" on page 1960 is `ON`, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be `OFF` and grayed-out. This coupling works in the following modes/measurements: – Channel Power, Occupied BW, ACP, SEM, Spurious Emissions, Power Stat CCDF measurements in all Modes – Transmit On|Off Power measurement in 5GNR Mode – Power vs. Time and Transmit Power measurement in GSM/EDGE Mode – Burst Power measurement in Spectrum Analyzer Mode

	The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in "Mechanical Attenuator Transition Rules" on page 1135
Preset	0 dB OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 1136 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1937

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below *only* applies to the Dual-Attenuator configurations, and *only* when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

- The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode
- The Auto/Man state of (Mech) Atten is saved

- The Auto/Man toggle on the (Mech) Atten control disappears, and the auto rules are disabled
- The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

- Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled
- Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled
- Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

- The Elec Atten control is grayed out
- The Auto/Man state of (Mech) Atten is restored
- If now in Auto, (Mech) Atten recouples
- If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration.

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an immediate action function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1942.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing **Adjust Atten for Min Clipping** initiates the measurement
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements Appears in the Waveform measurement in 5G NR Mode only

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements

	Appears in the Waveform measurement in 5G NR Mode only
Preset	COMBined
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1941 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 1139

Selection	SCPI	Note
Off	OFF	This is the default setting
On	ON	Available in Single-Attenuator instruments. For compatibility with models that do not have an input attenuator, the ON parameter is supported and mapped to COMBined
Elec Atten Only	ELECtrical	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Elec+Mech Atten	COMBined	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

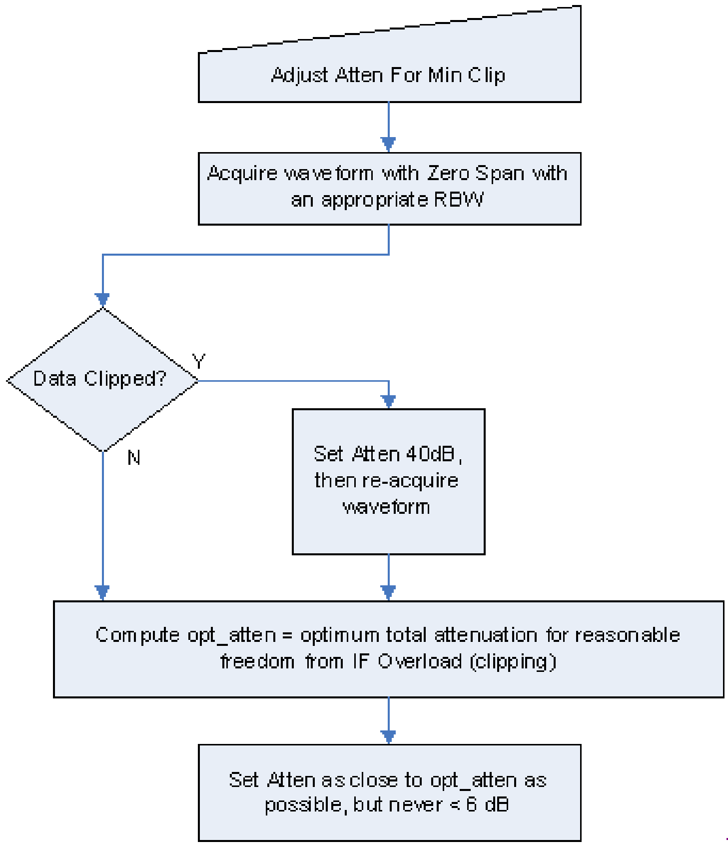
Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	Only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when "Elec Atten" on page 1937 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 1138 is grayed-out Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, available only in 5G NR Mode

Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On
Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?

Adjustment Algorithm

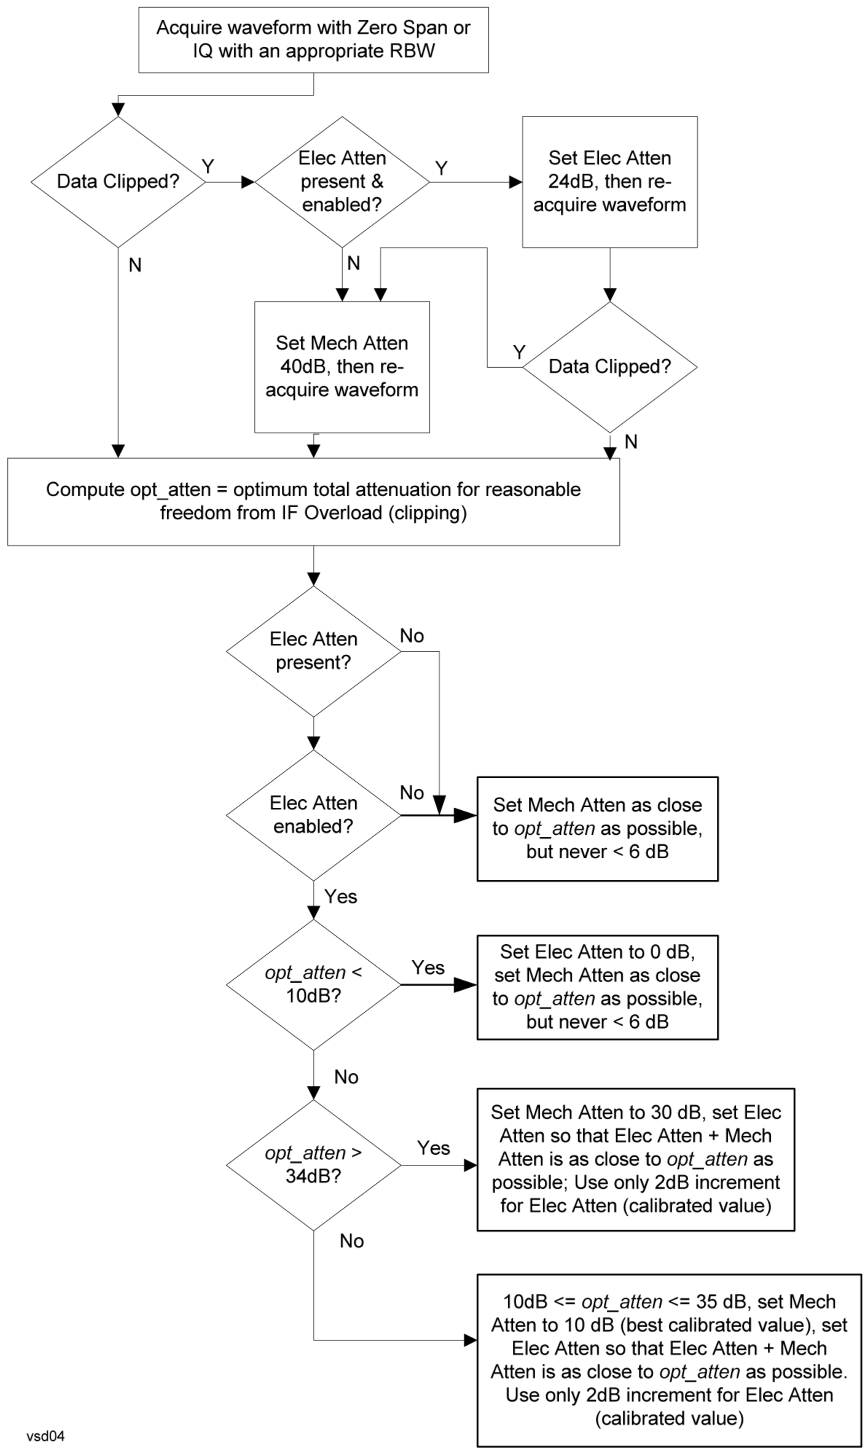
The algorithms for the adjustment are documented below:

Single-Attenuator Models



Dual-Attenuator models

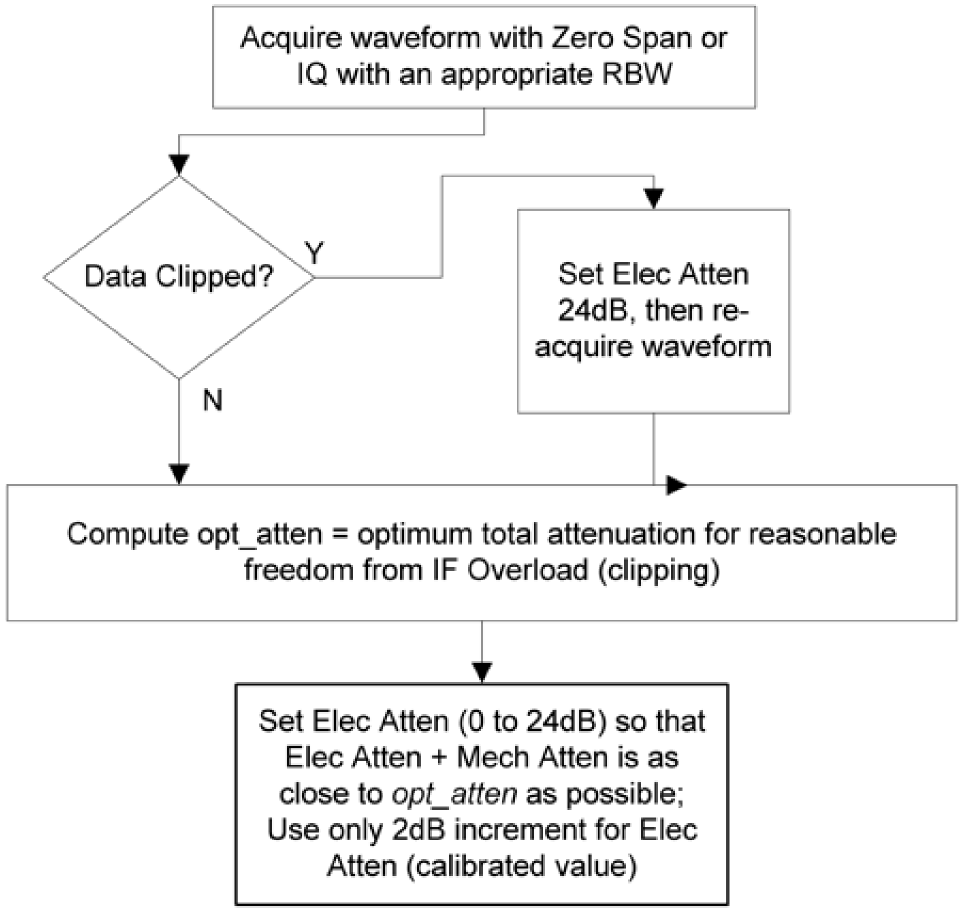
"Adjust Atten for Min Clipping" on page 1941 or "Pre-Adjust for Min Clipping" on page 1138 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Data Clipped?
Y
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Yes
Set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
opt_atten < 10dB?
Yes
No
Set Elec Atten to 0 dB, set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
opt_atten > 34dB?
Yes
No
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible; Use only 2dB increment for Elec Atten (calibrated value)
10dB <= *opt_atten* <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 1138 selection is Elec Only.

Note that the **Mech Atten** value is not adjusted, and the value previously set is used. Therefore, there is a case that IF Overload is still observed depending on the input signal level and the Mech Atten setting.



Mech Atten Step

Controls the step size used when making adjustments to the input attenuation.

Labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB`

	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	Has a toggle control on the front panel, but takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "Max Mixer Lvl Rules" on page 1948.

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real>` `[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?`
Example	`:POW:MIX:RANG -15 dBm` `:POW:MIX:RANG?`
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

`NORMal`	The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the Reference Level is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression with be negligible
`TOI`	Allows a range of settings of the "Max Mixer Level" on page 1947, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size
`COMPression`	Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
`NORMal`	Normal – balance TOI, noise, and compression	–10	–50	0
`TOI`	TOI-limited dynamic range	–25	–50	–10
`COMPression`	Compression-limited dynamic range	–3	–10	+30

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal | TOI | COMPression` `[:SENSe]:POWer[:RF]:MIXer:RULEs?`
Example	`:POW:MIX:RULE:COMP`
Dependencies	Only appears in the Swept SA and RTSA measurements
Preset	`NORM`

3.6.3.3 Range (Baseband Input models)

Only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. In these cases, replaces the **Attenuation** tab.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: “No result; Meas invalid with I/Q inputs”
State Saved	No

Range Auto/Man

The **Auto** setting for **Range** causes the range to be set based on the Y Scale settings. When **Range** is **Auto**, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If **Auto** is not supported in the current measurement, this control is grayed-out, displaying **Man**, and `MAN` is returned to a SCPI query, but this does *not* change the Auto/Man setting for **Range**. When you switch to a measurement that supports **Auto**, it goes back to **Auto** if it was previously in **Auto** mode.

Remote Command	`[:SENSe]:VOLTage:IQ:RANGe:AUTO OFF | ON | 0 | 1` `[:SENSe]:VOLTage:IQ:RANGe:AUTO?`

Example	Put the I Range and Q Range in manual
	`:VOLT:IQ:RANG:AUTO OFF`
	`:VOLT:IQ:RANG:AUTO?`

Dependencies	If **Auto** is not supported, sending the SCPI command generates an error
Couplings	When in **Auto**, both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: YMax = max(abs(top), abs(bottom))

	The I Range and Q Range are then set to YMax
Preset	`ON`
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#"

This is an alternate form of the command to match the `POWer` form of the I Range and Q Range SCPI.

Remote Command	`[:SENSe]:POWer:IQ:RANGe:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer:IQ:RANGe:AUTO?`

Example	Put the I Range and Q Range in manual
	`:POW:IQ:RANG:AUTO OFF`
	`:POW:IQ:RANG:AUTO?`

Notes	`:POW:IQ:RANG:AUTO` is an alternate form of `:VOLT:IQ:RANG:AUTO`, to maintain consistency with I Range and Q Range, which support both the `POWer` and `VOLTage` forms of the command
Preset	`ON`
Range	Auto | Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	`[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage>` `[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?`

Example	Set the I Range to 0.5 V Peak
	`:VOLT:IQ:RANG 0.5 V`
	`:VOLT:IQ:RANG?`

Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When "Q Same as I" on page 1953 is On, the **I Range** value will be copied to "Q Range" on page 1951 Changing the value also sets Range = Man
Preset	Complex `SPECtrum` Measurement: 0.5 V Peak All others: 1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) | 0.5 V Peak (4 dBm @ 50Ω) | 0.25 V Peak (-2 dBm @ 50Ω) | 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation

	"Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote Command	`[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <ampl>` `[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?`

Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω
	`:POW:IQ:RANG 4 dBm`
	`:POW:IQ:RANG?`

Notes	The `POWer` form of the command is provided for convenience. It maps to the same underlying gain range parameter as the `VOLTage` form The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the `VOLTage` form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel. **Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "I Range" on page 1950 determines both I and Q channel range settings.

Remote Command	`[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage>` `[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?`

Example	Set the Q Range to 0.5 V Peak:
	`:VOLT:IQ:Q:RANG 0.5 V`
	`:VOLT:IQ:Q:RANG?`

Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V

	Q Range is only used for Input Path Q Only and Ind I/Q. For input I+jQ, "I Range" on page 1950 determines both I and Q channel range settings
Couplings	When "Q Same as I" on page 1953 is On, the "I Range" on page 1950 value is copied to **Q Range** and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) | 0.5 V Peak (4 dBm @ 50Ω) | 0.25 V Peak (-2 dBm @ 50Ω) | 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote Command	`[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <ampl>` `[:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?`

Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 **Ω**, and to 1.0 V Peak when Reference Z is 75 **Ω**:
	`:POW:IQ:Q:RANG 4 dBm`
	`:POW:IQ:Q:RANG?`

Notes	The `POWer` form of the command is provided for convenience. It maps to the same underlying gain range parameter as the `VOLTage` form of the command The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the `VOLTage` form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way, you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	`[:SENSe]:VOLTage|POWer:IQ:MIRRored OFF | ON | 0 | 1` `[:SENSe]:VOLTage|POWer:IQ:MIRRored?`

Example	Turn off the mirroring of I Range to Q Range
	`:VOLT:IQ:MIRR OFF`
	`:POW:IQ:MIRR OFF`

Couplings	When ON, the "I Range" on page 1950 value is mirrored (copied) to the "Q Range" on page 1951
Preset	ON
State Saved	Saved in instrument state
Range	OFF|ON

3.6.3.4 Range (Non-attenuator models)

Only available for Keysight’s modular signal analyzers and certain other Keysight products, such as VXT

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting

Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements

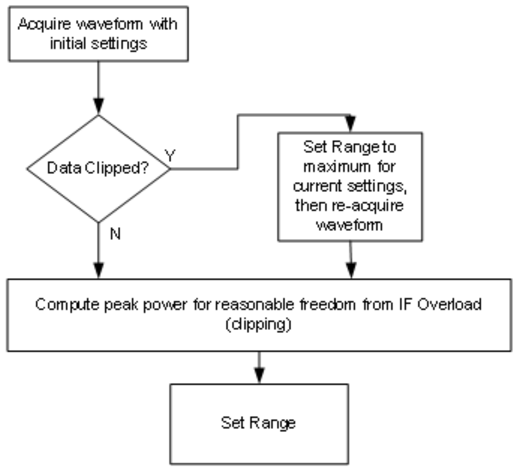
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	Does not appear in the Swept SA and Monitor Spectrum measurements
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1953 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Modes, this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	Does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1955. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.6.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Model M9421A, or UXM.

This tab *does* appear in VXT Models M9410A/11A, because "Software Preselection" on page 1971 is under this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between **Start Freq** and **Stop Freq**, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1958 changes to reflect the new preselector tuning.

Certain considerations should be observed to ensure proper operation, as detailed in "Proper Preselector Operation" on page 1153.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	The rules outlined above under the control description apply for the remote command as well as the key. The result of the command depends on marker position, etc. Any message generated by the control press is also generated in response to the remote command
Dependencies	Does not appear in CXA-m, nor in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if **Stop Freq** is below about 3.6 GHz Grayed-out if entirely above 50 GHz, that is, if **Start Freq** is above 50 GHz – Blanked in models that do not include a preselector, such as Option 503. If the remote command is sent in these instruments, accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering appears in "Preselector Adjust" on page 1958
Status Bits/OPC dependencies	When centering the preselector, `*OPC` does not return true until the process is complete and a subsequent measurement has completed, nor are results returned in response to `:READ` or `:MEASure` queries The `Measuring` bit remains set (true) while this command is operating, and does not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

Certain considerations should be observed to ensure proper operation:

1. If the selected marker is **Off**, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on-screen in a preselected range for the peak search to find

2. If the selected marker is already **On**, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering is attempted, and an advisory message is generated

3. In some models, the preselector can be bypassed. If it is bypassed, no centering is attempted in that range and a message is generated

Preselector Adjust

Lets you manually adjust the preselector filter frequency to optimize its response to the signal of interest. Only available when "Presel Center" on page 1956 is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control is displayed to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is lower than about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is higher than 50 GHz – Blank in models that do not include a preselector, such as Option 503. If the command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1956, or by manually adjusting **Preselector Adjust** Not saved in instrument state, and does not survive a Preset or power cycle

Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	The command has no effect, and the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3 GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

NOTE The maximum **Center Frequency** for Low Band, displayed in square brackets, can change based on the selected IFBW for measurements that support IFBW (for example, Waveform measurement across all Modes that support it). In certain models (such as N9042B & N9032B), IFBW values <= 40 MHz have a maximum Low Band frequency of 3.6 GHz, while 40 MHz < IFBW <= 1 GHz have a maximum of 3.3 GHz, and 1 GHz < IFBW <= 1.5 GHz have a maximum of 3.5 GHz. IFBW values > 1.5 GHz do not support a **Center Frequency** that can reach the Low Band maximum frequency. In these cases, **N/A** is displayed in the square brackets for Low Band.

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL`
	`[:SENSe]:POWer[:RF]:GAIN:BAND?`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Not available on all hardware platforms. If the preamp is not present or is unlicensed, this control is not shown Does not appear in VXT Models M9410A/11A/15A/16A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated Not available when the electronic/soft attenuator is enabled
Preset	`LOW` `OFF`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

LNA is an additional preamplifier that provides superior DANL and frequency range compared to "Internal Preamp" on page 1959. LNA provides lower system noise

figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

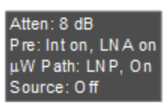
For best possible sensitivity, **LNA** can be turned on *together* with "Internal Preamp" on page 1959, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see "More Information" on page 1157

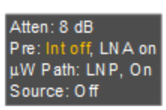
Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires Option LNA, except for VXT models M9415A/16A Does not appear in VXT models M9421A/10A/11A May not appear in some measurements **LNA** is not available when the electronic/soft attenuator is enabled
Preset	`OFF`
State Saved	Saved in State

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to `ON`). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	`:POW:MW:PATH STD`	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	`:POW:MW:PATH LNP`	See "Low Noise Path Enable" on page 1162
µW Preselector Bypass	`:POW:MW:PATH MPB`	See "µW Preselector Bypass" on page 1164
Full Bypass Enable	`:POW:MW:PATH FULL`	See "Full Bypass Enable" on page 1165

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL` `[:SENSe]:POWer[:RF]:MW:PATH?`

Example	`:POW:MW:PATH LNP`
	Enables the Low Noise path
	`:POW:MW:PATH?`

<table>
<tr><td>Notes</td><td>If "Presel Center" on page 1956 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of µW Path Control

The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean “when the low noise path is enabled” but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is Low Noise Path Enable or Full Bypass Enable. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled

Alignment switching ignores the settings in this menu, and restores them when finished</td></tr>
<tr><td>Dependencies</td><td>Does not appear in CXA-m, VXT Models M9410A/11A, nor in BBIQ and External Mixing

– The Low Noise Path Enable selection does not appear unless Option LNP is present and licensed

– The µW Preselector Bypass selection does not appear unless Option MPB is present and licensed

– The Full Bypass Enable selection does not appear unless options LNP and MPB are both present as well as option FBP

In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated

Low Noise Path Enable and Full Bypass Enable are grayed-out if the current measurement does not support them

Low Noise Path Enable and Full Bypass Enable are not supported in Avionics and MMR Modes (non-modulation measurements). In any of these cases (that is, the feature is not supported in either measurement or Mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”</td></tr>
<tr><td>Preset</td><td><table><tr><th>Mode</th><th>Value</th></tr><tr><td>IQ Analyzer

<tr><td>Annotation</td><td>In the Meas Bar, if the Standard path is chosen:
µW Path: Standard
If Low Noise Path is enabled but the LNP switch is not thrown:
µW Path: LNP,Off
If the Low Noise Path is enabled and the LNP switch is thrown:
µW Path: LNP,On
If the preselector is bypassed:
µW Path: Bypass</td></tr>
</table>

If Full Bypass Enable is selected but the LNP switch is not thrown:

µW Path: FByp,Off

If Full Bypass Enable is selected and the LNP switch *is* thrown:

µW Path: FByp,On

µW Path Control Auto

In VMA, WLAN, 5G NR, CQM Modes, an **Auto/Man** switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Always Presel Bypass

Measurement	When µW Path Control is in Auto
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass

Measurement	When µW Path Control is in Auto
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM Modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

Low Noise Path Enable provides a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- The internal preamp is not installed, or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

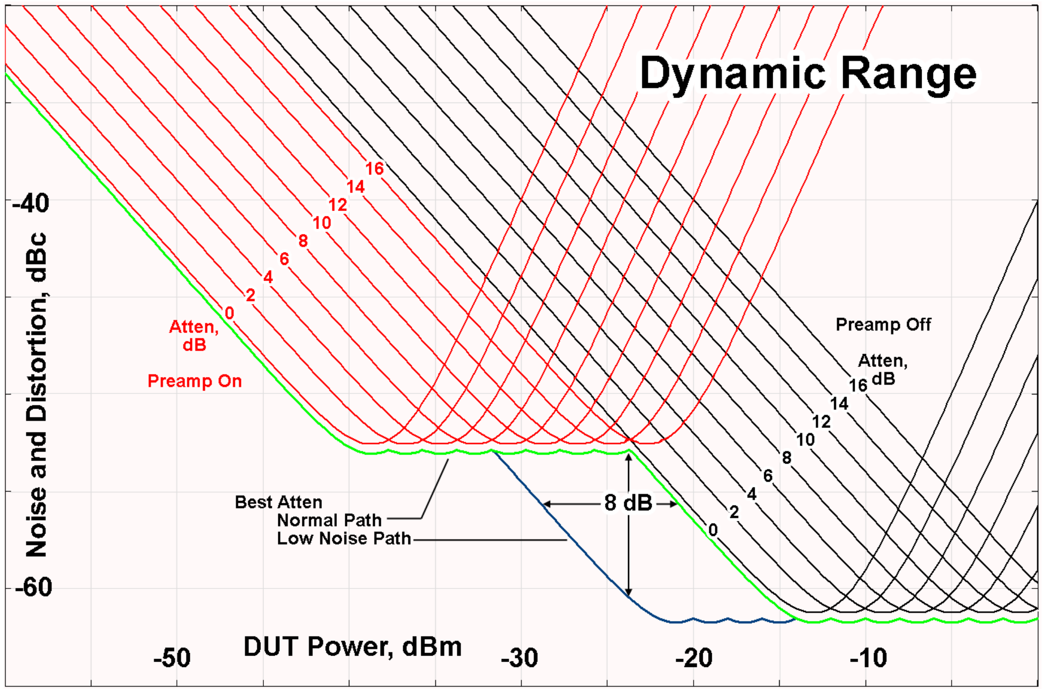
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1 (Fast Sweep Capability) is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever *all* the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or if installed, is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION	When **Full Bypass Enable** is selected, and "Y Scale" on page 1929 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at considerable risk to be damaged by high AC power. Consequently,

whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

“Full Bypass Enabled, maximum safe input power reduced”

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Only applies to the high frequency path of the Frequency Extender, and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and *does* allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out-of-band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Preselector and Bandwidth Conflict

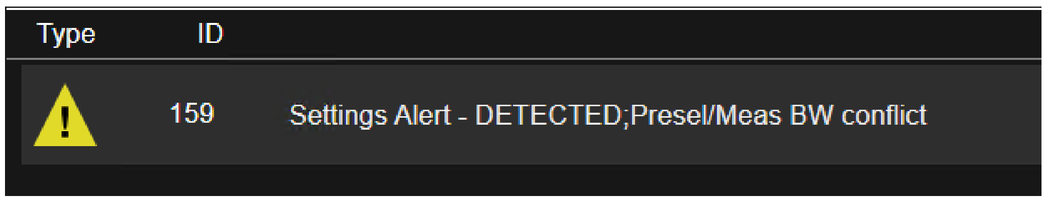
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In N9041B, **Software Preselection** only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if turned on, it is not used for other inputs, and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in N9041B, in Swept SA measurement, **Software Preselection** works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that for N9042B+V3050A, in the Swept SA measurement, Software Preselection works even if the measurement is using an FFT Sweep Type. In measurements other than Swept SA, Software Preselection is not used if the measurement is using an FFT Sweep Type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but you should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals

Because of the difficulty in identifying spurs manually, you are recommended to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Affects **Sweep Time** **Auto Tune** supports **Software Preselection**, so **Auto Tune** should be performed after setting the **Software Preselection** state
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps occur in succession. The second sweep is offset in LO frequency by 2 * IF / N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images, which are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as "max hold" or trace averaging) is performed on the points of both candidate traces before the "select minimum" operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is `OFF`. The grayout message is "Unavailable unless SW Presel enabled"
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The options are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied

bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)

– NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method Grayed-out when "Software Preselection" on page 1971 is OFF. The grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A, the parameter is SCPI-only, and always set to NARRow when **Software Preselection** is enabled
Preset	N9041B: NORMal N9042B+V3050A: NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for center frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	Enable High Freq Prefilter for the Complex Spectrum Measurement in BASIC Mode:
	`:SPEC:PFIL ON`
	Enable High Freq Prefilter for the IQ Waveform Measurement, in multiple Modes:
	`:WAV:PFIL ON`
	Enable High Freq Prefilter for the Swept SA Measurement in SA Mode:

	`:SAN:PFIL ON`
Dependencies	Only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See "Prefilter Presets" on page 1171 below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.6.4 BW

Opens the Bandwidth (**BW**) menu, which contains the Info BW control.

3.6.4.1 Settings

Contains basic bandwidth functions. It is the only tab under **BW**.

Info BW

Allows you to enter a frequency value to set the channel bandwidth that will be used for data acquisition. When in **Auto**, it is set to the value that covers carriers set by carrier configuration.

Remote Command	`[:SENSe]:PSTatistic:BANDwidth <freq>` `[:SENSe]:PSTatistic:BANDwidth?`	
Example	`:PST:BAND 8 MHz` `:PST:BAND?`	
Notes	Auto/Man is available only for 5G NR, LTE, LTETDD, LTEAFDD, LTEA TDD	
Preset	Depends on Mode and installed Options. See "Preset Values" on page 1172 below	
State Saved	Saved in instrument state	
Min	10 kHz	
Max	Hardware-dependent:	
	RF Input	– No Option = 10 MHz – WB (25 MHz or wider) = Hardware Option Limit
	I/Q Input (for I+jQ)	– No Option = 20 MHz – Option B25 = 50 MHz
Backwards Compatibility SCPI	`[:SENSe]:PSTatistic:BWIDth`	

Auto Function

Remote Command	`[:SENSe]:PSTatistic:BANDwidth:AUTO ON | OFF | 1 | 0` `[:SENSe]:PSTatistic:BANDwidth:AUTO`
Example	`:PST:BAND:AUTO 0` `:PST:BAND:AUTO?`
Preset	`ON`

Preset Values

Modes	Option	Preset Values
SA, WCDMA	All	5 MHz
CQM	All	10 MHz
LTEATDD, LTEAFDD, 5G NR	All	Automatically calculated

<table>
<tr><th>Modes</th><th>Option</th><th>Preset Values</th></tr>

3.6.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.6.5.1 View

Contains controls for selecting the current **View**, and for editing User Views.

View

See "Views" on page 1122.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
